# Change History

## Issue 04 (2019-09-10)

This is the 04 version.

Compared to last version, the following topics are changed.

Section	Change Description
2.1, 2.2	Updated description of the NPU.
8.6.1	Added specs of the NPU.

## Issue 03 (2019-08-07)

This is the 03 version.

Compared to last version, the following topics are changed.

Section	Change Description
2.2	Updated the frequency spec of DDR4.
2.2 and 8.6	Changed spec and feature description of nerual network accelerator.

## Issue 02 (2019-07-17)

This is the 02 version.

Compared to last version, the following topics are changed.

Section	Change Description
2.1, 2.2 and 8.5	Updated Vulkan 1.0 to Vulkan 1.1. Modified Mali-G52 MP6 to Mali-G52 MP4 (6EE)
2.2	Updated the figure.

## Issue 01 (2019-05-05)

This is the 01 version.

Compared to *A311D Datasheet (0.1)*, the following topics are changed.

Section	Change Description
3.3	Added a note that some GPIOAO pins can be reset by watchdog.
4	Modified the chapter title.
4.3	Added a note of ripple voltage after the table
4.4	Modified thermo resistance value.
4.5.1	Added two notes of min and max value of $R_{PD}$ explaining the GPIO pin voltage in test condition.
4.7.1	Added note after Table 4-2 that driving strength of OD pin is not adjustabe.
4.7.7	<ul style="list-style-type: none"> <li>● Modified the specs of tHC, tLC and tRC in Table 4-14 and Table 4-15</li> <li>● Updated timing figures from Figure 4-16 to Figure 4-19.</li> </ul>
5 and 6	Changed these two sections into chapters.
6	Updated the power on sequence figure.
7	Updated the dimension figure.
14.2	Removed spec of PCIE.
14.3.3.2	Modified register description of ETH_PHY_CNTL1.
14.6.3	Corrected a typo.

# 1. About This Documentation

## 1.1 Documentation Overview

This documentation is an overall description of Amlogic advanced AI application processor A311D designed for hybrid OTT/IP Set Top Box(STB) and high-end media box applications, providing programmers instructions from the following aspects: system, video path, audio path, memory interfaces, I/O interfaces and system interfaces.

## 1.2 Acronyms and Abbreviations

**Table 1-1 Acronyms and Abbreviations**

<b>A</b>		
AHB	AMBA High-speed Bus	A bus protocol designed for the connection and management of functional blocks in system-on-a-chip (SoC) designs
APB	Advanced Peripheral Bus	A bus protocol designed for low bandwidth control accesses
<b>D</b>		
DMAC	Direct Memory Access Controller	An engine connected to the DDR controller for the purposes of moving data to/from DDR memory.
DMC	DDR memory controller	An engine controls DDR
<b>E</b>		
eMMC	Embedded multimedia card	An architecture consisting of an embedded storage solution with MMC interface, flash memory and controller
<b>H</b>		
HDMI	High-Definition Multimedian Interface	A compact audio/video interface used for transmitting uncompressed digital data
<b>I</b>		
I2C	Inter-Integrated Circuit	An multi-master, multi-slave, single-ended, serial computer bus used for attaching lower-speed peripheral ICs to processors and microcontrollers.
I2S	Inter IC sound	An electrical serial bus interface standard used for connecting digital audio device together
<b>P</b>		
PCM	Pulse Code Modulation	A method used to digitally represent sampled analog signals
PDM	Pulse Density Modulation	A method used to represent an analog signal with digital signal
<b>S</b>		
SPI	Synchronous Peripheral Interface	A synchronous serial data link standard operating in full duplex mode, devices communicate in master/slave mode where the master device initiates the data frame

## 2. General Information

### 2.1 Overview

A311D is an advanced AI application processor designed for hybrid OTT/IP Set Top Box(STB) and high-end media box applications. It integrates a powerful CPU, GPU and NPU <sup>optional</sup> (neural network accelerator) subsystem, a secured 4K video CODEC engine and a best-in-class HDR image processing pipeline with all major peripherals to form the ultimate high-performance AI multimedia AP.

The main system CPU is based on Big.Little architecture which integrates a quad-core ARM Cortex-A73 CPU cluster and a dual-core Cortex-A53 cluster with united L2 cache to improve system performance. Each CPU core includes the separate NEON SIMD co-processor to improve software media processing capability. There is also the NPU supporting INT8 inference for all popular deep learning frameworks including TensorFlow and Caffe.

The graphic subsystem consists of two graphic engines and a flexible video/graphic output pipeline. The ARM Mali™-G52 MP4(6EE) GPU handles all OpenGL ES 3.2 Vulkan 1.1 and OpenCL 2.0 graphic programs, while the 2.5D graphics processor handles additional scaling, alpha, rotation and color space conversion operations. Together, the CPU and GPU handle all operating system, networking, user-interface and gaming related tasks. The video output pipeline includes Dolby Vision<sup>optional</sup>, advanced HDR10, HDR10+, HLG and PRIME HDR processing, REC709/BT2020 processing, motion adaptive edge enhancing de-interlacing, flexible programmable scalar, and many picture enhancement filters before passing the enhanced image to the video output ports.

Amlogic Video Engine (AVE-10) offloads the Cortex-A53 CPUs from all video CODEC processing. It includes dedicated hardware video decoder and encoder. AVE-10 is capable of decoding 4Kx2K resolution video at 75fps with complete Trusted Video Path (TVP) for secure applications and supports full formats including MVC, MPEG-1/2/4, VC-1/WMV, AVS, AVS+, AVS2 RealVideo, MJPEG streams, H.264, H265-10, VP9 and also JPEG pictures with no size limitation. The independent encoder is able to encode in JPEG or H.265/H.264 up to 1080p at 60fps.

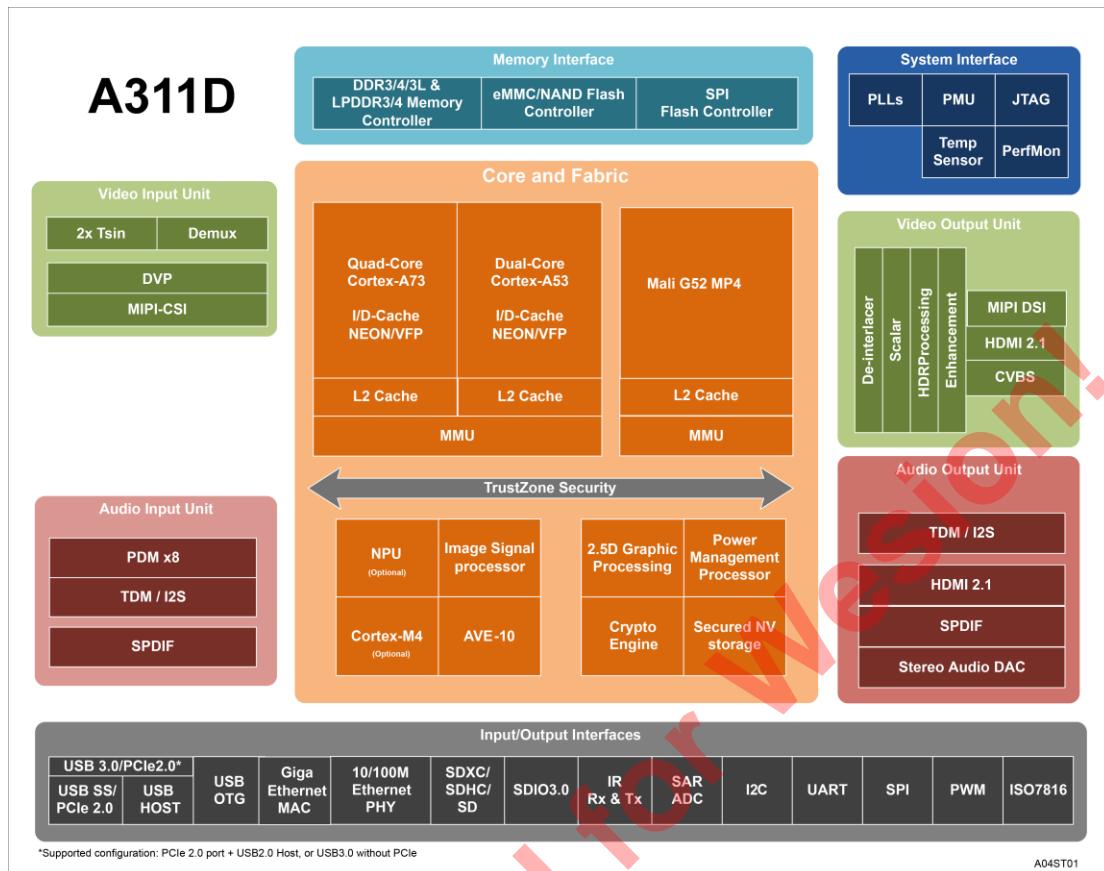

A311D integrates all standard audio/video input/output interfaces including a HDMI2.1 transmitter with 3D, Dynamic HDR, CEC and HDCP 2.2 support, stereo audio DAC, a CVBS output, 4-lane MIPI DSI interface, multiple TDM, PCM, I2S and SPDIF digital audio input/output interfaces, and 8 channel far-field PDM digital microphone (DMIC) inputs. A 4-lane MIPI-CSI and DVP interface is available to support up to 8MP camera input with the built-in high-quality ISP.

A311D also integrates a set of functional blocks for digital TV broadcasting streams. The built-in two demux can process the TV streams from the serial and parallel transport stream input interface, which can connect to external tuner/demodulator.

The processor has rich advanced network and peripheral interfaces, including a 10/100/1000M Ethernet MAC with RGMII, 10/100M Ethernet PHY, one USB XHCI OTG 2.0 ports, one USB3.0 and PCIe 2.0 combo interface and multiple SDIO/SD card controllers, UART, I2C, high-speed SPI and PWMs.

Standard ~~development~~ environment utilizing GNU/GCC Android tool chain is supported. Please contact your AMLOGIC sales representative for more information.

## 2.2 Features

### CPU Sub-system

- Quad core ARM Cortex-A73 and dual core ARM Cortex-A53 CPU
- ARMv8-A architecture with Neon and Crypto extensions
- Unified system L2 cache
- Build-in Cortex-M4 core for always on processing
- Advanced TrustZone security system
- Application based traffic optimization using internal QoS-based switching fabrics

### NPU

- Neural network accelerator (NNA) with programmable engine (PPU) architecture
- 4 NNA with INT8 inference performance up to 5Tops
- 1 programmable processing unit (PPU) up to 12.8 GFLOPS FP16 or 6.4 GFLOPS FP32
- 512KB cache and 1MB on chip buffer

### 3D Graphics Processing Unit

- ARM G52 MP4(6EE) GPU
- 8-wide warps, 2x dual texture pipe, 6x 8-wide execution engines (EE)
- Concurrent multi-core processing
- OpenGL ES 3.2, Vulkan 1.1 and OpenCL 2.0 support

### 2.5D Graphics Processor

- Fast bitblt engine with dual inputs and single output

- Programmable raster operations (ROP)
- Programmable polyphase scaling filter
- Supports multiple video formats 4:2:0, 4:2:2 and 4:4:4 and multiple pixel formats (8/16/24/32 bits graphics layer)
- Fast color space conversion
- Advanced anti-flickering filter

### Crypto Engine

- AES/ block cipher with 128/256 bits keys, standard 16 bytes block size and streaming ECB, CBC and CTR modes
- TDES block cipher with ECB and CBC modes supporting 64 bits key for DES and 192 bits key for 3DES
- Hardware crypto key-ladder operation and DVB-CSA for transport stream encryption
- Built-in hardware True Random Number Generator (TRNG), CRC and SHA-1/SHA-2/HMAC SHA engine

### Video/Picture CODEC

- Amlogic Video Engine (AVE) with dedicated hardware decoders and encoders
- Support multi-video decoder up to 4Kx2K@60fps+1x1080P@60fps
- Supports multiple “secured” video decoding sessions and simultaneous decoding and encoding
- Video/Picture Decoding
  - VP9 Profile-2 up to 4Kx2K@60fps
  - H.265 HEVC MP-10@L5.1 up to 4Kx2K@60fps
  - AVS2-P2 Profile up to 4Kx2K@60fps
  - H.264 AVC HP@L5.1 up to 4Kx2K@30fps
  - H.264 MVC up to 1080P@60fps
  - MPEG-4 ASP@L5 up to 1080P@60fps (ISO-14496)
  - WMV/VC-1 SP/MP/AP up to 1080P@60fps
  - AVS-P16(AVS+)/AVS-P2 JiZhun Profile up to 1080P@60fps
  - MPEG-2 MP/HL up to 1080P@60fps (ISO-13818)
  - MPEG-1 MP/HL up to 1080P@60fps (ISO-11172)
  - RealVideo 8/9/10 up to 1080P@60fps
  - Multiple language and multiple format sub-title video support
  - MJPEG and JPEG unlimited pixel resolution decoding (ISO/IEC-10918)
  - Supports JPEG thumbnail, scaling, rotation and transition effects
  - Supports \*.mkv, \*.wmv, \*.mpg, \*.mpeg, \*.dat, \*.avi, \*.mov, \*.iso, \*.mp4, \*.rm and \*.jpg file formats
- Video/Picture Encoding
  - Independent JPEG and H.265/H.264 encoder with configurable performance/bit-rate
  - JPEG image encoding
  - H.265/H.264 video encoding up to 1080P@60fps with low latency
  - DVP (ITU 601/656) camera interface
  - Supports YUV or RGB camera input formats

### 9<sup>th</sup> Generation Advanced Amlogic TruLife Image Engine

- Supports Dolby Vision<sup>Optional</sup>, HDR10, HDR10+, and HLG HDR
- Motion compensated noise reduction and 3D digital noise reduction for random noise
- Block noise, mosquito noise, spatial noise, contour noise reduction

- Motion compensated and motion adaptive de-interlacer
- Edge interpolation with low angle protection and processing
- 3:2/2:2 pulldown and Video on Film (VOF) detection and processing
- Smart sharpness with SuperScaler technology including de-contouring, de-ring, LTI, CTI, de-jaggy, peaking
- Dynamic non-Linear contrast enhancement
- 3D LUTs with 17x17x17 nodes, provide 4913 different control points, which is competent for matching calibrated displays to a target colorspace
- High precision HSL color space-based color management with low saturation protection, independent luma/hue/saturation adjustment to achieve blue/green extension, fresh tone correction, and wider gamut for video
- 2 video planes and 3 graphics planes
- Independent HDR re-mapping of video and graphic layer

### Camera Interface

- DVP parallel and MIPI-CSI camera interface with 4 lanes
- Supports RAW, YUV or RGB camera input formats
- Built-in 8MP HDR Image Signal Processor (ISP)
- Built-in image distortion correction engine

### Video Output

- Built-in HDMI 2.1 transmitter including both controller and PHY with CEC, Dynamic HDR and HDCP 2.2, 4Kx2K@60 max resolution output
- CVBS 480i/576i standard definition output
- Supports all standard SD/HD/FHD video output formats: 480i/p, 576i/p, 720p, 1080i/p and 4Kx2K
- 4-lane MIPI DSI interface, resolution up to 1920\*1080 with rotation and panel calibration

### Audio Decoder and Input/Output

- Supports MP3, AAC, WMA, RM, FLAC, Ogg, Dolby Digital <sup>optional</sup>, Dolby Digital Plus <sup>optional</sup>, DTS <sup>optional</sup> and programmable with 7.1/5.1 down-mixing
- Built-in serial digital audio SPDIF/IEC958 input/output and PCM input/output
- 3 built-in TDM/PCM/I2S ports with TDM/PCM mode up to 384kHz x32bits x 8ch or 96kHz x 32bits x 32ch and I2S mode up to 384kHz x 32bits x 8ch
- Digital microphone PDM voice input with programmable CIC, LPF & HPF, support up to 8 DMICs
- Built-in stereo audio DAC
- Supports concurrent dual audio stereo channel output with combination of analog+PCM or I2S+PCM

### Memory and Storage Interface

- 32-bit DRAM memory interface with dual ranks and max 4GB total address space
- Compatible with JEDEC standard DDR3-2133 /DDR3L-2133 /DDR4-3200 /LPDDR3-2133 /LPDDR4-3200 SDRAM
- Supports SLC/MLC/TLC NAND Flash with 60-bit ECC, compatible to Toshiba toggle mode in addition to ONFI 2.2
- SDSC/SDHC/SDXC card and SDIO interface with 1-bit and 4-bit data bus width supporting spec version 2.x/3.x/4.x DS/HS modes up to UHS-I SDR104
- eMMC and MMC card interface with 1/4/8-bit data bus width fully supporting spec version 5.0 HS200
- Supports serial 1, 2 or 4-bit NOR Flash via SPI interface

- Built-in 4k bits One-Time-Programming memory for key storage

## Network

- Integrated IEEE 802.3 10/100/1000M Ethernet MAC with RGMII interface
- Integrated 10<sup>Note1</sup>/100M Ethernet PHY interface
- WiFi/IEEE802.11 & Bluetooth supporting via PCIE/SDIO /USB/UART/PCM
- Network interface optimized for mixed WIFI and BT traffic

## Digital Television Interface

- One serial and one parallel Transport stream (TS) input interface with built-in demux processor for connecting to external digital TV tuner/demodulator
- Built-in PWM, I2C and SPI interfaces to control tuner and demodulator
- Integrated ISO 7816 smart card controller

## Integrated I/O Controllers and Interfaces

- One USB XHCI OTG 2.0 port
- One USB SS and PCIe 2.0 combo interface up to 5Gbps, supporting 2 configurations:
  - 1 USB 2.0 Host + 1 PCIe
  - 1 USB3.0 (No PCIe)
- Multiple PWM, UART, I2C and SPI interface with slave select
- Programmable IR remote input/output controllers
- Built-in 10bit SAR ADC with 4 input channels
- A set of General Purpose IOs with built-in pull up and pull down

## System, Peripherals and Misc. Interfaces

- Integrated general purpose timers, counters, DMA controllers
- 24 MHz crystal input
- Embedded debug interface using ICE/JTAG

## Power Management

- Multiple internal power domains controlled by software
- Multiple sleep modes for CPU, system, DRAM, etc.
- Multiple internal PLLs to adjust the operating frequencies
- Multi-voltage I/O design for 1.8V and 3.3V
- Power management auxiliary processor in a dedicated always-on (AO) power domain for system stand-by

## Security

- Trustzone based Trusted Execution Environment (TEE)
- Secured boot, encrypted OTP, encrypted DRAM with memory integrity checker, hardware key ladder and internal control buses and storage
- Separated secure/non-secure Entropy true RNG
- Pre-region/ID memory security control and electric fence
- Hardware based Trusted Video Path (TVP), video watermarking and secured contents (needs SecureOS software)
- Secured IO and secured clock

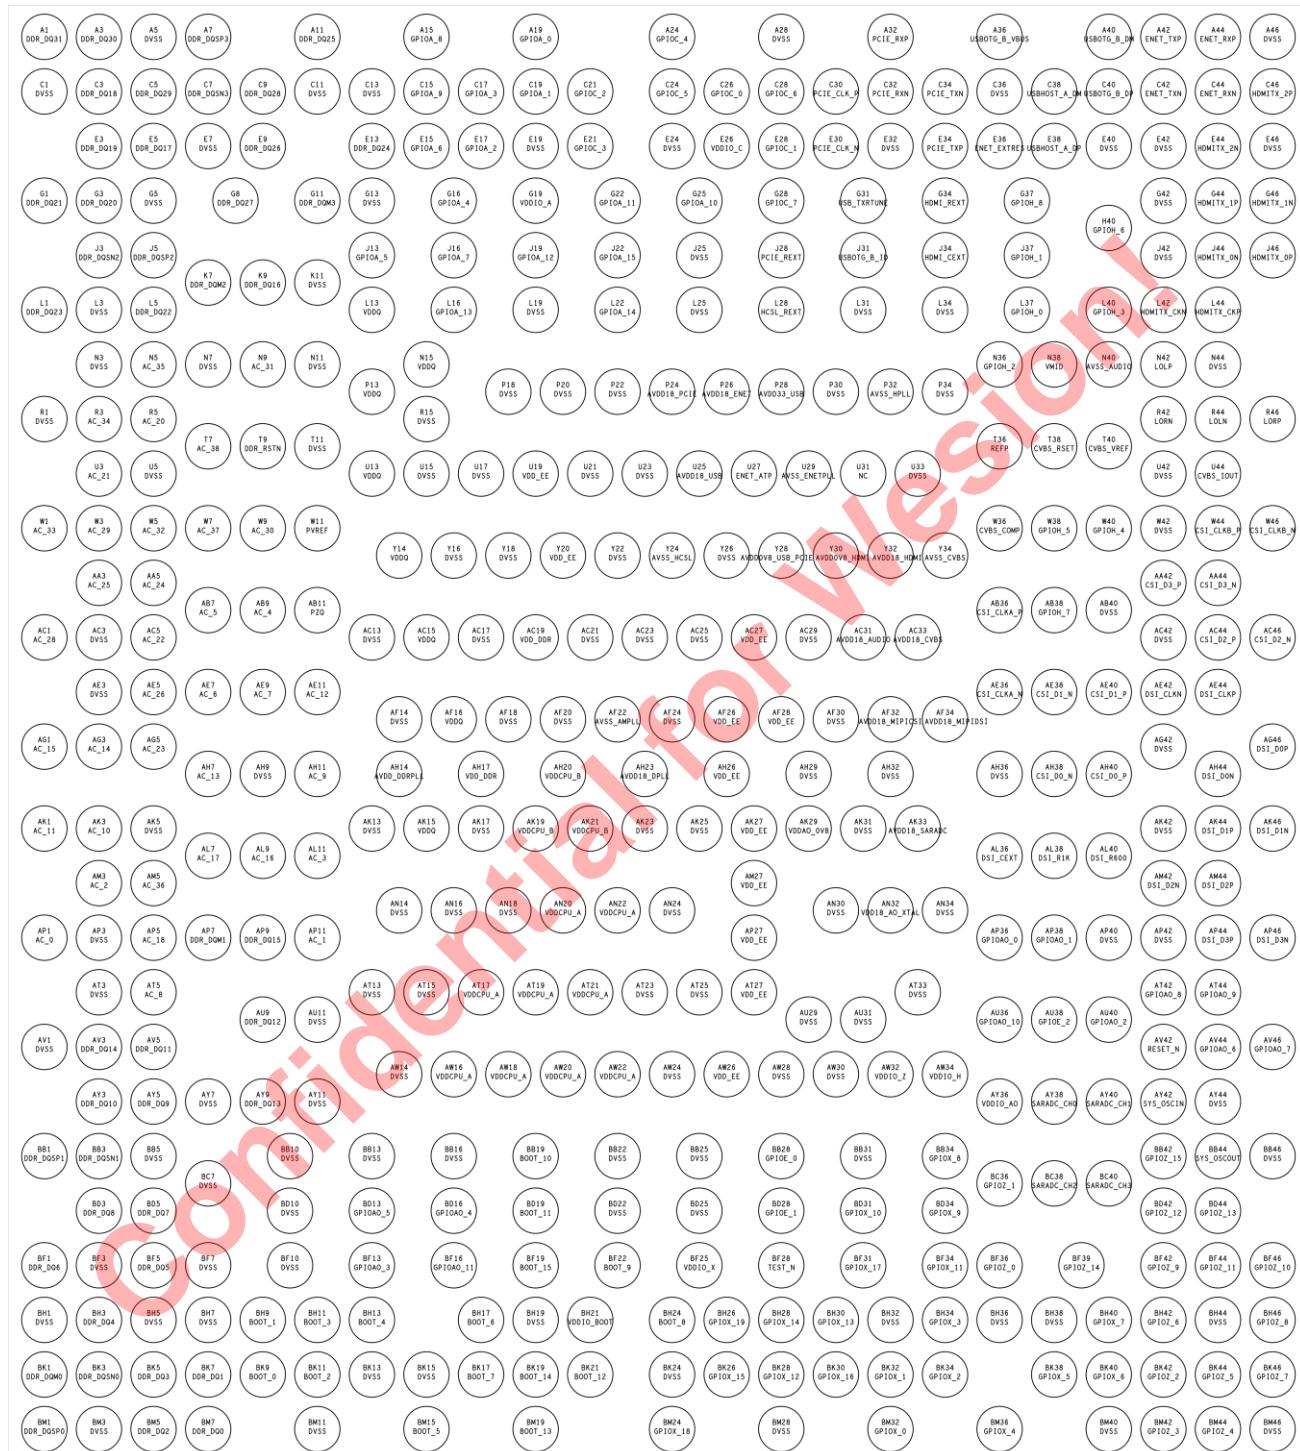

## Package

- FCBGA, 16.1mmx14.3mm, 0.6mm ball pitch, RoHS compliant

Note1: 10Base-T not support CTS mode

### **3. Pin Out Specification**

### 3.1 Pin-Out Diagram (top view)

## 3.2 Pin Order

**Table 3-1. Pin Order**

BALL #	NET NAME	BALL #	NET NAME	BALL #	NET NAME
A1	DDR_DQ31	E15	GPIOA_6	J34	HDMI_CEXT
A3	DDR_DQ30	E17	GPIOA_2	J37	GPIOH_1
A5	DVSS	E19	DVSS	J42	DVSS

### 3.3 Pin Description

The A311D application processor pin assignment is described in the following table.

**Table 3-2. Pin Name assignments**

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
<b>GPIOZ - Refer to</b> Table 3-3 for functional multiplex information.					
GPIOZ_0	DIO	Up	General purpose input/output bank Z signal 0	VDDIO_Z	NC
GPIOZ_1	DIO	Up	General purpose input/output bank Z signal 1	VDDIO_Z	NC
GPIOZ_2	DIO	Up	General purpose input/output bank Z signal 2	VDDIO_Z	NC
GPIOZ_3	DIO	Up	General purpose input/output bank Z signal 3	VDDIO_Z	NC
GPIOZ_4	DIO	Up	General purpose input/output bank Z signal 4	VDDIO_Z	NC
GPIOZ_5	DIO	Up	General purpose input/output bank Z signal 5	VDDIO_Z	NC
GPIOZ_6	DIO	Up	General purpose input/output bank Z signal 6	VDDIO_Z	NC
GPIOZ_7	DIO	Up	General purpose input/output bank Z signal 7	VDDIO_Z	NC
GPIOZ_8	DIO	Up	General purpose input/output bank Z signal 8	VDDIO_Z	NC
GPIOZ_9	DIO	Down	General purpose input/output bank Z signal 9	VDDIO_Z	NC
GPIOZ_10	DIO	Down	General purpose input/output bank Z signal 10	VDDIO_Z	NC
GPIOZ_11	DIO	Down	General purpose input/output bank Z signal 11	VDDIO_Z	NC
GPIOZ_12	DIO	Down	General purpose input/output bank Z signal 12	VDDIO_Z	NC
GPIOZ_13	DIO	Down	General purpose input/output bank Z signal 13	VDDIO_Z	NC
GPIOZ_14	OD 3.3V	Z	OD input/output bank Z signal 14	VDDIO_Z	NC
GPIOZ_15	OD 3.3V	Z	OD input/output bank Z signal 15	VDDIO_Z	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
VDDIO_Z	P	-	Power supply for GPIO bank Z	-	NC
<b>GPIOA</b> - Refer to Table 3-4 for functional multiplex information.					
GPIOA_0	DIO	Down	General purpose input/output bank A signal 0	VDDIO_A	NC
GPIOA_1	DIO	Down	General purpose input/output bank A signal 1	VDDIO_A	NC
GPIOA_2	DIO	Down	General purpose input/output bank A signal 2	VDDIO_A	NC
GPIOA_3	DIO	Down	General purpose input/output bank A signal 3	VDDIO_A	NC
GPIOA_4	DIO	Down	General purpose input/output bank A signal 4	VDDIO_A	NC
GPIOA_5	DIO	Down	General purpose input/output bank A signal 5	VDDIO_A	NC
GPIOA_6	DIO	Down	General purpose input/output bank A signal 6	VDDIO_A	NC
GPIOA_7	DIO	Down	General purpose input/output bank A signal 7	VDDIO_A	NC
GPIOA_8	DIO	Down	General purpose input/output bank A signal 8	VDDIO_A	NC
GPIOA_9	DIO	Down	General purpose input/output bank A signal 9	VDDIO_A	NC
GPIOA_10	DIO	Down	General purpose input/output bank A signal 10	VDDIO_A	NC
GPIOA_11	DIO	Down	General purpose input/output bank A signal 11	VDDIO_A	NC
GPIOA_12	DIO	Down	General purpose input/output bank A signal 12	VDDIO_A	NC
GPIOA_13	DIO	Down	General purpose input/output bank A signal 13	VDDIO_A	NC
GPIOA_14	DIO	Up	General purpose input/output bank A signal 14	VDDIO_A	NC
GPIOA_15	DIO	Up	General purpose input/output bank A signal 15	VDDIO_A	NC
VDDIO_A	P	-	Power supply for GPIO bank A	-	NC
<b>BOOT</b> - Refer to Table 3-5 for functional multiplex information.					

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
BOOT_0	DIO	UP	General purpose input/output bank BOOT signal 0	VDDIO_BOOT	NC
BOOT_1	DIO	UP	General purpose input/output bank BOOT signal 1	VDDIO_BOOT	NC
BOOT_2	DIO	UP	General purpose input/output bank BOOT signal 2	VDDIO_BOOT	NC
BOOT_3	DIO	UP	General purpose input/output bank BOOT signal 3	VDDIO_BOOT	NC
BOOT_4	DIO	UP	General purpose input/output bank BOOT signal 4	VDDIO_BOOT	NC
BOOT_5	DIO	UP	General purpose input/output bank BOOT signal 5	VDDIO_BOOT	NC
BOOT_6	DIO	UP	General purpose input/output bank BOOT signal 6	VDDIO_BOOT	NC
BOOT_7	DIO	UP	General purpose input/output bank BOOT signal 7	VDDIO_BOOT	NC
BOOT_8	DIO	UP	General purpose input/output bank BOOT signal 8	VDDIO_BOOT	NC
BOOT_9	DIO	UP	General purpose input/output bank BOOT signal 9	VDDIO_BOOT	NC
BOOT_10	DIO	UP	General purpose input/output bank BOOT signal 10	VDDIO_BOOT	NC
BOOT_11	DIO	UP	General purpose input/output bank BOOT signal 11	VDDIO_BOOT	NC
BOOT_12	DIO	DOWN	General purpose input/output bank BOOT signal 12	VDDIO_BOOT	NC
BOOT_13	DIO	DOWN	General purpose input/output bank BOOT signal 13	VDDIO_BOOT	NC
BOOT_14	DIO	UP	General purpose input/output bank BOOT signal 14	VDDIO_BOOT	NC
BOOT_15	DIO	UP	General purpose input/output bank BOOT signal 15	VDDIO_BOOT	NC
VDDIO_BOOT	P	-	Power supply for GPIO bank BOOT	-	To VDDIO_BOOT
<b>GPIOC</b> - Refer to Table 3-6 for functional multiplex information.					
GPIOC_0	DIO	UP	General purpose input/output bank C signal 0	VDDIO_C	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
GPIOC_1	DIO	UP	General purpose input/output bank C signal 1	VDDIO_C	NC
GPIOC_2	DIO	UP	General purpose input/output bank C signal 2	VDDIO_C	NC
GPIOC_3	DIO	UP	General purpose input/output bank C signal 3	VDDIO_C	NC
GPIOC_4	DIO	UP	General purpose input/output bank C signal 4	VDDIO_C	NC
GPIOC_5	DIO	UP	General purpose input/output bank C signal 5	VDDIO_C	NC
GPIOC_6	DIO	UP	General purpose input/output bank C signal 6	VDDIO_C	NC
GPIOC_7	OD3.3V	Z	OD input/output bank C signal 7	VDDIO_C	NC
VDDIO_C	P	-	Power supply for GPIO bank C	-	NC

**GPIOX** - Refer to Table 3-7 for functional multiplex information.

GPIOX_0	DIO	Up	General purpose input/output bank X signal 0	VDDIO_X	NC
GPIOX_1	DIO	Up	General purpose input/output bank X signal 1	VDDIO_X	NC
GPIOX_2	DIO	Up	General purpose input/output bank X signal 2	VDDIO_X	NC
GPIOX_3	DIO	Up	General purpose input/output bank X signal 3	VDDIO_X	NC
GPIOX_4	DIO	Up	General purpose input/output bank X signal 4	VDDIO_X	NC
GPIOX_5	DIO	Up	General purpose input/output bank X signal 5	VDDIO_X	NC
GPIOX_6	DIO	Down	General purpose input/output bank X signal 6	VDDIO_X	NC
GPIOX_7	DIO	Up	General purpose input/output bank X signal 7	VDDIO_X	NC
GPIOX_8	DIO	Up	General purpose input/output bank X signal 8	VDDIO_X	NC
GPIOX_9	DIO	Up	General purpose input/output bank X signal 9	VDDIO_X	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
GPIOX_10	DIO	Up	General purpose input/output bank X signal 10	VDDIO_X	NC
GPIOX_11	DIO	Up	General purpose input/output bank X signal 11	VDDIO_X	NC
GPIOX_12	DIO	Up	General purpose input/output bank X signal 12	VDDIO_X	NC
GPIOX_13	DIO	Up	General purpose input/output bank X signal 13	VDDIO_X	NC
GPIOX_14	DIO	Up	General purpose input/output bank X signal 14	VDDIO_X	NC
GPIOX_15	DIO	Up	General purpose input/output bank X signal 15	VDDIO_X	NC
GPIOX_16	DIO	Up	General purpose input/output bank X signal 16	VDDIO_X	NC
GPIOX_17	DIO	Down	General purpose input/output bank X signal 17	VDDIO_X	NC
GPIOX_18	DIO	Up	General purpose input/output bank X signal 18	VDDIO_X	NC
GPIOX_19	DIO	Z	General purpose input/output bank X signal 19	VDDIO_X	NC
VDDIO_X	P	-	Power supply for GPIO bank X	-	NC

**GPIOH** - Refer to Table 3-8 for functional multiplex information.

GPIOH_0	OD5V	Z	OD input/output bank H signal 0	VDDIO_H	NC
GPIOH_1	OD5V	Z	OD input/output bank H signal 1	VDDIO_H	NC
GPIOH_2	OD5V	Z	OD input/output bank H signal 2	VDDIO_H	NC
GPIOH_3	OD5V	Z	OD input/output bank H signal 3	VDDIO_H	NC
GPIOH_4	DIO	DOWN	General purpose input/output bank H signal 4	VDDIO_H	NC
GPIOH_5	DIO	DOWN	General purpose input/output bank H signal 5	VDDIO_H	NC
GPIOH_6	DIO	DOWN	General purpose input/output bank H signal 6	VDDIO_H	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
GPIOH_7	DIO	DOWN	General purpose input/output bank H signal 7	VDDIO_H	NC
GPIOH_8	OD5V	Z	OD input/output bank H signal 8	VDDIO_H	NC
VDDIO_H	P	-	Power supply for GPIO bank H	-	NC

**GPIOAO** - Refer to Table 3-9 for functional multiplex information.

The following pins can be reset by watchdog: GPIOAO\_0, GPIOAO\_1, GPIOAO\_2, GPIOAO\_4, GPIOAO\_6, GPIOAO\_7, GPIOAO\_10, TEST\_N (only output reg and pull up/down).

GPIOAO_0	DIO	Up	General purpose input/output bank AO signal 0	VDDIO_AO	NC
GPIOAO_1	DIO	Up	General purpose input/output bank AO signal 1	VDDIO_AO	NC
GPIOAO_2	DIO	Down	General purpose input/output bank AO signal 2	VDDIO_AO	NC
GPIOAO_3	DIO	Up	General purpose input/output bank AO signal 3	VDDIO_AO	NC
GPIOAO_4	DIO	Down	General purpose input/output bank AO signal 4	VDDIO_AO	NC
GPIOAO_5	DIO	Up	General purpose input/output bank AO signal 5	VDDIO_AO	NC
GPIOAO_6	DIO	Down	General purpose input/output bank AO signal 6	VDDIO_AO	NC
GPIOAO_7	DIO	Up	General purpose input/output bank AO signal 7	VDDIO_AO	NC
GPIOAO_8	DIO	Up	General purpose input/output bank AO signal 8	VDDIO_AO	NC
GPIOAO_9	DIO	Down	General purpose input/output bank AO signal 9	VDDIO_AO	NC
GPIOAO_10	DIO	Up	General purpose input/output bank AO signal 10	VDDIO_AO	NC
GPIOAO_11	DIO	Down	General purpose input/output bank AO signal 11	VDDIO_AO	NC
TEST_N	DIO	UP	SOC test pin and general purpose input/output bank AO signal 12. Should be pulled up during normal power-on.	VDDIO_AO	NC
RESET_N	Input	DOWN	System reset input	VDDIO_AO	To RESET_N

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
VDDIO_AO	P	-	Power supply for GPIO bank AO	VDDIO_AO	To VDDIO_AO
<b>GPIOE-</b> Refer to Table 3-10 for functional multiplex information.					
GPIOE_0	DIO	Z	General purpose input/output bank E signal 0	VDD18_AO_XTAL	NC
GPIOE_1	DIO	Z	General purpose input/output bank E signal 1	VDD18_AO_XTAL	NC
GPIOE_2	DIO	Z	General purpose input/output bank E signal 2	VDD18_AO_XTAL	NC
VDD18_AO_XTAL	P	-	Power supply for GPIO bank E and XTAL, IOVREF	-	To VDD18_AO_XTAL
<b>SARADC</b>					
SARADC_CH0	AI	-	ADC channel 0 input	AVDD18_SARADC	NC
SARADC_CH1	AI	-	ADC channel 1 input	AVDD18_SARADC	NC
SARADC_CH2	AI	-	ADC channel 2 input	AVDD18_SARADC	NC
SARADC_CH3	AI	-	ADC channel 3 input	AVDD18_SARADC	NC
AVDD18_SARADC	P	-	Analog power supply for SARADC	-	To 1.8V
<b>CVBS OUT</b>					
CVBS_COMP	A	-	CVBS external compensation capacitor connection	AVDD18_CVBS	NC
CVBS_IOUT	AO	-	Video DAC output	AVDD18_CVBS	NC
CVBS_RSET	A	-	CVBS output strength setting resistor	AVDD18_CVBS	NC
CVBS_VREF	A	-	CVBS reference voltage filter cap	AVDD18_CVBS	NC
AVDD18_CVBS	P	-	1.8 V Analog power supply for CVBS_OUT	-	To 1.8V
<b>HDMI TX</b>					
HDMITX_0P	AO	-	HDMI TMDS data0 positive output	NC	NC
HDMITX_0N	AO	-	HDMI TMDS data0 negative output	NC	NC
HDMITX_1P	AO	-	HDMI TMDS data1 positive output	NC	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
HDMITX_1N	AO	-	HDMI TMDS data1 negative output	NC	NC
HDMITX_2P	AO	-	HDMI TMDS data2 positive output	NC	NC
HDMITX_2N	AO	-	HDMI TMDS data2 negative output	NC	NC
HDMITX_CKP	AO	-	HDMI TMDS clock positive output	NC	NC
HDMITX_CKN	AO	-	HDMI TMDS clock negative output	NC	NC
HDMI_REXT	A	-	HDMI output strength setting resistor	HDMI_AVDD18	NC
HDMI_CEXT	A	-	HDMI TX external filter cap	HDMI_AVDD18	NC
AVDD18_HDMI	P	-	Analog power supply 1.8V for HDMI	-	To 1.8V
AVDD0V8_HDMI	P	-	Power supply 0.8V for HDMI	-	To VDD_EE

**DRAM-** Refer to Table 3-11 for functional multiplex information.

AC_0	DO	-	DDR PHY address/command/control signal bit 0	VDDQ	NC
AC_1	DO	-	DDR PHY address/command/control signal bit 1	VDDQ	NC
AC_2	DO	-	DDR PHY address/command/control signal bit 2	VDDQ	NC

DDR_DQM1	DIO	-	DRAM data mask 1	VDDQ	To DRAM
DDR_DQM2	DIO	-	DRAM data mask 2	VDDQ	NC
DDR_DQM3	DIO	-	DRAM data mask 3	VDDQ	NC
DDR_DQSP0	DIO	-	DRAM data strobe 0	VDDQ	To DRAM
DDR_DQSN0	DIO	-	DRAM data strobe 0 complementary	VDDQ	To DRAM
DDR_DQSP1	DIO	-	DRAM data strobe 1	VDDQ	To DRAM
DDR_DQSN1	DIO	-	DRAM data strobe 1 complementary	VDDQ	To DRAM
DDR_DQSP2	DIO	-	DRAM data strobe 2	VDDQ	NC
DDR_DQSN2	DIO	-	DRAM data strobe 2 complementary	VDDQ	NC
DDR_DQSP3	DIO	-	DRAM data strobe 3	VDDQ	NC
DDR_DQSN3	DIO	-	DRAM data strobe 3 complementary	VDDQ	NC
PZQ	A	-	DRAM reference pin for ZQ calibration, to GND by 240ohm.	VDDQ	To GND by 240ohm
PVREF	A	-	DRAM reference voltage	VDDQ	To GND by capacitor
AVDD_DDRPLL	P		Analog power supply for DDRPLL	-	To DDR VDDQ

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
<b>USB</b>					
USBHOST_A_DP	AIO	-	USB 2.0 Port A positive data signal (Host only)	AVDD33_USB	NC
USBHOST_A_DM	AIO	-	USB 2.0 Port A negative data signal (Host only)	AVDD33_USB	NC
USBOTG_B_DP	AIO	-	USB 2.0 Port B positive data signal (OTG)	AVDD33_USB	NC
USBOTG_B_DM	AIO	-	USB 2.0 Port B negative data signal (OTG)	AVDD33_USB	NC
USBOTG_B_ID	AIO	-	USB OTG mini-receptacle identifier (Internal 12.8KΩ pull-up resistor to AVDD18)	AVDD18_USB	NC
USBOTG_B_VBUS	AIO	-	USB OTG cable power detection	AVDD18_USB	NC
USB_TXRTUNE	AIO	-	USB 2.0 Port A B host output strength setting resistor	AVDD18_USB	NC
AVDD33_USB	P	-	3.3V Power supply for USB	-	To 3.3V
AVDD18_USB	P	-	1.8V Power supply for USB	-	To 1.8V
<b>Ethernet</b>					
ENET_ATP	AIO	-	Ethernet PHY analog test pin	AVDD18_NET	NC
ENET_EXTRES	A	-	Ethernet PHY external resistor connection	AVDD18_NET	NC
ENET_RXN	AIO	-	Ethernet PHY receive date negative input	AVDD18_NET	NC
ENET_RXP	AIO	-	Ethernet PHY receive data positive input	AVDD18_NET	NC
ENET_TXN	AIO	-	Ethernet PHY transmit data negative output	AVDD18_NET	NC
ENET_TXP	AIO	-	Ethernet PHY transmit data positive output	AVDD18_NET	NC
AVDD18_ENET	AP	-	Analog 1.8V power supply for Ethernet module	-	To 1.8V
<b>DSI</b>					
DSI_CEXT	A	-	MIPI DSI external filter capacitor	AVDD18_MIPIDSI	NC
DSI_CLKN	AO	-	MIPI DSI clock negative output	AVDD18_MIPIDSI	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
DSI_CLKP	AO	-	MIPI DSI clock positive output	AVDD18_MIPIDSI	NC
DSI_D0N	AIO	-	MIPI DSI data0 negative output or Bidirectional in LP mode	AVDD18_MIPIDSI	NC
DSI_D0P	AIO	-	MIPI DSI data0 positive output or Bidirectional in LP mode	AVDD18_MIPIDSI	NC
DSI_D1N	AO	-	MIPI DSI data1 negative output	AVDD18_MIPIDSI	NC
DSI_D1P	AO	-	MIPI DSI data1 positive output	AVDD18_MIPIDSI	NC
DSI_D2N	AO	-	MIPI DSI data2 negative output	AVDD18_MIPIDSI	NC
DSI_D2P	AO	-	MIPI DSI data2 positive output	AVDD18_MIPIDSI	NC
DSI_D3N	AO	-	MIPI DSI data3 negative output	AVDD18_MIPIDSI	NC
DSI_D3P	AO	-	MIPI DSI data3 positive output	AVDD18_MIPIDSI	NC
DSI_R1K	A	-	MIPI DSI reference current setting resistor with 1K ohm	AVDD18_MIPIDSI	NC
DSI_R600	A	-	MIPI DSI reference voltage setting resistor with 604 ohm	AVDD18_MIPIDSI	NC
AVDD18_MIPIDSI	AP	-	MIPI-DSI power supply	-	To 1.8V
<b>CSI</b>					
CSI_D0_N	AIO	-	MIPI CSI data 0 negative input	AVDD18_MIPICSI	NC
CSI_D0_P	AIO	-	MIPI CSI data 0 positive input	AVDD18_MIPICSI	NC
CSI_D1_N	AI	-	MIPI CSI data 1 negative input	AVDD18_MIPICSI	NC
CSI_D1_P	AI	-	MIPI CSI data 1 positive input	AVDD18_MIPICSI	NC
CSI_D2_N	AIO	-	MIPI CSI data 2 negative input	AVDD18_MIPICSI	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
CSI_D2_P	AIO	-	MIPI CSI data 2 positive input	AVDD18_MIPICSI	NC
CSI_D3_N	AI	-	MIPI CSI data 3 negative input	AVDD18_MIPICSI	NC
CSI_D3_P	AI	-	MIPI CSI data 3 positive input	AVDD18_MIPICSI	NC
CSI_CLKA_N	AI	-	MIPI CSI CLK negative input for channel A	AVDD18_MIPICSI	NC
CSI_CLKA_P	AI	-	MIPI CSI CLK positive input for channel A	AVDD18_MIPICSI	NC
CSI_CLKB_N	AI	-	MIPI CSI CLK negative input for channel B	AVDD18_MIPICSI	NC
CSI_CLKB_P	AI	-	MIPI CSI CLK positive input for channel B	AVDD18_MIPICSI	NC
AVDD18_MIPICSI	AP	-	MIPI-CSI power supply	-	To 1.8V
<b>Audio DAC</b>					
LOLN	AO	-	Audio DAC line-out left channel negative signal	AVDD18_Audio	NC
LOLP	AO	-	Audio DAC line-out left channel positive signal	AVDD18_Audio	NC
LORN	AO	-	Audio DAC line-out right channel negative signal	AVDD18_Audio	NC
LОРР	AO	-	Audio DAC line-out right channel positive signal	AVDD18_Audio	NC
REFP	A	-	Audio DAC positive reference voltage	AVDD18_Audio	NC
VMID	A	-	Audio DAC external filter cap connection	AVDD18_Audio	NC
AVDD18_AUDIO	AP	-	Analog 1.8V for Audio DAC	-	To 1.8V
AVSS_Audio	AP	-	Analog power ground for Audio DAC	-	To VSS
<b>PCIE</b>					
PCIE_CLK_n	AO	-	PCIE reference clock negative signal	AVDD18_PCIE	NC
PCIE_CLK_p	AO	-	PCIE reference clock positive signal	AVDD18_PCIE	NC

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
PCIE_REXT	AIO	-	PCIE output strength setting resistor	AVDD18_PCIE	NC
PCIE_RXN	AI	-	PCIE or USB3.0input negative signal	AVDD18_PCIE	NC
PCIE_RXP	AI	-	PCIE or USB3.0input positive signal	AVDD18_PCIE	NC
PCIE_TXN	AO	-	PCIE or USB3.0 output negative signal	AVDD18_PCIE	NC
PCIE_TXP	AO	-	PCIE or USB3.0output positive signal	AVDD18_PCIE	NC
AVDD0V8_USB_PCIE	AP	-	Analog 0.8V power supply for USB and PCIE	-	To VDD_EE
AVDD18_PCIE	AP	-	Analog 1.8V power supply for PCIE	-	To 1.8V
HCSL_REXT	AIO	-	PCIE reference clk output strength setting resistor	AVDD18_PCIE	NC
AVSS_HCSL	AP	-	Analog ground for PCIE reference module clock	-	To VSS
<b>System Clock &amp; PLL</b>					
SYS_OSCIN	AI	-	24MHz crystal oscillator input	VDD18_AO_XTAL	To XTAL
SYS_OSCOUT	AO	-	24MHz crystal oscillator output	VDD18_AO_XTAL	To XTAL
<b>Analog Power</b>					
AVDD18_DPLL	AP	-	Analog power of System PLL	-	To 1.8V
AVSS_ENETPLL	AP	-	Ground of Ethernet PLL	-	To GND
AVSS_AMPLL	AP	-	Ground of DDR AM_ PLL	-	To GND
AVSS_HPLL	AP	-	Ground of HDMI PLL	-	To GND
AVSS_PLL	AP	-	Ground of System PLL	-	To GND
AVSS_CVBS	AP		Ground of CVBS digital-analog converter	-	To GND
<b>Digital Power</b>					
VDDCPU_A	P	-	Power supply for CPU (Cortex A73)	-	To VDDCPU_A
VDDCPU_B	P	-	Power supply for CPU (Cortex A53)	-	To VDDCPU_B

Net Name	Type	Default Pull UP/DN	Description	Power Domain	If Unused
VDDQ	P	-	DDR IO Power supply for DDR PHY	-	To VDDQ
VDD_DDR	P	-	Core Power supply for DDR PHY	-	To VDD_EE
VDD_EE	P	-	Power supply for GPU and core logic	-	To VDD_EE
VDD18_AO_XTAL	P	-	1.8V Power supply for Always On Domain	-	To VDD18_AO_XTAL
VDDAO_0V8	P	-	0.8V power supply for AO, XTAL and M3/M4 CPU	-	To VDDAO_0V8
VDDIO_A	P	-	Power supply for GPIO bank A	-	NC
VDDIO_BOOT	P		Power supply for GPIO bank BOOT	-	NC
VDDIO_C	P		Power supply for GPIO bank C	-	NC
VDDIO_H	P		Power supply for GPIO bank H	-	NC
VDDIO_X	P		Power supply for GPIO bank X	-	NC
VDDIO_Z	P	-	Power supply for GPIO bank Z	-	NC
<b>Digital Ground</b>					
DVSS	P	-	Digital power ground	-	To GND

## Abbreviations:

- DI = Digital input pin
- DO = Digital output pin
- DIO = Digital input/output pin
- OD3.3V = 3.3V input tolerant open drain (OD) output pin, need external pull up
- OD5V = 5V input tolerant open drain (OD) output pin, need external pull up
- A = Analog setting or filtering pin
- AI = Analog input pin
- AO = Analog output pin
- AIO = Analog input/output pin
- P = Power pin
- AP = Analog power pin
- NC = No connection
- UP = Pull-Up

- DOWN = Pull-down
- Z = High-Z

## 3.4 Pin Multiplexing Tables

Multiple usage pins are used to conserve pin consumption for different features. The A311D devices can be used in many different applications but each application will not utilize all the on chip features. As a result, some of the features share the same pin. Most of the multiple usage pins can be used as a GPIO pin as well.

**Table 3-3. GPIOZ\_x Multi-Function Pin**

Pin Name	Fun1	Func2	Func3	Func4	Func5	Func6	Func7
GPIOZ_0	ETH_MDIO	BT656_A_VS	ISO7816_C_LK	I2C_EE_M0_SDA	PWM_B	-	-
GPIOZ_1	ETH_MDC	BT656_A_HS	ISO7816_D_ATA	I2C_EE_M0_SCL	PWM_C	-	-
GPIOZ_2	ETH_RGMII_RX_CLK	PWM_D	TSIN_B_VA_LID	TDMC_D0	SDCARD_D0	TDMC_DIN0	PDM_DIN0
GPIOZ_3	ETH_RX_DV	BT656_A_CLK	TSIN_B_SO_P	TDMC_D1	SDCARD_D1	TDMC_DIN1	PDM_DIN1
GPIOZ_4	ETH_RXD0	BT656_A_DIN0	TSIN_B_DIN0	TDMC_D2	SDCARD_D2	TDMC_DIN2	PDM_DIN2
GPIOZ_5	ETH_RXD1	BT656_A_DIN1	TSIN_B_CLK	TDMC_D3	SDCARD_D3	TDMC_DIN3	PDM_DIN3
GPIOZ_6	ETH_RXD2_R_GMII	BT656_A_DIN2	TSIN_B_FAI_L	TDMC_FS	SDCARD_C_LK	TDMC_SLV_FS	PDM_DCLK
GPIOZ_7	ETH_RXD3_R_GMII	BT656_A_DIN3	TSIN_B_DIN1	TDMC_SCL_K	SDCARD_C_MD	TDMC_SLV_SCLK	I2C_EE_M0_SDA

## 3.5 Signal Descriptions

**Table 3-13. SD Card Interface Signal Description**

Signal Name	Type	Description
SDCARD_D0	DIO	SD Card data bus bit 0 signal
SDCARD_D1	DIO	SD Card data bus bit 1 signal
SDCARD_D2	DIO	SD Card data bus bit 2 signal
SDCARD_D3	DIO	SD Card data bus bit 3 signal
SDCARD_CLK	DO	SD Card clock signal
SDCARD_CMD	DIO	SD Card command signal

**Table 3-14. SDIO Interface Signal Description**

Signal Name	Type	Description
SDIO_D0	DIO	SDIO data bus bit 0 signal
SDIO_D1	DIO	SDIO data bus bit 1 signal
SDIO_D2	DIO	SDIO data bus bit 2 signal
SDIO_D3	DIO	SDIO data bus bit 3 signal
SDIO_CLK	DO	SDIO clock signal
SDIO_CMD	DIO	SDIO command signal

**Table 3-15. Clock Interface Signal Description**

Signal Name	Type	Description
CLK_32K_IN	DI	32KHz clock input
CLK12_24	DO	12MHz/24MHz clock output
CLK25_EE	DO	25MHz clock output

**Table 3-16. UART Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
UART_AO_A_TX	DO	UART Port A data output in AO domain
UART_AO_A_RX	DI	UART Port A data input in AO domain
UART_AO_A_CTS	DI	UART Port A Clear To Send Signal in AO domain
UART_AO_A_RTS	DO	UART Port A Ready To Send Signal in AO domain
UART_AO_B_TX	DO	UART Port B data output in AO domain
UART_AO_B_RX	DI	UART Port B data input in AO domain
UART_AO_B_CTS	DI	UART Port B Clear To Send Signal in AO domain
UART_AO_B_RTS	DO	UART Port B Ready To Send Signal in AO domain
UART_EE_A_TX	DO	UART Port A data output in EE domain
UART_EE_A_RX	DI	UART Port A data input in EE domain
UART_EE_A_CTS	DI	UART Port A Clear To Send Signal in EE domain
UART_EE_A_RTS	DO	UART Port A Ready To Send Signal in EE domain
UART_EE_B_TX	DO	UART Port B data output in EE domain
UART_EE_B_RX	DI	UART Port B data input in EE domain
UART_EE_B_CTS	DI	UART Port B Clear To Send Signal in EE domain
UART_EE_B_RTS	DO	UART Port B Ready To Send Signal in EE domain
UART_EE_C_TX	DO	UART Port C data output in EE domain
UART_EE_C_RX	DI	UART Port C data input in EE domain
UART_EE_C_CTS	DI	UART Port C Clear To Send Signal in EE domain
UART_EE_C_RTS	DO	UART Port C Ready To Send Signal in EE domain

**Table 3-17. ISO7816 Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
ISO7816_DATA	DIO	ISO7816 data signal
ISO7816_CLK	DO	ISO7816 clock signal

**Table 3-18. TS In Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>

TSIN_A_DIN0	DI	Serial TS input port A data
TSIN_A_CLK	DI	TS input port A clock
TSIN_A_SOP	DI	TS input port A start of stream signal
TSIN_A_VALID	DI	TS input port A date valid signal
TSIN_B_DIN0	DI	Serial/Parallel TS input port B data 0
TSIN_B_DIN1	DI	Parallel TS input port B data 1
TSIN_B_DIN2	DI	Parallel TS input port B data 2
TSIN_B_DIN3	DI	Parallel TS input port B data 3
TSIN_B_DIN4	DI	Parallel TS input port B data 4
TSIN_B_DIN5	DI	Parallel TS input port B data 5
TSIN_B_DIN6	DI	Parallel TS input port B data 6
TSIN_B_DIN7	DI	Parallel TS input port B data 7
TSIN_B_FAIL	DI	TS input port B fail signal
TSIN_B_CLK	DI	TS input port B clock
TSIN_B_SOP	DI	TS input port B start of stream signal
TSIN_B_VALID	DI	TS input port B date valid signal

Table 3-19. PWM Interface Signal Description

Signal Name	Type	Description
PWM_A	DO	PWM channel A output signal
PWM_B	DO	PWM channel B output signal
PWM_C	DO	PWM channel C output signal
PWM_D	DO	PWM channel D output signal
PWM_E	DO	PWM channel E output signal
PWM_F	DO	PWM channel F output signal
PWMAO_A / PWMAO_A_HIZ	DO	PWM A output signal in Always On domain, or extended HiZ function of PWMAO_A
PWMAO_B	DO	PWM B output signal in Always On domain
PWMAO_C / PWMAO_C_HIZ	DO	PWM C output signal in Always On domain, or extended HiZ function of PWMAO_C
PWMAO_D	DO	PWM D output signal in Always On domain

**Table 3-20. I2C Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
I2C_AO_M0_SCL	DO	I2C bus port 0 clock output, Master mode, in AO domain
I2C_AO_M0_SDA	DIO	I2C bus port 0 data input/output, Master mode, in AO domain
I2C_AO_S0_SCL	DI	I2C bus port 0 clock input, Slave mode, in AO domain
I2C_AO_S0_SDA	DIO	I2C bus port 0 data input/output, Slave mode, in AO domain
I2C_EE_M0_SCL	DO	I2C bus port 0 clock output, Master mode, in EE domain
I2C_EE_M0_SDA	DIO	I2C bus port 0 data input/output, Master mode, in EE domain
I2C_EE_M1_SCL	DO	I2C bus port 1 clock output, Master mode, in EE domain
I2C_EE_M1_SDA	DIO	I2C bus port 1 data input/output, Master mode, in EE domain
I2C_EE_M2_SCL	DO	I2C bus port 2 clock output, Master mode, in EE domain
I2C_EE_M2_SDA	DIO	I2C bus port 2 data input/output, Master mode, in EE domain
I2C_EE_M3_SCL	DO	I2C bus port 3 clock output, Master mode, in EE domain
I2C_EE_M3_SDA	DIO	I2C bus port 3 data input/output, Master mode, in EE domain

**Table 3-21. eMMC Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
EMMC_D0	DIO	eMMC/NAND data bus bit 0 signal
EMMC_D1	DIO	eMMC/NAND data bus bit 1 signal
EMMC_D2	DIO	eMMC/NAND data bus bit 2 signal
EMMC_D3	DIO	eMMC/NAND data bus bit 3 signal
EMMC_D4	DIO	eMMC/NAND data bus bit 4 signal
EMMC_D5	DIO	eMMC/NAND data bus bit 5 signal
EMMC_D6	DIO	eMMC/NAND data bus bit 6 signal
EMMC_D7	DIO	eMMC/NAND data bus bit 7 signal
EMMC_CLK	DO	eMMC clock signal
EMMC_CMD	DIO	eMMC command signal

Signal Name	Type	Description
EMMC_NAND_DQS	DIO	eMMC/NAND data strobe

**Table 3-22. NAND Signal Description**

Signal Name	Type	Description
NAND_RB0	DI	NAND ready/busy
NAND_ALE	DO	NAND address latch enable
NAND_CE0	DO	NAND chip enable 0
NAND_CE1	DO	NAND chip enable 1
NAND_CLE	DO	NAND command latch enable
NAND_REN_WR	DO	NAND read enable or write/read
NAND_WEN_CLK	DO	NAND write enable or clock

**Table 3-23. NOR Interface Signal Description**

Signal Name	Type	Description
NOR_CS	DO	SPI NOR chip select
NOR_C	DO	SPI NOR Serial Clock
NOR_D	DIO	SPI NOR 1bit mode Output, 2/4 bit mode data I/O 0
NOR_Q	DIO	SPI NOR 1bit mode Input, 2/4 bit mode data I/O 1
NOR_WP	DIO	SPI NOR Write protection output, 4 bit mode data I/O 2
NOR_HOLD	DIO	SPI bus hold output, 4 bit mode data I/O 3

**Table 3-24. HDMI Interface Signal Description**

Signal Name	Type	Description
HDMITX_SDA	DIO	HDMI TX DDC_I2C interface data signal
HDMITX_SCL	DO	HDMI TX DDC_I2C interface clock signal
HDMITX_HPD_IN	DI	HDMI TX hot-plug in signal input
AO_CEC_A	DIO	Customer Electronics Control signal in AO domain
AO_CEC_B	DIO	2nd pin of Customer Electronics Control signal in AO domain

**Table 3-25. SPDIF Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
SPDIF_IN	DI	SPDIF input signal
SPDIF_OUT	DO	SPDIF output signal

**Table 3-26. PCIE Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
PCIECK_REQN	DI	PCIE clock request input

**Table 3-27. SPI Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
SPI_A_MOSI	DIO	SPI master output, slave input A
SPI_A_MISO	DIO	SPI master input, slave output A
SPI_A_SCLK	DIO	SPI clock A
SPI_A_SS0	DIO	SPI slave select 0 A
SPI_B_MOSI	DIO	SPI master output, slave input B
SPI_B_MISO	DIO	SPI master input, slave output B
SPI_B_SCLK	DIO	SPI clock B
SPI_B_SS0	DIO	SPI slave select 0 B

**Table 3-28. Remote Interface Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
IR_REMOTE_IN	DI	IR remote control input
IR_REMOTE_OUT	DO	IR remote control output

**Table 3-29. Time Division Multiplexing Signal Description**

<b>Signal Name</b>	<b>Type</b>	<b>Description</b>
MCLK_0	DO	Master clock output 0, for I2S master mode
MCLK_1	DO	Master clock output 1, for I2S master mode
TDMA_DIN0	DI	Data input 0 of TDM port A

Signal Name	Type	Description
TDMA_DIN1	DI	Data input 1 of TDM port A
TDMA_D0	DIO	Data input/output 0 of TDM port A
TDMA_D1	DIO	Data input/output 1 of TDM port A
TDMA_SCLK	DO	Bit clock output of TDM port A
TDMA_FS	DO	Frame sync output of TDM port A (Word clock of I2S)
TDMA_SLV_SCLK	DI	Bit clock input of TDM port A
TDMA_SLV_FS	DI	Frame sync input of TDM port A (Word clock of I2S)
TDMB_DIN0	DI	Data input 0 of TDM port B
TDMB_DIN1	DI	Data input 1 of TDM port B
TDMB_DIN2	DI	Data input 2 of TDM port B
TDMB_DIN3	DI	Data input 3 of TDM port B
TDMB_D0	DIO	Data input/output 0 of TDM port B
TDMB_D1	DIO	Data input/output 1 of TDM port B
TDMB_D2	DIO	Data input/output 2 of TDM port B
TDMB_D3	DIO	Data input/output 3 of TDM port B
TDMB_SCLK	DO	Bit clock output of TDM port B
TDMB_FS	DO	Frame sync output of TDM port B (Word clock of I2S)
TDMB_SLV_SCLK	DI	Bit clock input of TDM port B
TDMB_SLV_FS	DI	Frame sync input of TDM port B (Word clock of I2S)
TDMC_DIN0	DI	Data input 0 of TDM port C
TDMC_DIN1	DI	Data input 1 of TDM port C
TDMC_DIN2	DI	Data input 2 of TDM port C
TDMC_DIN3	DI	Data input 3 of TDM port C
TDMC_D0	DIO	Data input/output 0 of TDM port C
TDMC_D1	DIO	Data input/output 1 of TDM port C
TDMC_D2	DIO	Data input/output 2 of TDM port C
TDMC_D3	DIO	Data input/output 3 of TDM port C
TDMC_SCLK	DO	Bit clock output of TDM port C
TDMC_FS	DO	Frame sync output of TDM port C (Word clock of I2S)

Signal Name	Type	Description
TDMC_SLV_SCLK	DI	Bit clock input of TDM port C
TDMC_SLV_FS	DI	Frame sync input of TDM port C (Word clock of I2S)

**Table 3-30. PDM Signal Description**

Signal Name	Type	Description
PDM_DIN0	DI	PDM input data 0 signal
PDM_DIN1	DI	PDM input data 1 signal
PDM_DIN2	DI	PDM input data 2 signal
PDM_DIN3	DI	PDM input data 3 signal
PDM_DCLK	DO	PDM output clock signal

**Table 3-31. JTAG Interface Signal Description**

Signal Name	Type	Description
JTAG_A_TDO	DO	JTAG data output channel A
JTAG_A_TDI	DI	JTAG data input channel A
JTAG_A_TMS	DI	JTAG Test mode select input channel A
JTAG_A_CLK	DI	JTAG Test clock input channel A
JTAG_B_TDO	DO	JTAG data output channel B
JTAG_B_TDI	DI	JTAG data input channel B
JTAG_B_TMS	DI	JTAG Test mode select input channel B
JTAG_B_CLK	DI	JTAG Test clock input channel B

**Table 3-32. BT656 Interface Signal Description**

Signal Name	Type	Description
BT656_A_DIN0	DI	BT656 input data bus bit 0
BT656_A_DIN1	DI	BT656 input data bus bit 1
BT656_A_DIN2	DI	BT656 input data bus bit 2
BT656_A_DIN3	DI	BT656 input data bus bit 3
BT656_A_DIN4	DI	BT656 input data bus bit 4
BT656_A_DIN5	DI	BT656 input data bus bit 5

BT656_A_DIN6	DI	BT656 input data bus bit 6
BT656_A_DIN7	DI	BT656 input data bus bit 7
BT656_A_CLK	DI	BT656 input Clock
BT656_A_HS	DI	BT656 input HSYNC Signal
BT656_A_VS	DI	BT656 input VSYNC Signal

**Table 3-33. Ethernet Interface Signal Description**

Signal Name	Type	Description
ETH_LINK_LED	DO	Ethernet link LED indicator
ETH_ACT_LED	DO	Ethernet active LED indicator
ETH_RGMII_RX_CLK	DI	Ethernet RGMII interface receive clock input
ETH_RGMII_TX_CLK	DO	Ethernet RGMII transmit clock
ETH_TX_EN	DO	Ethernet RMII/RGMII Interface transmit enable
ETH_TXD3	DO	Ethernet RGMII interface transmit data 3
ETH_TXD2	DO	Ethernet RGMII interface transmit data 2
ETH_TXD1	DO	Ethernet RMII/RGMII interface transmit data 1
ETH_TXD0	DO	Ethernet RMII/RGMII interface transmit data 0
ETH_RX_DV	DI	Ethernet RMII/RGMII interface receive data valid signal
ETH_RXD3	DI	Ethernet RGMII interface receive data 3
ETH_RXD2	DI	Ethernet RGMII interface receive data 2
ETH_RXD1	DI	Ethernet RMII/RGMII interface receive data 1
ETH_RXD0	DI	Ethernet RMII/RGMII interface receive data 0
ETH_MDIO	DIO	Ethernet SMI interface management data input/output
ETH_MDC	DO	Ethernet SMI interface management clock

**Table 3-34. Other Signal Description**

Signal Name	Type	Description
WORLD_SYNC	DI	World clock sync input, to sync clock of multi devices
GEN_CLK_EE	DO	General clock output for EE domain clock, for debug
GEN_CLK_AO	DO	General clock output for AO domain clock, for debug

Confidential for Version!

## 4. Electrical Characteristics

### 4.1 Absolute Maximum Ratings

The table below gives the absolute maximum ratings. Exposure to stresses beyond those listed in this table may result in permanent device damage, unreliability or both.

Characteristic	Value	Unit
VDDCPU_A/B Supply Voltage	1.1	V
VDD_EE Supply Voltage	1.0	V
VDDQ Supply Voltage	1.7	V
AVDD_DDRPLL	1.98	V
1.8V Supply Voltage	1.98	V
3.3V Supply Voltage	3.63	V
Input voltage, V <sub>I</sub>	-0.3 ~ VDDIO+0.3	V
Junction Temperature	125	°C

### 4.2 Recommended Operating Conditions

Note:

All voltage specs listed in this part are applicable at the pins of the chip, not the output of the DC-DC.

Symbol	Parameter	Min.	Typ.	Max.	Unit
VDDCPU_A/B	Voltage for Cortex A73/A53 CPU	0.68 <sup>1</sup>	-	1.03 <sup>2</sup>	V
VDD_EE and other 0.8V domain	Voltage for GPU & core logic	0.77	0.8	0.9 <sup>2</sup>	V
VDDQ	DDR3/DDR3L/DDR4/LPDDR/LPDDR3/LPDDR4 IO Supply Voltage	1.05	-	1.6	V
AVDD18	1.8V AVDD for HDMI, USB, SARADC, PCIE, CVBS, AUDIO, MIPI_DSI, MIPI_CSI and ETHERNET phy.	1.71	1.80	1.89	V
VDD18_AO_XTAL	1.8V VDD for XTAL, and IOVREF	1.71	1.80	1.89	V
AVDD_DDRPLL	Analog power supply for DDRPLL module	1.05	-	1.89	V
AVDD33	3.3V AVDD for USB	3.15	3.3	3.45	V
VDDIO	LV mode	1.71	1.80	1.89	V
	HV mode	3.0 <sup>3</sup>	3.3	3.45	V
T <sub>J</sub>	Operating Junction Temperature	0	-	105 <sup>4</sup>	°C
T <sub>A</sub>	Operating Ambient Temperature	0	-	70	°C

Note:

- 1) Minimal VDDCPU\_A/B voltage is for sleep mode while system runs at very low speed. Higher clock will need higher voltage. Considering the power supply may have 3% deviation, the minimal voltage in actual application should not be set to lower than min spec plus 0.02V.
- 2) Likewise, maximum VDDCPU\_A/B voltage in actual application should not be higher than max spec minus 0.03V. Voltage of VDDCPU\_A/B will affect CPU speed. Use lower voltage when CPU runs on lower speed to save power. Recommend to use +/-1.5% or higher precision DCDC.
- 3) GPIO cannot work if VDDIO voltage is out of the spec of LV / HV mode. GPIO output at HV mode will be weaker & max operating speed will be lower if VDDIO are design to 3.0V. Do not design VDDIO to lower than 3.0V in HV mode, recommend to use +/-1.5% or higher precision DCDC to supply power for VDDIO, actual voltage supplies to VDDIO (HV mode) should not be lower than 2.9V.
- 4) For operating temperature, good heat sink may be needed to guarantee  $T_j < \text{max spec}$ .

### 4.3 Ripple Voltage Specification

Power	Max Ripple	Unit	Test state
VDDCPU_A	40	+/-mV	Run APK Stability Test
VDDCPU_B	40	+/-mV	Run APK Stability Test
VDD_EE and other 0.8V domain	40	+/-mV	Run APK Basemark ES 2.0 Taiji
DDR3 VDDQ and AVDD_DDRPLL	60	+/-mV	Kernel boot
DDR3L VDDQ and AVDD_DDRPLL	60	+/-mV	Kernel boot
LPDDR3 VDDQ and AVDD_DDRPLL	40	+/-mV	Kernel boot
DDR4 VDDQ and AVDD_DDRPLL	40	+/-mV	Kernel boot
LPDDR4 VDDQ and AVDD_DDRPLL	40	+/-mV	Kernel boot
AVDD18	30	+/-mV	Kernel boot
VDD18_AO_XTAL	30	+/-mV	Kernel boot
AVDD33	50	+/-mV	WIFI SCAN
VDDIO LV	60	+/-mV	Kernel boot
VDDIO HV	60	+/-mV	WIFI SCAN

**Note:**

Ripple specification is only a reference spec, customer should run stress/performance/reliability test ( high/low temperature test , damp and hot test , function test , etc... ) on their product to confirm the system stability

## 4.4 Thermal Resistance

Jedec 2P2S board 101.5mm\*114.5mm, natural convection, ambient temperature 25°C.

Symbol	Parameter	Value (°C/Watt)	Air Flow (m/s)
$\Theta_{ja}$	Package junction-to-ambiance thermal resistance in nature convection	15.0521	0
$\Theta_{jb}$	Package junction-to-pcb thermal resistance in nature convection	6.26571	0
$\Theta_{jc}$	Package junction-to-case thermal resistance in nature convection	5.57433	0

Note:

- 1.) Due to the thinness of the SOC, DRAM or capacitors placed close to SOC may prevent heatsink touching SOC top side. A special convex shape heatsink is recommended.
- 2.) These measurement were conducted on a JEDEC defined 2S2P system. For more information, check below JEDEC standards:
  - JESD51-2A: Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)
  - JESD51-8: Integrated Circuit Thermal Test Method Environmental Conditions — Junction-to-Board
  - JESD51-12: Guidelines for Reporting and Using Electronic Package Thermal Information
- 3.) m/s = meters per second

## 4.5 DC Electrical Characteristics

### 4.5.1 Normal GPIO Specifications (For DIO)

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{iH(VDDIO=3.3V)}^3$	High-level input voltage	IOVREF+0.37	-	VDDIO+0.3	V
$V_{iL(VDDIO=3.3V)}^3$	Low-level input voltage	-0.3	-	IOVREF-0.23	V
$V_{iH(VDDIO=1.8V)}^3$	High-level input voltage	IOVREF/2+0.3	-	VDDIO+0.3	V
$V_{iL(VDDIO=1.8V)}^3$	Low-level input voltage	-0.3	-	IOVREF/2-0.3	V
$R_{PU}$	Built-in pull up resistor	50K	60K	70K	ohm
$R_{PD}$	Built-in pull down resistor	50K <sup>5</sup>	60K	130K <sup>6</sup>	ohm
$IoL/IoH(DS=0)^{1,4}$	GPIO driving capability	0.5	-	-	mA
$IoL/IoH(DS=1)^1$	GPIO driving capability	2.5	-	-	mA
$IoL/IoH(DS=2)^1$	GPIO driving capability	3	-	-	mA
$IoL/IoH(DS=3)^1$	GPIO driving capability	4 <sup>2</sup>	-	-	mA
$VOH$	Output high level with $IoL/IoH$ loading	VDDIO-0.5	-	-	V
$VOL$	Output low level with $IoL/IoH$ loading	-	-	0.4	V

Note:

1. With Minimal  $IoL/IoH$  driving capability loading, IO is guaranteed to meet  $Vol < 0.4V$  or  $VOH > (VDDIO-0.5V)$  spec.
2. Maximal GPIO loading is 6mA for application such as driving LED, which does not care about  $Vol/Voh$  spec. Please set DS=3 for such application.

3. VDD18\_AO supplies power to IOVREF.
4. Do not use this setting, it's too weak for most applications.
5. Test condition, GPIO pin voltage close to 0 V.
6. Test condition, GPIO pin voltage close to VDDIO(3.3 V).

#### 4.5.2 Open Drain GPIO Specifications (For DIO\_OD)

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>iH(OD5V)</sub>	High-level input voltage	1.5		5.5	V
V <sub>iL(OD5V)</sub>	Low-level input voltage	-0.3		0.8	V
V <sub>iH(OD3.3V)</sub>	High-level input voltage	1.5		3.6	V
V <sub>iL(OD3.3V)</sub>	Low-level input voltage	-0.3		0.8	V
R <sub>PU/PD</sub>	No built-in pull up/down resistor on OD IO	-	-	-	ohm
I <sub>o</sub>	OD IO driving low capability	4		6	mA
V <sub>OL</sub>	Output low level with min I <sub>o</sub> loading			0.4	V

Note:

1. With Minimal I<sub>oL</sub> driving capability loading, IO is guaranteed to meet V<sub>OL</sub><0.4V spec
2. Maximal GPIO loading is 6mA for application such as driving LED, which does not care about V<sub>OL</sub> spec.
3. The V<sub>iL</sub>/V<sub>iH</sub> of OD PAD is irrelevant to VDDIO voltage

#### 4.5.3 DDR3/DDR3L/DDR4/LPDDR3/LPDDR4 SDRAM Specifications

##### Recommended Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
VDDQ	IO supply voltage(DDR3)	1.425	1.50	1.57	V
VDDQ	IO supply voltage(DDR3L)	1.283	1.35	1.45	V
VDDQ	IO supply voltage(DDR4)	1.14	1.20	1.30	V
VDDQ	IO supply voltage(LPDDR3)	1.14	1.2	1.30	V
VDDQ	IO supply voltage(LPDDR4)	1.06	1.1	1.17	V
V <sub>ref</sub>	Input reference supply voltage	0.49*VDDQ	0.5*VDDQ	0.51*VDDQ	V

Note: The minimal VDDQ voltage in sleep mode is defined by memory.

##### DC specifications - DDR3/DDR3L mode

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>IH</sub>	DC input voltage high	V <sub>ref</sub> + 0.100		VDDQ	V
V <sub>IL</sub>	DC input voltage low	V <sub>SSQ</sub>		V <sub>ref</sub> -0.100	V
V <sub>OH</sub>	DC output logic high	0.8*VDDQ			V
V <sub>OL</sub>	DC output logic low			0.2*VDDQ	V
RTT	Input termination resistance to VDDQ/2	100 54 36	120 60 40	140 66 44	ohm

**DC specifications – DDR4 mode**

Symbol	Parameter	Min.	Typ.	Max.	Unit
VdLVW_total	Rx Mask voltage-p-p total			136	mv
VOH	DC output logic high	0.9*VDDQ			V
VOL	DC output logic low			0.1*VDDQ	V
RTT	Input termination resistance to VDDQ	200	240	280	ohm
		100	120	140	
		67	80	93	
		50	60	70	
		42	48	56	
		34	40	46	
		28	34	40	

**DC Specifications – LPDDR3 mode**

Symbol	Parameter	Min.	Typ.	Max.	Unit
VIH	DC input voltage high	Vref + 0.100		VDDQ	V
VIL	DC input voltage low	VSSQ		Vref-0.100	V
VOH	DC output logic high	0.9*VDDQ			V
VOL	DC output logic low			0.1*VDDQ	V
RTT	Input termination resistance to VDDQ	100 200	120 240	140 280	ohm

**DC Specifications – LPDDR4 mode**

Symbol	Parameter	Min.	Typ.	Max.	Unit
VOH	DC output logic high	0.9*VDDQ	-	-	V
VOL	DC output logic low	-	-	0.1*VDDQ	V
RTT	Input termination resistance to VDDQ	216	240	264	ohm
		108	120	132	
		72	80	88	
		54	60	66	
		43.2	48	52.8	
		36	40	44	

**4.6 Recommended Oscillator Electrical Characteristics**

A311D requires the 24MHz oscillator for generating the main clock source.

**Table 4-1. 24MHz Oscillator Specification**

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
$F_o$	Nominal Frequency		24		MHz	
$\Delta f/f_o$	Frequency Tolerance	-30		+30	ppm	At 25 °C
		-50		+50	ppm	At -20~85 °C
$C_L$	Load Capacitance	7.5	12	12.5	pF	
ESR	Equivalent Series Resistance			100	oHm	

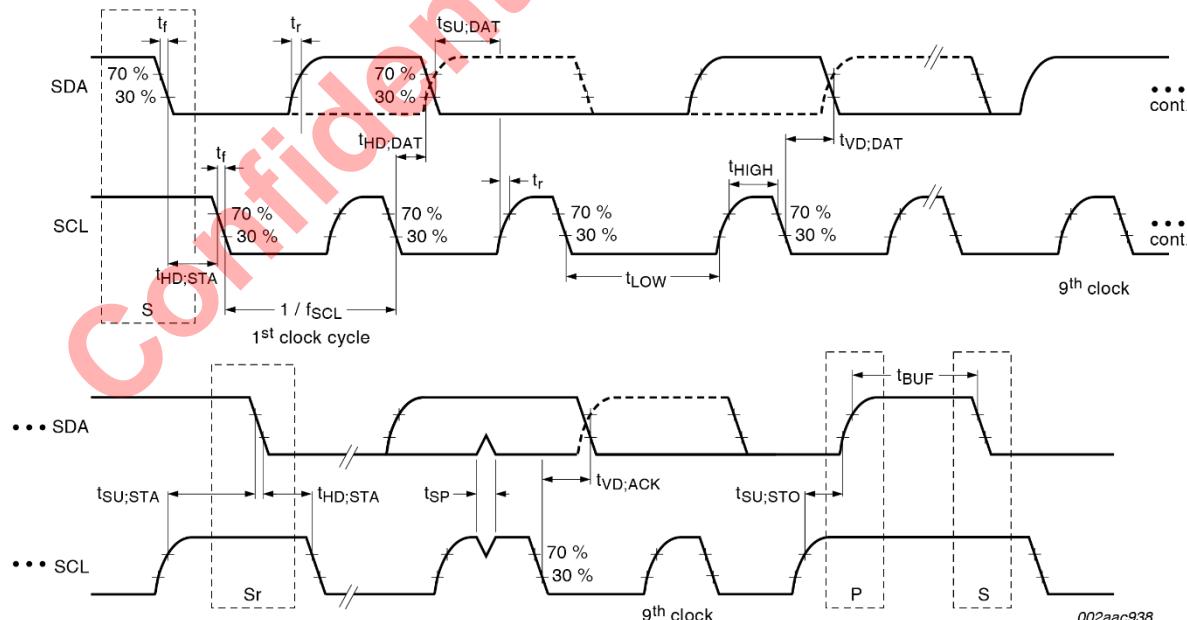

Note:

- 10ppm Tolerance is preferred if 24MHz XTAL is also driving WIFI module.
- For user external clock source, Please connect input clock output to SYS\_OSCIN , let SYS\_OSCOUT floating.
- The threshold of Xin inverter is around 0.9V (Xin range: -0.3V to +2.1V). Therefore, Following suggestion for input clock.
  - Suggestion 1: Without DC blocking capacitor, use a higher Vpp output TCXO. The high voltage should be higher than 1.35V (VSWING >1.35V, 0V to >1.35V).
  - Suggestion 2: With DC blocking capacitor, re-bias the middle voltage at 0.9V, VSWING >2\*0.45V;

## 4.7 Timing Information

### 4.7.1 I2C Timing Specification

The I2C master interface Fast/Standard mode timing specifications are shown below.

**Figure 4-1. I2C Interface Timing Diagram, FS mode**

$$V_{IL} = 0.3V_{DD}$$

$$V_{IH} = 0.7V_{DD}$$

**Table 4-2. I2C Interface Timing Specification, SF mode**

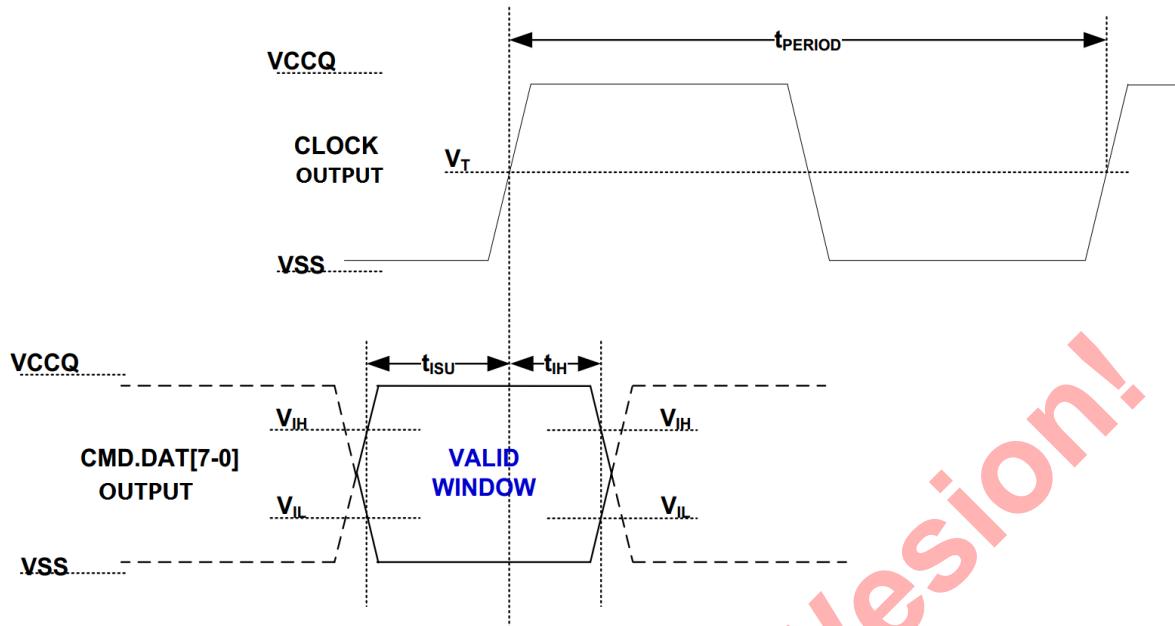

<b>Symbol</b>	<b>Parameter</b>	<b>Standard-mode</b>		<b>Fast-mode</b>		<b>Unit</b>
		<b>Min.</b>	<b>Max</b>	<b>Min</b>	<b>Max</b>	
tR	Rise time of SDA and SCL signals	-	1000	-	300	ns
tF	Fall time of SDA and SCL signals	-	300	-	300	ns
fSCL	SCL clock frequency	-	100	-	400	KHz
tLOW	LOW period of the SCL clock	4.7	-	1.3	-	μs
tHIGH	HIGH period of the SCL clock	4.0	-	0.6	-	μs
tSu;STA	Setup time for START	4.7	-	0.6	-	μs
tSu;DAT	Setup time for SDA	250	-	100	-	ns
tSu;STO	Setup time for STOP	4.0	-	0.6	-	μs
tHd;STA	Hold time for START	4.0	-	0.6	-	μs
tHd;DAT	Hold time for SDA	0	3.45	0	0.9	μs
tBuf	Bus free time between stop and start	4.7	-	1.3	-	μs

Note:

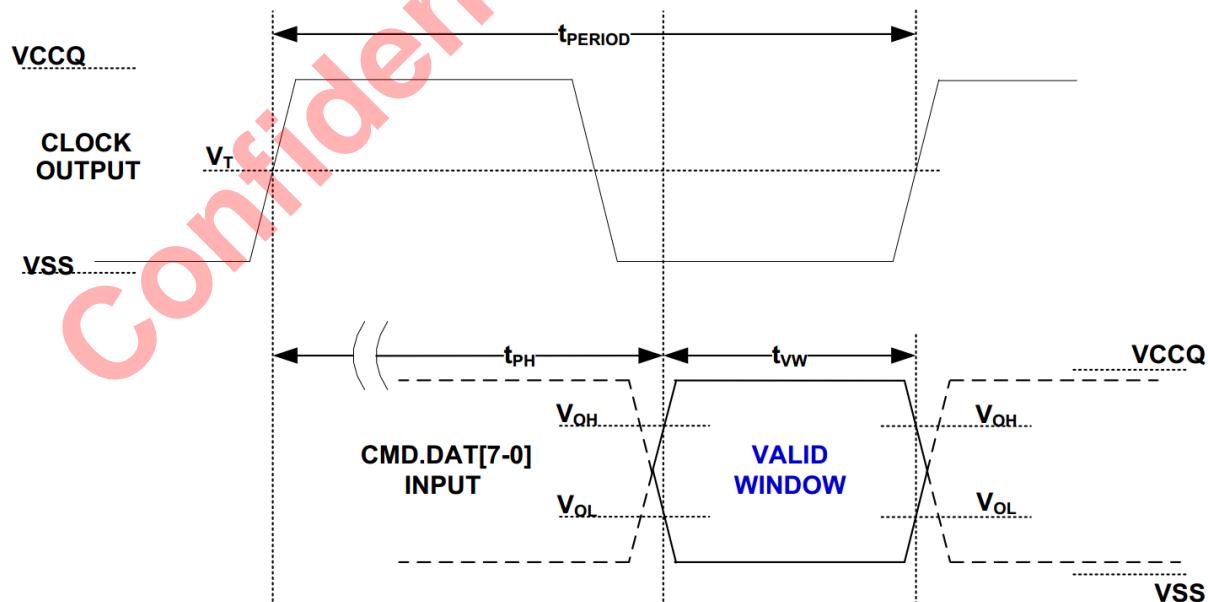

Driving strength of OD pin is not adjustable.

#### 4.7.2 EMMC/SDIO Timing Specification

Timing specification for EMMC and SD are shown as below.

**Figure 4-2. EMMC HS200 Data Output Timing****Table 4-3 HS200 Timing Specification**

Symbol	Parameter	Min	Max	Unit
tPERIOD	Cycle time data transfer mode	5	-	ns
tISU	output set-up time	1.4	-	ns
tIH	output hold time	0.8	-	ns

**Figure 4-3. EMMC HS200 Data Input Timing****Table 4-4 HS200 Timing Specification**

Symbol	Parameter	Min	Max	Unit

tPH	Device output momentary phase from CLK input to CMD or DAT line output. Does not include a longterm temperature drift.	0	2	UI
$\Delta t_{PH}$	Delay variation due to temperature change after tuning. Total allowable shift of output valid window (TVW) from last system Tuning procedure $\Delta t_{PH}$ is 2600ps for $\Delta T$ from -25 °C to 125 °C during operation.	-350( $\Delta T = -20$ deg.C)	1550( $\Delta T = 90$ deg.C)	ps
tVW	Valid Data Simple window	0.575	-	UI

Figure 4-4. SDIO(SDR104) Clock Signal Timing Diagram

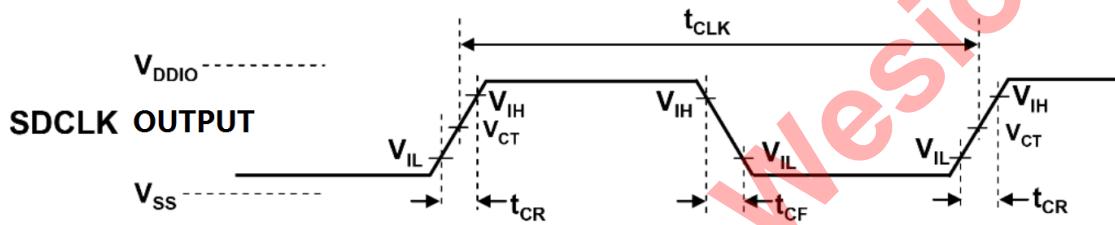

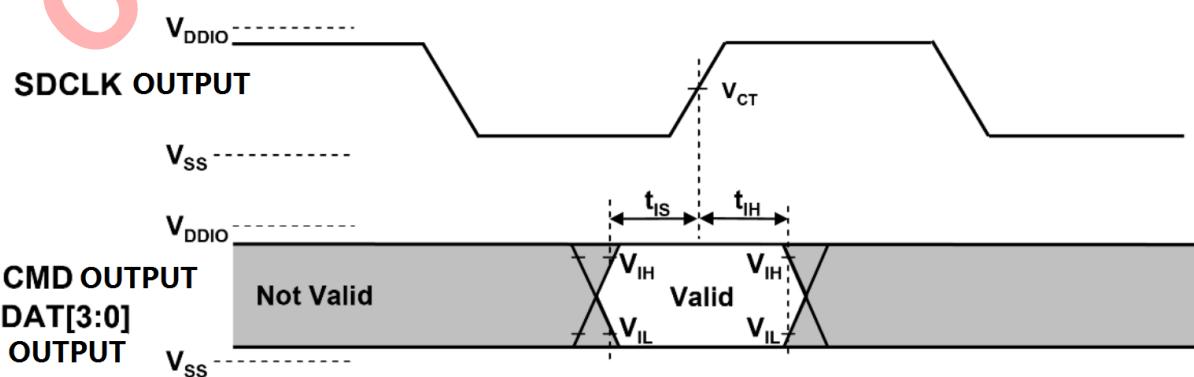

Table 4-5 SDIO(SDR104) Clock Timing Specification

Symbol	Parameter (SDR104 Mode)	Min	Max	Unit
tCLK	clock period Data Transfer Mode(PP)	4.8	-	ns
Duty	Clock Duty	30	70	%
tCR	clock rise time	-	0.96	ns
tCF	clock fall time	-	0.96	ns

Figure 4-5. SDIO(SDR104) Output Timing Diagram

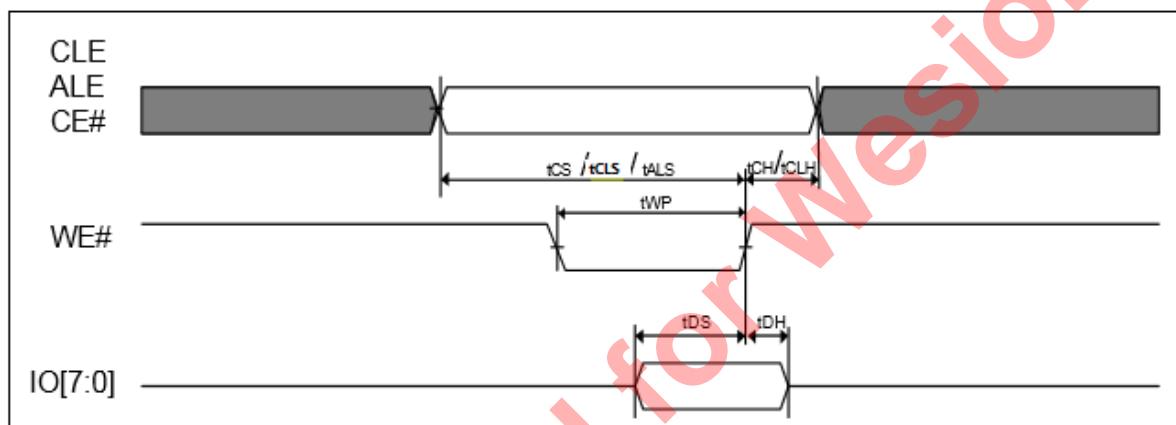

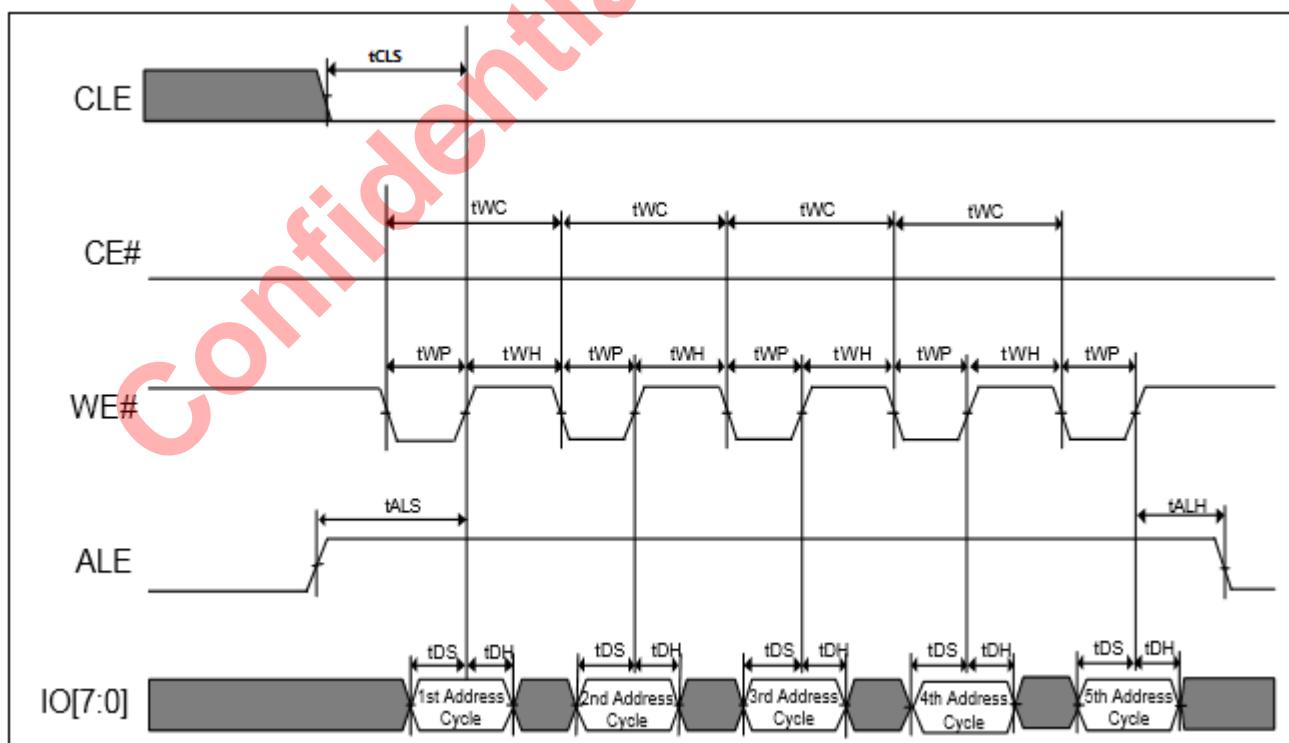

**Table 4-6 SDIO(SDR104) Timing Specification**

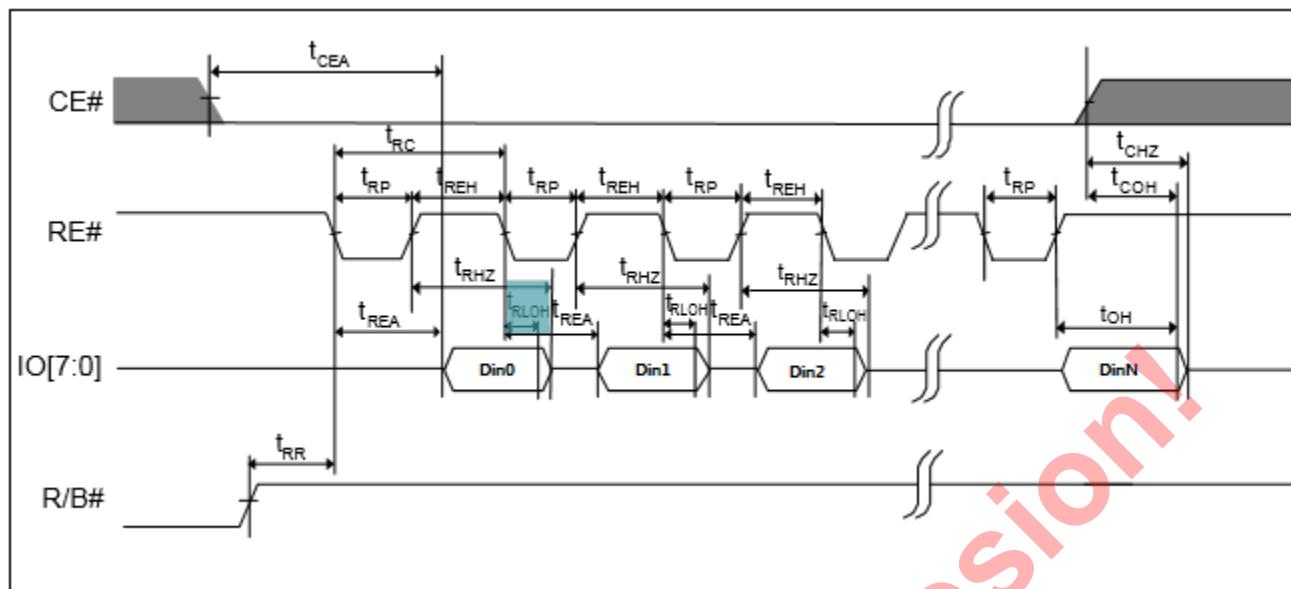

Inputs CMD, DAT (referenced to CLK)				
Symbol	Parameter	Min	Max	Unit
tIS	input set-up time	1.4	-	ns
tIH	input hold time	0.8	-	ns

Note:SD card interface uses SDIO protocol

### 4.7.3 NAND Timing Specification

Nand timing specifications are shown as below.

**Figure 4-6 Async Waveform for Command/Address/Data Output Timing****Figure 4-7 Async Waveform for Address Output Cycle**

**Figure 4-8 Async Waveform for Sequential Data Read Cycle(After Read)-EOD Mode****Table 4-7 Nand Timing Specifications**

Symbol	Parameter(Asynchronous) (mode 5)	Min	Max	Unit
tCLS	CLE setup time	10	-	ns
tCLH	CLE hold time	5	-	ns
tALS	ALE setup	10	-	ns
tALH	ALE hold	5	-	ns
tDS	Data setup time	7	-	ns
tDH	Data hold time	5	-	ns
tWC	WE# cycle time	20	-	ns
tWP	WE# pulse width	10	-	ns
tWH	WE# high hold time	7	-	ns
tREA	RE# access time	-	16	ns
tOH	Data output hold time	15	-	ns
tRLOH	RE#-low to data hold time (EDO)	5	-	ns
tRP	RE# pulse width	10	-	ns
tREH	RE# high hold time	7	-	ns
tRC	RE# cycle time	20	-	ns

#### 4.7.4 SPICC Timing Specification

Figure 4-9. SPICC Timing Diagram

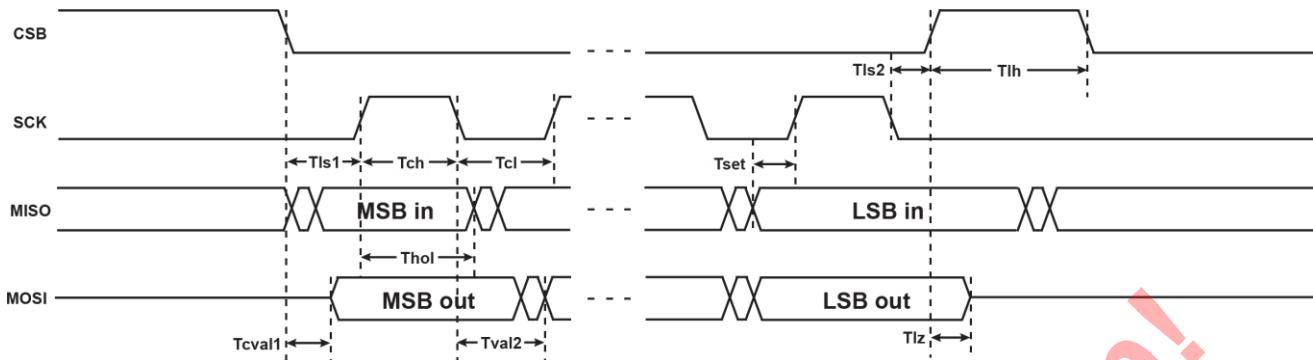

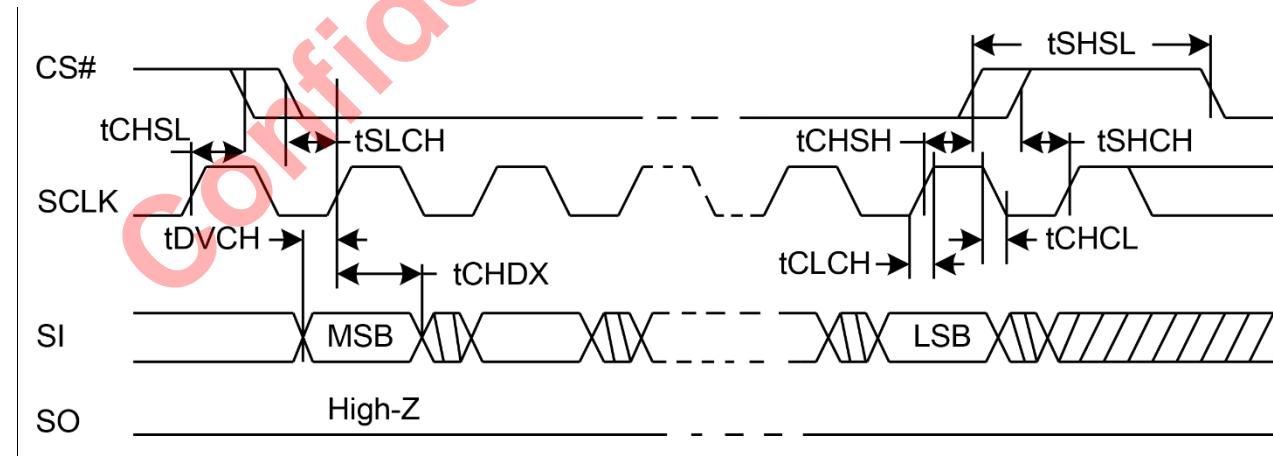

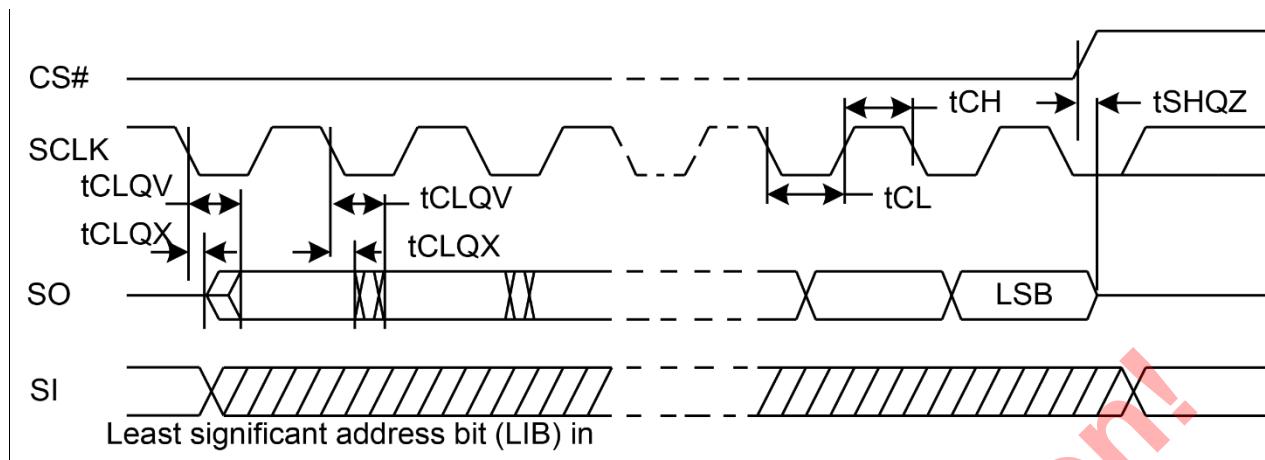

Table 4-8. SPICC Master Timing Specification

Symbol	Description	Min.	Max.	Unit
fCLK	Clock Frequency	1	80	MHz
TCH	Clock high time	5		ns
TCL	Clock low time	5		ns
TLS1	CS fall to First Rising CLK Edge	50		ns
TSET	Data input Setup Time	4		ns
THOL	Data input Hold Time	4		ns
TLH	Minimum idling time between transfers(minimum ss high time)	5		ns

#### 4.7.5 SPIFC Timing Specification

Figure 4-10. SPIFC Serial Input Timing Diagram

**Figure 4-11. SPIFC Out Timing Diagram****Table 4-9. SPIFC Master Timing Specification**

Symbol	Parameter(Clock 41.7MHz)	Min	Max	Unit
fRSCLK	Clock Frequency for READ instructions		50	Mhz
tCH	Clock High Time	8		ns
tCL	Clock Low Time	8		ns
tCLCH	Clock Rise Time (peak to peak)	0.1		V/ns
tCHCL	Clock Fall Time (peak to peak)	0.1		V/ns
tSLCH	CS# Active Setup Time (relative to SCLK)	4	-	ns
tCHSH	CS# Active Hold Time (relative to SCLK)	4	-	ns
tDVCH	Data In Setup Time	2	-	ns
tCHDX	Data In Hold Time	3	-	ns
tSHQZ	Output Disable Time (relative to CS#)		8	ns
tCLQV	Clock Low to Output Valid		6	ns
tCLQX	Output Hold Time	1		ns

#### 4.7.6 Ethernet Timing Specification

Figure 4-12. Management Data Timing Diagram

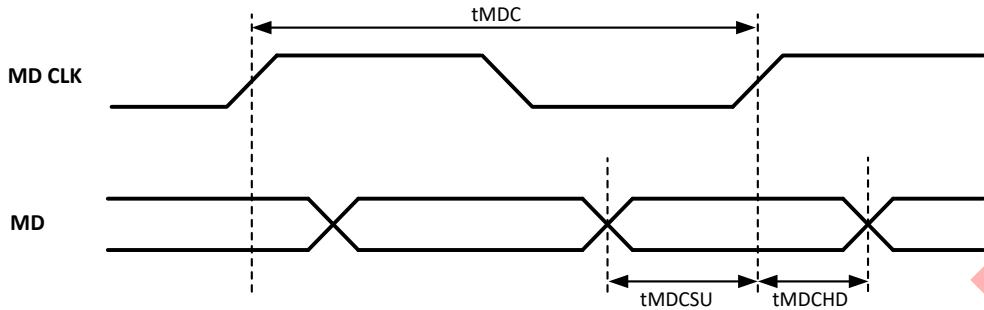

Table 4-10. Management Data Timing Specification

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
$t_{MDC}$	MDC clock Period	400	500		ns	From MAC
$t_{MDCSU}$	Setup time to rising edge of MDC	10			ns	
$t_{MDCHD}$	Hold time to rising edge of MDC	10			ns	

Figure 4-13. RMII Timing Diagram

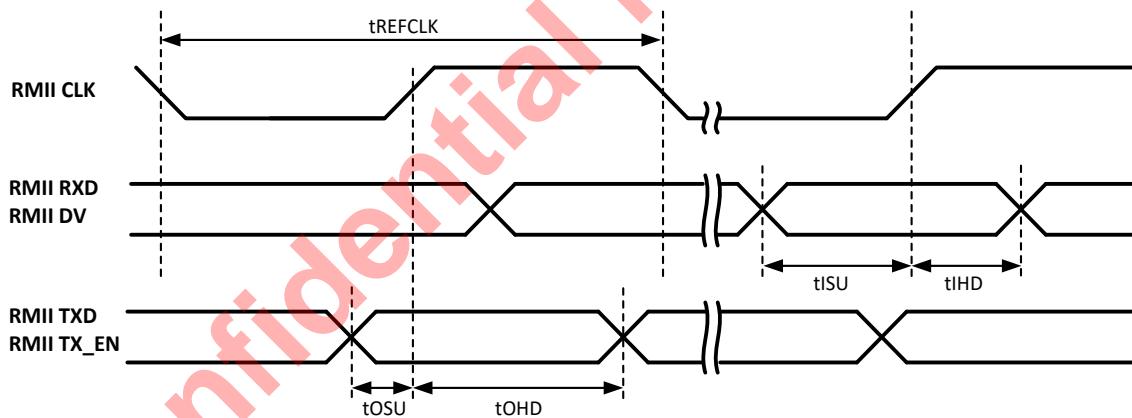

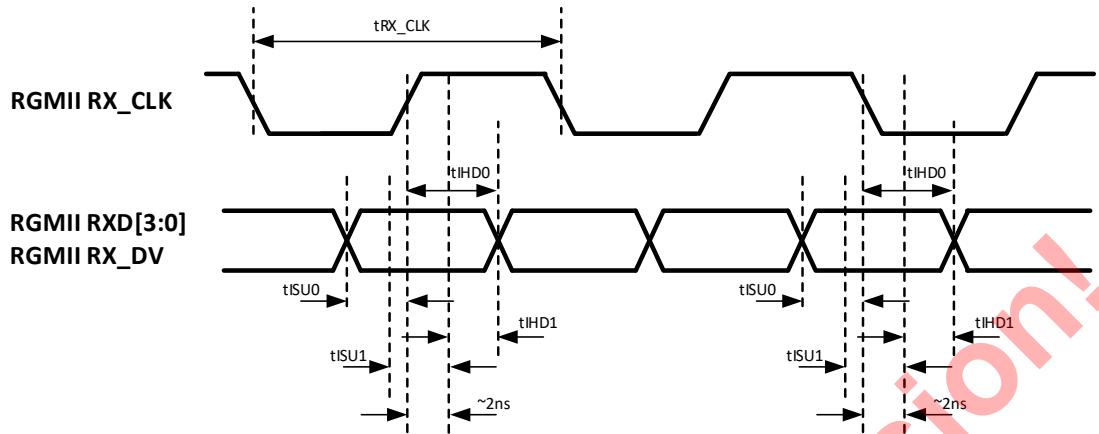

Table 4-11. RMII Timing Specification

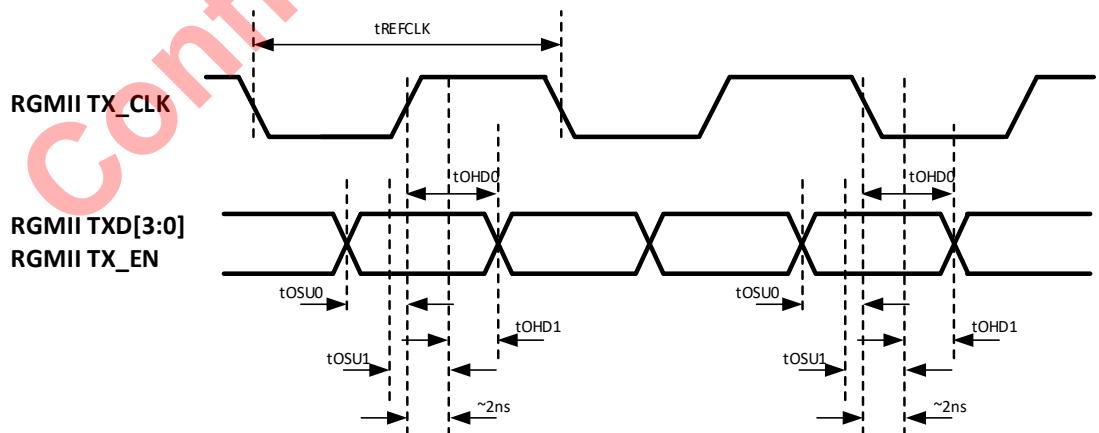

Symbol	Description	Min.	Typ.	Max	Unit	Notes
$t_{REFCLK}$	RMII clock period		20		ns	50MHz from PHY
$t_{OSU}$	TXD & TX_EN setup time to rising edge of RMII clock	1.8	10		ns	To PHY
$t_{OHD}$	TXD & TX_EN hold time to rising edge of RMII clock	1.4	10		ns	To PHY
$t_{ISU}$	RXD & DV setup time to rising edge of RMII clock	1.0	10		ns	From PHY
$t_{IHD}$	RXD & DV hold time to rising edge of RMII clock	1.0	10		ns	From PHY

**Figure 4-14. RGMII Receive Timing Diagram****Table 4-12. RGMII Receive Timing Specification**

Symbol	Description	Min.	Typ.	Max	Unit	Notes
tRX_CLK	RGMII RX_CLK clock period		8		ns	125MHz from PHY
tSETUP	RXD[3:0] & RX_DV setup time (PHY internal delay enabled)	1.2			ns	From PHY
tHOLD	RXD[3:0] & RX_DV hold time (PHY internal delay enabled)	1.2			ns	From PHY
tSKEW	RXD[3:0] & RX_DV skew between these 5 signals (PHY internal delay disabled)	-0.5		0.5	ns	From PHY

When PHY internal delay is enabled, check setup/hold timing.

When PHY internal delay is disabled, check signal skew.

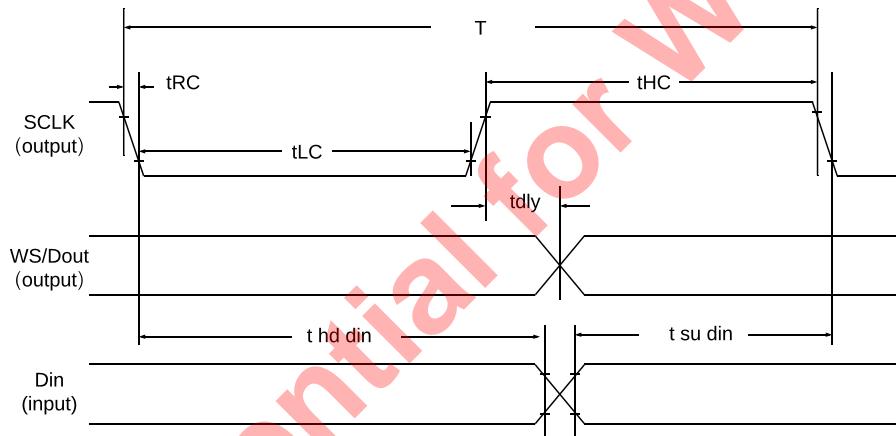

**Figure 4-15. RGMII Transmit Timing Diagram**

**Table 4-13. RGMII Transmit Timing Specification**

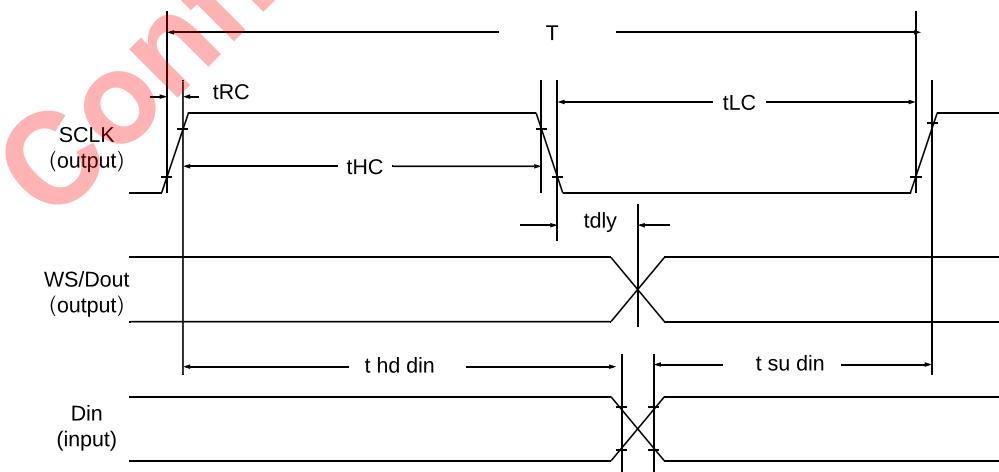

Symbol	Description	Min.	Typ.	Max	Unit	Notes
tTX_CLK	RGMII TX_CLK clock period		8		ns	125MHz to PHY
tOSU	TXD & TX_EN setup time to rising edge of RGMII clock (no clock delay added)	1			ns	From PHY
	TXD & TX_EN setup time to rising edge of RGMII clock (clock delay added)	-0.9			ns	From PHY
tOHD	RXD & DV hold time to rising edge of RGMII clock (no clock delay added)	0.8			ns	From PHY
	RXD & DV hold time to rising edge of RGMII clock (clock delay added)	2.7			ns	From PHY

#### 4.7.7 Audio Timing Specification

There are two modes for the audio I2S/TDM interface: Master mode and Slave mode, as shown below.

**Figure 4-16 Output Data of SCLK Rising Edge TDM/I2S Timing, Master Mode**

Note: Input data was sampled on SCLK rising/falling edge via software setting.

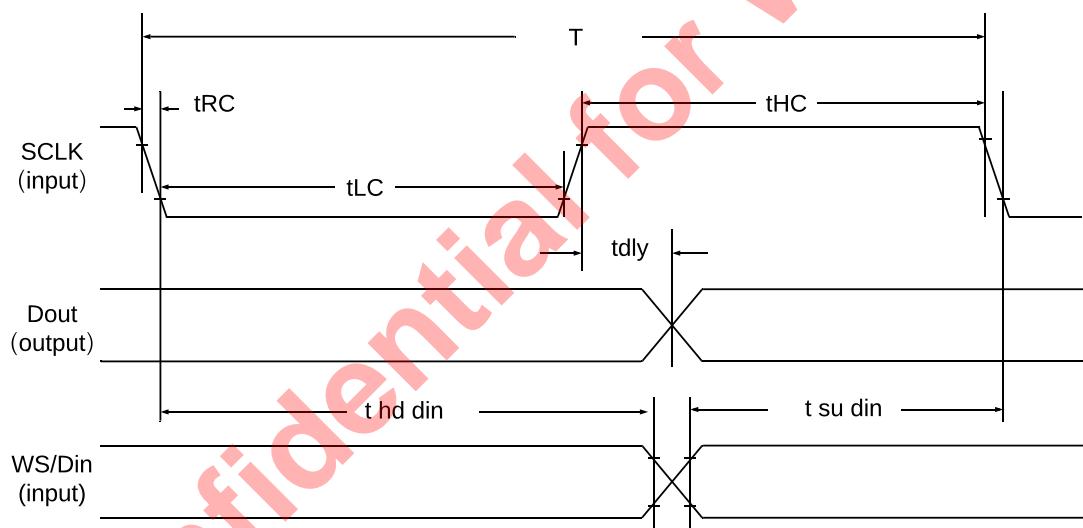

**Figure 4-17 Output Data of SCLK Falling Edge TDM/I2S Timing, Master Mode**

Note: Input data was sampled on SCLK rising/falling edge via software setting.

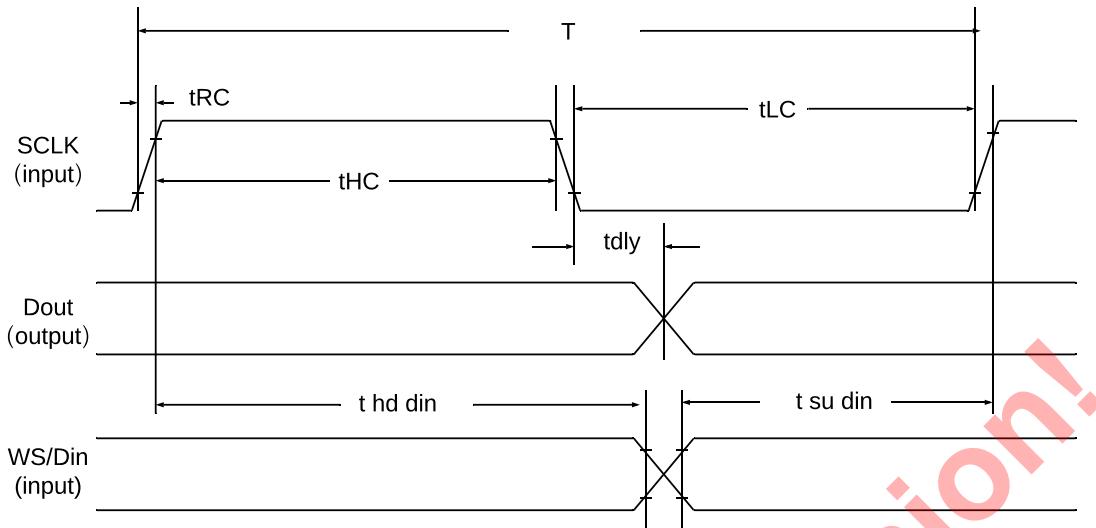

**Table 4-14 Audio I2S/TDM Timing Specification, Transmitter, Master Mode**

Transmitter (master mode)					
Symbol	Parameter	Min	Typ	Max	Unit
T	Clock period	10			ns
tHC	High level of SCLK	0.35			T
tLC	Low level of SCLK	0.35			T
tRC	Edge time of SCLK			0.15	T
tdly	Delay from SCLK to WS	-2	3	5	
Tsu din	Setup time of Din	4			ns
Thd din	Hold time of Din	4			ns

Note: Measure point refer to parameter Vih, Vil of Normal GPIO specifications.

**Figure 4-18 Output Data of SCLK Rising Edge TDM/I2S Timing, Slave Mode**

Note: Input data was sampled on SCLK rising/falling edge via software setting.

**Figure 4-19 Output Data of SCLK Falling Edge TDM/I2S Timing, Slave Mode**

Note: Input data was sampled on SCLK rising/falling edge via software setting.

**Table 4-15 Audio I2S/TDM Timing Specification, Transmitter, Slave Mode**

Transmitter (slave mode)					
Symbol	Parameter	Min	Typ	Max	unit
T(out)	Clock period	40			ns
T(in)	Clock period	10			ns
tHC	High level of SCLK	0.35			T
tLC	Low level of SCLK	0.35			T
tRC	Edge time of SCLK			0.15	T
tsu din	Setup time of WS/Din	4			ns
thd din	Hold time of WS/Din	4			ns
tdly	Delay between SCLK and Dout	2	12	15	ns

Note: Measure point refer to parameter Vih, Vil of Normal GPIO specifications.

#### 4.7.8 PDM Timing Specification

**Figure 4-20 PDM Timing Diagram**

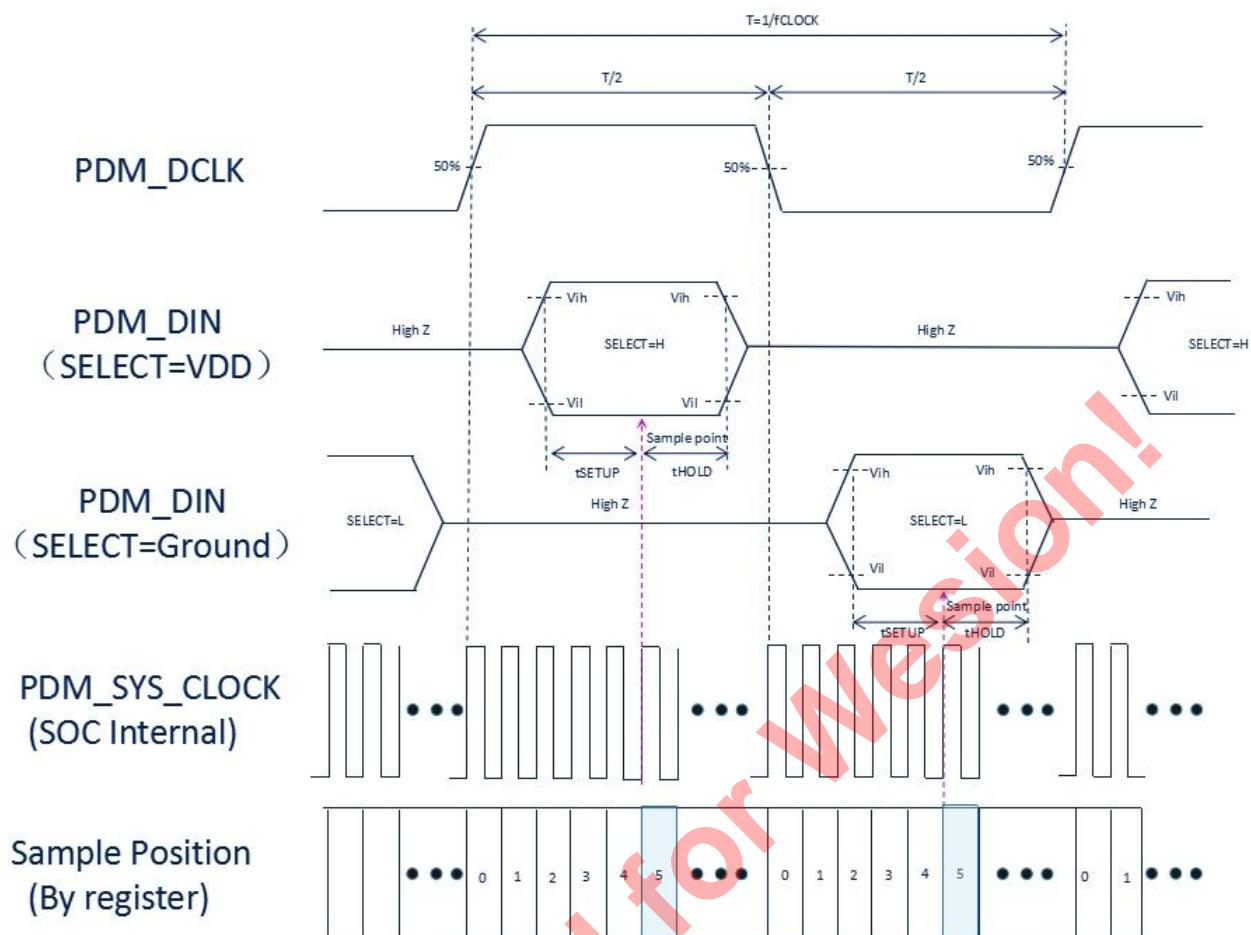

Table 4-16 PDM Timing Specification

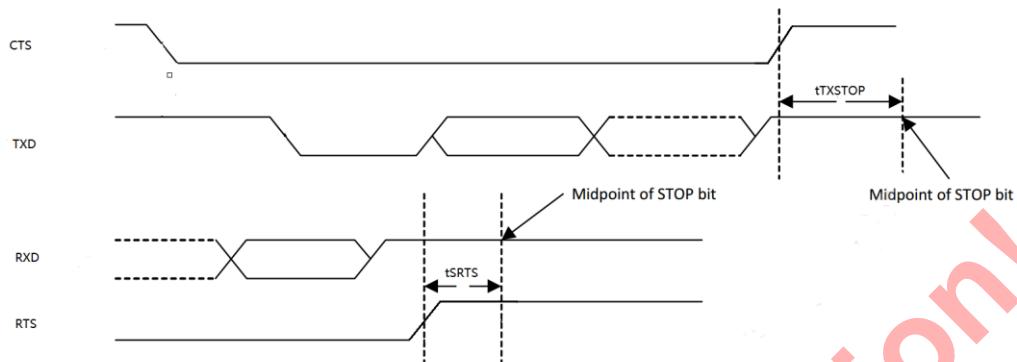

Parameter	Symbol	Min.	Typ.	Max.	Units.
PDM clock period	$t_{DCLK}$	200			ns
PDM clock duty cycle	$t_{HIGH}/t_{LOW}$	48%		52%	$t_{DCLK}$
PDM Data setup time	$t_{SETUP}$	20			ns
PDM Data hold time	$t_{HOLD}$	20			ns
Sys clock period	$t_{SYSCLK}$	5	7.5		ns

Note:

- 1.Default PDM\_SYS\_CLOCK=133MHz
- 2.For Sample position, please refer to PDM register PDM\_CHAN\_CTRL,PDM\_CHAN\_CTRL1

#### 4.7.9 UART Timing Specification

**Figure 4-21 Figure UART Timing Diagram**

**Table 4-17 UART Timing Specification**

Parameter	Symbol	Min.	Max.	Units.
Delay time ,CTS high before midpoint of stop bit	tTXSTOP	-	0.5	Bit Periods
Delay time ,midpoint of stop bit to RTS high	tSRTS	-	0.5	Bit Periods

## 4.8 Power Consumption

Note: Value listed here is estimated typical max value tested. Enough margin in circuit needs to be reserved.

Symbol	Maximum Current	Note
VDDCPU_A	6 A	-
VDDCPU_B	1.2A	
VDD_EE	4 A	-
VDD_DDR	400 mA	
VDDQ	600 mA	Note: Peak SOC + DRAM VDDQ current is up to 1.5A with 2 ranks DDR3.

Symbol	Typical current	Maximum current	Note
VDD18_AO_XTAL	1 mA	-	EFUSE: Max 100 mA when programing EFUSE.
VDDAO_0V8	22 mA	-	-
AVDD0V8_USB_PCIE	58 mA	-	
AVDD0V8_HDMI	23 mA	-	At 6 Gbps mode
AVDD_DDRPLL	6 mA	-	
AVDD18_ENET	40 mA	-	-
AVDD18_AUDIO	4 mA	6.6 mA	-
AVDD18_PCIE	45mA	-	At 5 Gbps mode
AVDD18_HDMI	3.3 mA	-	-
AVDD18_SARADC	1.2 mA		
AVDD18_CVBS		48 mA	
AVDD18_MIPIDSI	40 mA		
AVDD18_MIPICSI	40 mA	-	
AVDD18_USB	13.8 mA	17 mA	Per channel
AVDD33_USB	7 mA	-	Per channel
AVDD18_DPLL	35 mA	--	
VDDIO	-	-	Note

Note:

VDDIO=1.8V, DS=3, output 200MHz clock:

- 1) IO pad itself consumes about 1.4mA.
- 2) Driving a 55ohm trace with length of 50mm and width of 0.1mm will consumes about 2.8mA additional current (low impedance trace consumes more power)
- 3) Base #2, add 5pF cap will consumes about 1.8mA additional current, total about 6mA
- 4) When VDDIO=3.3V, GPIO consumes about 70% higher current, about 13mA
- 5) Internal & external pull down resistor consumes additional current

## 4.9 Storage and Baking Conditions

The processor is moisture-sensitive device of MSL level 3, defined by IPC/JEDEC J-STD-020. Please follow the storage and backing guidelines.

- 1) Calculated shelf life in sealed bag: 12 months at <40°C and <90% relative humidity (RH).
- 2) After bag is opened, devices that will be subjected to reflow solder or other high temperature process must be
  - a) Mounted with 168 hours of factory conditions ≤30°C/60% RH, or
  - b) Stored per J-STD-033
- 3) Devices require bake, before mounting, if Humidity Indicator Card reads >10%.
- 4) If baking is required, refer IPC/JEDEC J-STB-033 for baking process.

## 5. Power On Config

3 Boot pins are used as power on config (POC) pins, to set the booting sequence.

POC setting is latched at the rising edge of reset signal.

3 POC pins are all pull high internal, CPU will try to boot from nand/eMMC first, if fails than try to boot from SD CARD, still fails then try to boot from USB (PC).

External 4.7K ohm pull down resistors can be used to change the POC setting. The resistors should be placed on right location, avoid stubs on high speed signals.

A311D's Power On Configuration is listed as following:

**Table 5-1. Power On Configuration Pin Table**

POC	Boot Pin	Name	Pull low	Pull high
POC0	Boot [4]	SPI NAND First	SPI NAND boot first	Default sequence
POC1	Boot [5]	USB First	USB boot first	Default sequence
POC2	Boot [6]	SPI NOR First	SPI NOR first	Default sequence

**Booting Sequence Diagram**

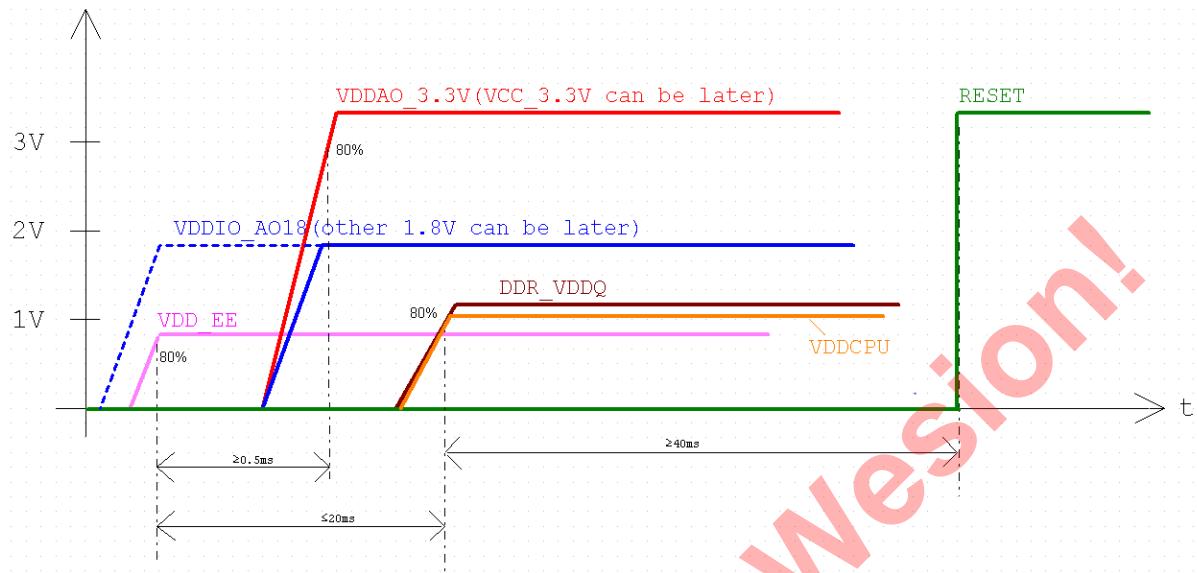

No.	POC_0 (SPI_NAND)	POC_1 (USB_BOOT)	POC_2 (SPI_NOR, eMMC/NAND )	1st Boot device	2nd Boot device	3rd Boot device	4th Boot device
1	0	0	0	USB (short delay)	SPI_NOR	NAND/eMMC	SD Card
2	0	0	1	USB (short delay)	NAND/eMMC	SD Card	-
3	0	1	0	SPI_NOR	NAND/eMMC	SD Card	USB
4	0	1	1	SPI_NAND	NAND/eMMC	USB	-
5	1	0	0	USB (short delay)	SPI_NOR	NAND/eMMC	SD Card
6	1	0	1	USB (short delay)	NAND/eMMC	SD Card	-
7	1	1	0	SPI_NOR	NAND/eMMC	SD Card	USB
8	1	1	1	NAND/eMMC	SD Card	USB	-

Note:

If GPIOC is not work as SDIO port, please do not pull CARD\_DET(GPIOC\_6) low when system booting up, to avoid romcode trying to boot from SD CARD.

## 6. Recommended Power on/down Sequence

Example power on sequence:

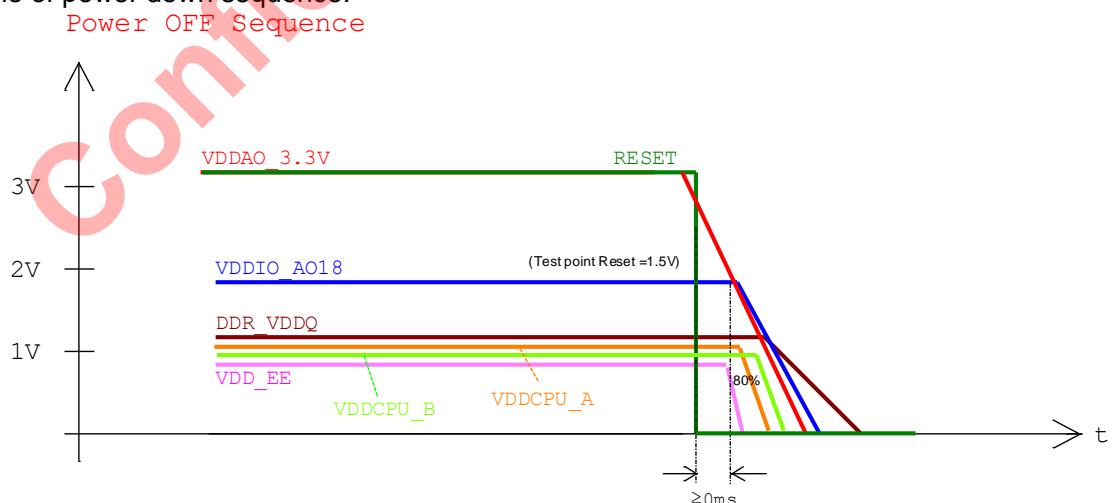

Note:

- 1) All test values refer to 80% of typical power voltage.
- 2) VDDAO\_3.3V & VCC3.3V should ramp up > 0.5ms later than VDD\_EE.
- 3) All power sources should get stable within 20ms (except for DDR\_VDDQ).
- 4) No sequence requirement between VDD18\_AO and VDD\_EE. No sequence requirement between VDDCPU\_A & VDDCPU\_B & DDR\_VDDQ and other power source.
- 5) VDDIO\_AO18 should ramps up earlier or at the same time with VDDAO\_3.3V & VCC3.3V, VDDAO\_3.3V & VCC3.3V should never be 2.5V higher than VDD18\_AO.
- 6) RESET\_n should keep low for at least 40ms after power up (except DDR\_VDDQ).

Please refer to reference schematics.

Example of power down sequence:

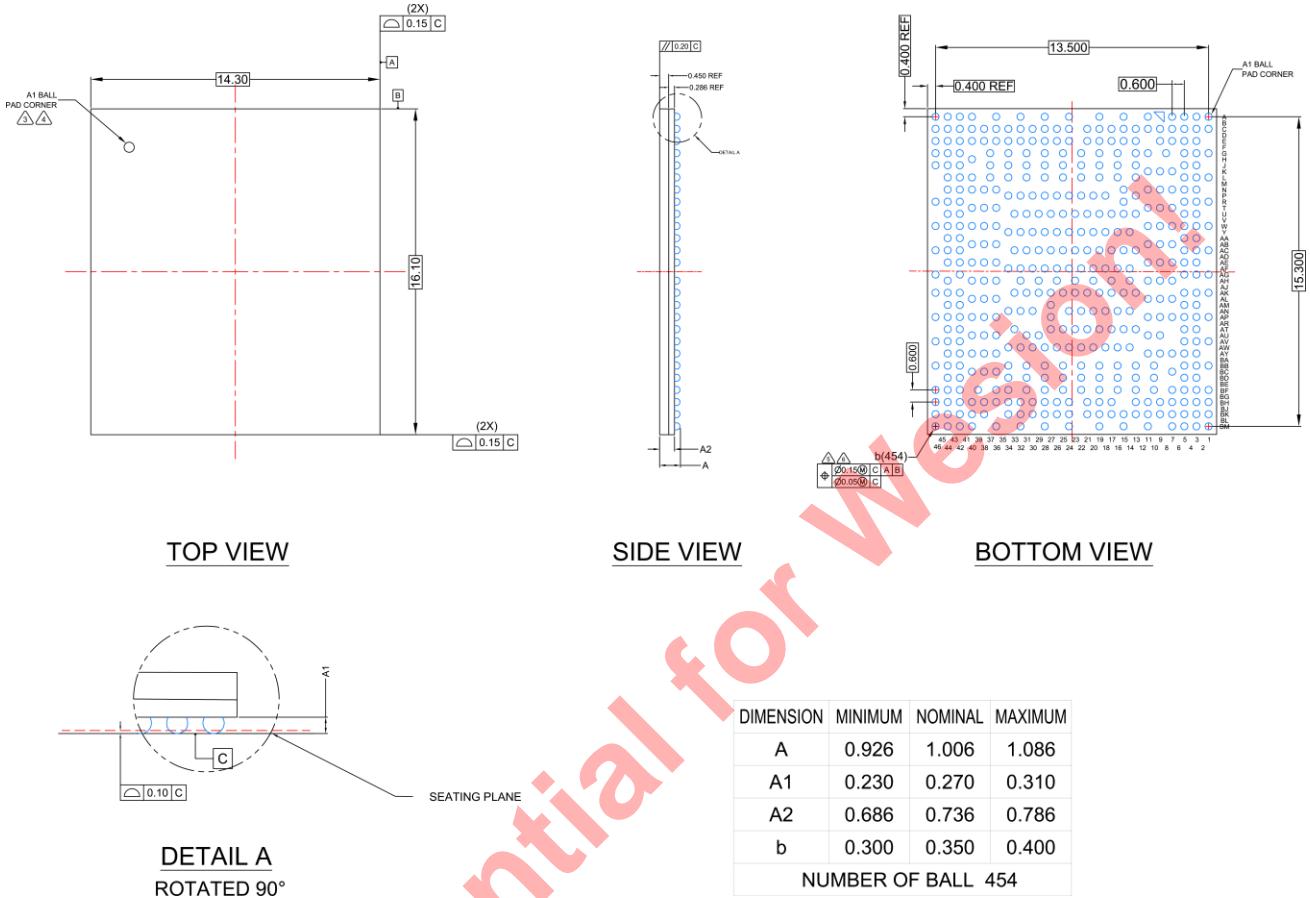

Note:

A reset IC should monitor VDDIO3.3V, output lower (lower than 1.5V) before other power rails turning off. There is no power off sequence between other power rails.

## 7. Mechanical Dimensions

The A311D processor comes in a 52x46 ball matrix FCBGA RoHS package. The mechanical dimensions are given in millimeters as the following figures.

**Figure 7-1 Dimensions**

## 8. System

---

This part describes the A311D system architecture from the following aspects:

- MEMORY MAP
- POWER DOMAIN
- CPU and GPU SUBSYSTEM
- CLOCK AND RESET UNIT
- SYSTEM BOOT
- GENERAL PURPOSE INPUT/OUTPUT (GPIO)
- INTERRUPT CONTROLLER
- DIRECT MEMORY ACCESS CONTROLLER (DMAC)
- TIMER
- Crypto

Confidential for Version!

## 8.1 Memory Map

A311D's memory map is listed as following in Table 8-1.

**Table 8-1 A311D Memory Map**

START	END	REGION (NORMAL)
FFFFF0000	FFFFFFFFF	A53_ROM
FFFE8000	FFFFFFFFF	
FFFA0000	FFFE7FFF	AHB SRAM
FFE80000	FFF9FFFF	
FFE40000	FFE7FFFF	mali
FFE0D000	FFE3FFFF	
FFE0B000	FFE0CFFF	
FFE09000	FFE0AFFF	USBCTRL
FFE07000	FFE08FFF	EMMCC/NAND

## 8.2 Power Domain

Figure 8-2 shows the power domain of A311D.

Figure 8-2 Power Domain

### 8.2.1 Top Level Power Domains

The power supplies for the different domains must follow a specific power supply order: The A53/A73 can't be powered without the EE domain. The EE domain can't be powered up without the AO domain. If you read Table 8-2 left to right then right to left, that's essentially the power up/down sequence for the entire chip.

**Table 8-2 Power on Sequence of Different Power Domains**

	Always On	EE Domain		A73 Domain				A53 Domain		
	Logic	EE Logic	Mali and DOS and VPU	L2 Cache	CPU0	CPU1	CPU2/3	L2 Cache	CPU0	CPU1
STATE 0 All off	Off	OFF		The A73 domain must be off if the EE domain is OFF				OFF	OFF	OFF
STATE 1 AO ON only	ON	Off	OFF	The A73 domain must be off if the EE domain is OFF				OFF	OFF	OFF
STATE 2 A53/A73 OFF only	On	On	ON/OFF	Off	Off	Off	Off	OFF	OFF	OFF
STATE 3 L2C ON only	On	On	ON/OFF	ON	Off		Off	ON	OFF	OFF
STATE 4 SMP - example	On	On	ON/OFF	ON	On		Off	ON	ON	OFF
STATE 5 SMP - example	On	On	ON/OFF	ON	On		On	ON	ON	ON

### 8.2.2 A53/A73 Big Little Power Modes

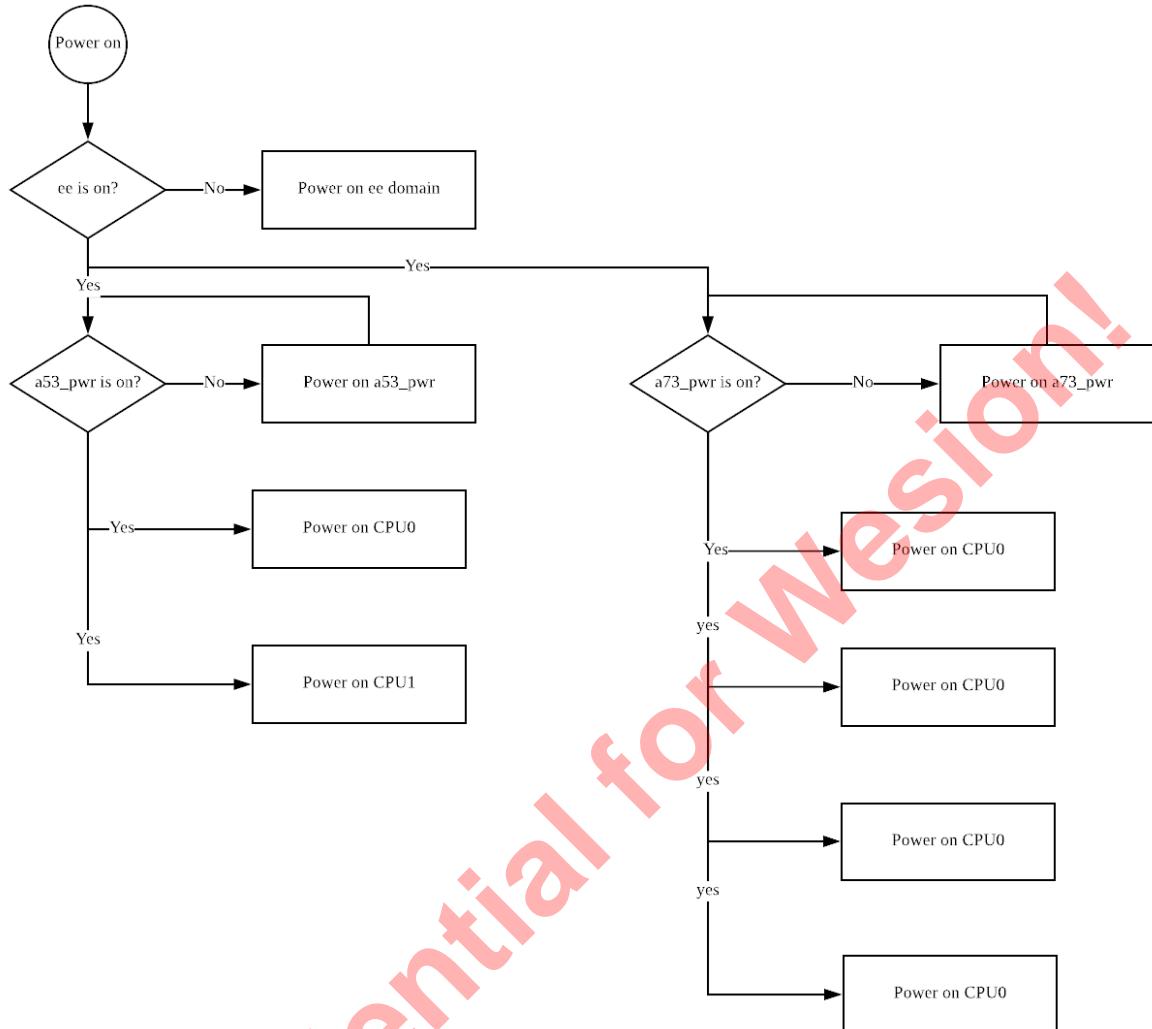

The A53 and a73 domain is the last to power up and the first to power down. The A73 domain itself consists of a quad (4) CPU, an L2 cache controller and an SCU. The A53 domain itself consists of a dual (2) CPU, an L2 cache controller and an SCU. The A53 CPU boots with the SCU/L2 powered and CPU0 powered. After CPU0 boots, subsequent CPU's can be enabled and disabled independently of one another using the control bits described below. A73 domain is default shut down. Before power on CPUs inside A73, should boot up SCU/L2. Then we can power on any cores of a73 domain. The flow-diagram below illustrates the transition to each legal state.

**Table 8-3 Power On Sequence of A53**

A53	CPU0	CPU1	A53_pwr
Domain Power Sleep bit (1 = power off)	Bit[2] 0xff8000E4	Bit[4] 0xff8000E4	
Domain Power Acknowledge bit	Bit[16] 0xff8000E4	Bit[17] 0xff8000E4	
Input Signal isolation bit (1 = isolated)	Bit[0] 0xff8000E0	Bit[1] 0xff8000E0	Bit[12] 0xff8000E0
Output signal isolation bit (1 = isolated)	Bit[0] 0xff8000E0	Bit[1] 0xff8000E0	Bit[12] 0xff8000E0

**Table 8-4 Power On Sequence of A73**

A73	CPU0	CPU1	CPU2	CPU3	A73_pwr

Output signal isolation bit (1 = isolated)	Bit[0] 0xff800348	Bit[1] 0xff800348	Bit[2] 0xff800348	Bit[3] 0xff800348	Bit[12] 0xff800348

**Figure 8-3 Power Sequence of A53/A73**

### 8.2.3 EE Top Level Power Modes

EE domain is powered off by DC-DC. VDD\_EE also share the same VDD with VDDCE of A53/A73 memory arrays. So if EE domains is shut off, A53/A73 memory is also shut off. That does not matter. Before EE power domain is shut off, A53/A73 should be shut off at first.

**Table 8-5 Power Sequence of DOS**

## 8.2.4 Mali Power Modes

The G52 block sits within the EE domain and the G52 module itself has 4 distinct power domains:

- GL(Always ON[EE])
- CG(PD0)
- SC0(PD1)
- SC1 (PD2)

Power on sequence: GL → CG → (SC0,SC1)

Power off sequence: (SC0,SC1) → CG → GL

## 8.2.5 Power/Isolation/Memory Power Down Register Summary

Below lists the registers related to power domain.

Each register final address = 0xFF800000 + offset \* 4

**AO\_RTI\_PWR\_CNTL\_REG0 0x04**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R	0	Unused
17-16	R/W	0	Unused
15	R/W	0	Unused
14	R/W	1	Set to 1 to enable the crystal clock throughout the AO domain. Set to 0 to disable the crystal clock (and therefore save power)
13	R/W	0	Reserved
12-10	R/W	0	ALT_32K_INPUT_SEL: 000 = XTAL generate 32k 001 = gpio pad
9	R/W	1	EE_RESET_N: This bit is OR'd with the RESET_N signal from the pad to generate a new signal called reset_n_to_ee. Reset_n_to_ee is the general reset for the entire Everything Else domain. Therefore, if EE_RESET_N is set low, the entire Everything Else domain is reset.
8	R/W	0	RTC_OSCIN_SEL: Set this bit to 1 to mux the RTC 32khz crystal in place of the clk81 signal that comes from the Everything Else domain to drive the Always On domain.
7	R/W	0	Unused
6	R/W	0	Unused
5	R/W	0	Unused
4	R/W	0	Ee_iso_in_en
3	R/W	0	Ee_iso_out_en
2	R/W	0	Unused
1	R/W	0	Reset_iso_en
0	R/W	0	Unused

**AO\_RTI\_PWR\_SYS\_CPU\_CNTL0 0x38**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-30	R	-	A53_pwrctl3 (readback)
29-28	R	-	A53_pwrctl2 (readback)
27-26	R	-	A53_pwrctl1 (readback)

## 8.3 System Booting

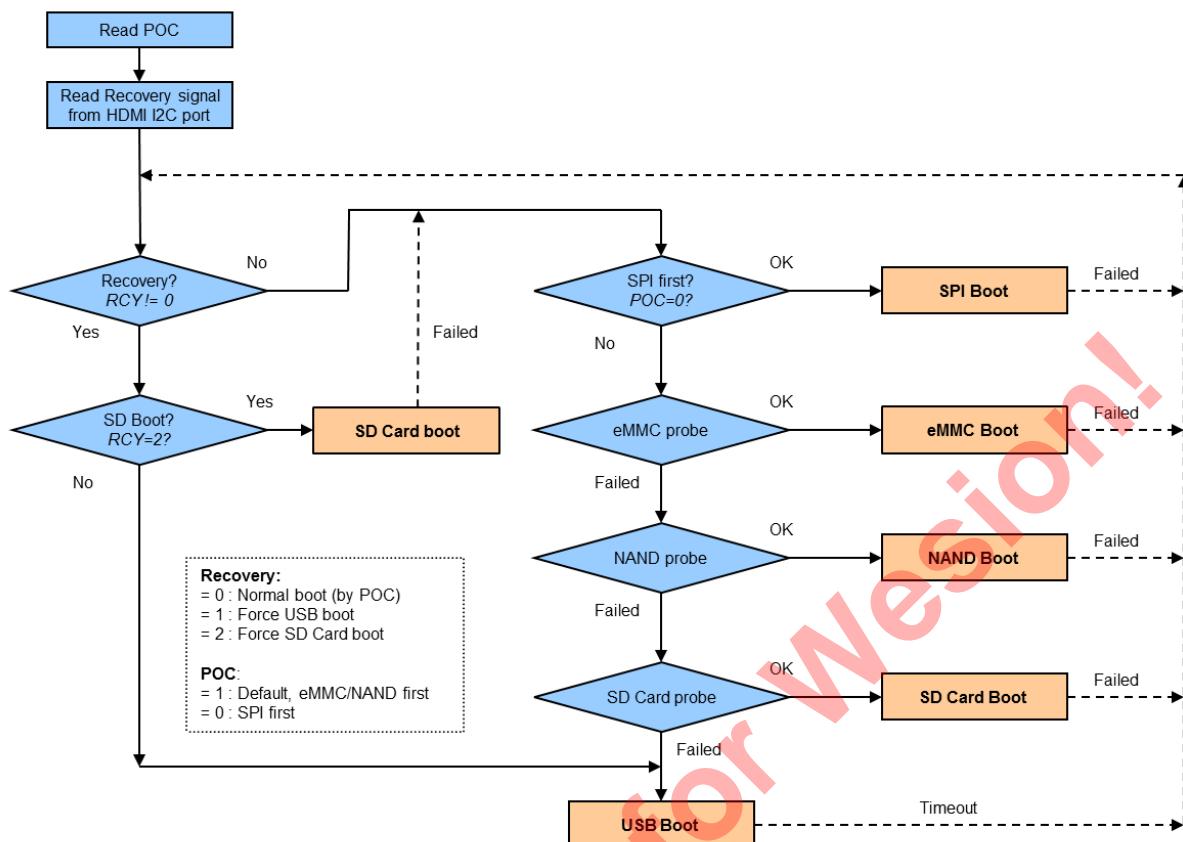

### 8.3.1 Overview

The part describes the power-on mode configuration of A311D, which include two portions: Cortex-M3 for security control and A53 for others.

### 8.3.2 Power-on Flow Chart

Figure 8-4 illustrates A311D's power on sequence.

## **Figure 8-4 Power-on Flow Chart**

## 8.4 CPU

The Cortex™-A53 MP subsystem of the chip is a high-performance, low-power, ARM macrocell with an L1 cache subsystem and an L2 cache subsystem that provide full virtual memory capabilities. The Cortex-A53 processor implements the ARMv8 architecture and runs 32-bit ARM instructions and 64 bit ARMv8 instructions. The developers can follow the ARM official reference documents for programming details.

The Cortex-A53 processor features are:

- in-order pipeline with dynamic branch prediction
- ARM, Thumb, and ThumbEE instruction set support
- TrustZone security extensions
- Harvard level 1 memory system with a Memory Management Unit (MMU)
- 128-bit AXI master interface
- ARM CoreSight debug architecture
- trace support through an Embedded Trace Macrocell (ETMv4) interface
- Intelligent Energy Manager (IEM) support with
  - asynchronous AXI wrappers
  - two voltage domains
- Media Processing Engine (MPE) with NEON technology
- Supports FPU
- Supports Hardware Virtualization

The quad core Cortex™-A73 processor is paired with A53 processor in a big.Little configuration, with each core has L1 instruction and data caches, together with a single shared L2 unified cache with A53. The developers can follow the ARM official reference documents for programming details.

The Cortex-A73 processor features are:

- Armv8-A Architecture
- 1-4x Symmetrical Multiprocessing (SMP) within a single processor cluster, and multiple coherent SMP processor clusters through AMBA 4 ACE technology
- AArch32 for full backward compatibility with Armv7
- AArch64 for 64-bit support and new architectural features
- TrustZone security technology
- NEON advanced SIMD
- DSP & SIMD extensions
- VFPv4 floating point
- Supports Hardware virtualization
- trace support through CoreSight SoC-400 interface

## 8.5 GPU

The G52 MP4 (6EE) GPU is a hardware accelerator for 2D and 3D graphics system which compatible with the following graphics standards: OpenGL ES 3.2 Vulkan 1.1 and OpenCL 2.0. The developers can follow the ARM and Khronos official reference documents for programming details.

## 8.6 NPU

### 8.6.1 Overview

NPU is the process unit which is dedicated to neural network. It is designed to accelerate the neural network arithmetic in field of AI(artificial intelligence) such as machine vision and natural language processing.

Figure below shows the hardware structure of Neural Network Accelerator.

**Figure 8-5 Hardware Architecture Diagram of Neural Network Accelerator**

NPU supports the following features.

- Host interface
  - 32bit AHB interface used for configuration only support single mode access
  - 128bit AXI interface used to fetch data memory
- Neural Network
  - Support integer 8, integer 16 convolution operation
  - 768MAC (multiply-add units) per cycle (int 8)
  - 192MAC per cycle (int 16)
  - Support Liner, MIMO, Fully Connected, Fully Convolution
  - Unlimited network size (bound by system resource)
  - Inference Engine: Tensorflow, Tensorflow lite, Darknet, Onnxc Caffe, Caffe2, Pytorch, Keras backend, OpenCL, OpenVX
  - Support network sparse coefficient decompression
  - Support Max, average pooling
  - Max pooling support 2x2, 3x3, stride <= min (input width, input height)
  - Local average pooling size <= 11x11
  - Support unpooling
  - Support batch normalize, l2 normalize, local response normalize, Instance normalize
  - Support region proposal
  - Support permute, reshape, concat, depth to space, space to depth, flatten, reorg, squeeze and

split

- Support prior\_box layer
- Support non-max Suppression
- Support ROI pooling
- Convolution size NXN, N <= 11\*stride, stride <= min(input width, input height)
- Support dilate convolution, N <= 11\*stride, stride <= min(input width, input height), dilation < 1024
- Support de-convolution, N <= 11\*stride, stride <= min(input width, input height)
- Support Element\_wise add, div, floor, max, mul,scale,sub
- Support ReLU, Leaky ReLU, Softmax, PreLU, Sigmoid, Tanh
- Support LSTM, RNN
- Support channel shuffle
- Support dequantize, dropout
- Include embedded lookup table
- Support hashtable lookup
- Support lsh projection
- Support svdf
- Support reserve

## 8.6.2 Register Description

### AQHiClockControl 0x0000

Bit(s)	R/W	Name	Description
0	R/W	CLK3D_DIS	Disable 3D clock. Software core clock disable signal for 3D modules(clk_3d) clock. When set to 1, this clock is frozen.
1	R/W	CLK2D_DIS	Disable 2D clock. Software clock disable signal. For this core both bits CLK3D_DIS and CLK2D_DIS should be controlled by software. The AXI interface clock is the only block not stalled at that point.
8:2	R/W	FSCALE_VAL	Core clock frequency scale value.
9	R/W	FSCALE_CMD_LOAD	Core clock frequency scale value enable. When writing a 1 to this bit, it updates the frequency scale factor with the value FSCALE_VAL[6:0]. The bit must be set back to 0 after that. If this bit is set and FSCALE_VAL=0 (an invalid combination), the HREADYOUT output signal will get stuck to 0.
10	R/W	DISABLE_RAM_CLOCK_GATING	Disables clock gating for rams.
13	R/W	DISABLE_RAM_POWER_OPTIMIZATION	Disables ram power optimization.
16	R	IDLE3_D	3D pipe is idle.
19	R/W	ISOLATE_GPU	Isolate GPU bit. Used for power on/off, isolation only for multi-core GPUs.
23:20	R/W	MULTI_PIPE_REG_SELECT	Determines which HI/MC to use while reading registers.

### AQHidle 0x0001

Bit(s)	R/W	Name	Description
0	R	IDLE_FE	FE is idle.
1	R	IDLE_SH	SH is idle.
31	R	AXI_LP	AXI is in low power mode.

### AQAxistatus 0x0003

Bit(s)	R/W	Name	Description
9	R	DET_RD_ERR	Detect read error
8	R	DET_WR_ERR	Detect write error
7:4	R	RD_ERR_ID	Read Error ID
3:0	R	WR_ERR_ID	Write Error ID

**AQIntrAcknowledge 0x0004**

Bit(s)	R/W	Name	Description
31:0	R	INTR_VEC	For each interrupt event, 0=Clear, 1=InterruptActive Bit 31 is AXI_BUS_ERROR, 0 = No Error.

**AQIntrEnbl 0x0005**

Bit(s)	R/W	Name	Description
31:0	R/W	INTR_ENBL_VEC	0: Disable interrupt; 1: Enable interrupt

**GCChipRev 0x0009**

Bit(s)	R/W	Name	Description
31:0	R	REV	Revision

**GCChipDate 0x000A**

Bit(s)	R/W	Name	Description
31:0	R	DATE	Date.

**gcTotalCycles 0x001E**

Bit(s)	R/W	Name	Description
31:0	R/W	CYCLES	

**gcregHIChipPatchRev 0x0026**

Bit(s)	R/W	Name	Description
7:0	R	PATCH_REV	

**gcProductId 0x002A**

Bit(s)	R/W	Name	Description
3:0	R	GRADE_LEVEL	0: None-no extra letter on the product name 1:N-Nano 2:L-Lite 3:UL-UltraLite
23:4	R	NUM	Product Number
27:24	R	TYPE	VIP (OpenVX/VIP only core)
31:28	R		When 27:24=5 (VIP core type), these bits provide the Neural Network core count for the IP: 0 = 0 NN(baseline), 1 = 1 NN(S variant), 2 = 2 NN(D variant), 4 = 4 NN (Q variant), 8 = 8 NN (O variant)

**gcModulePowerControls 0x0040**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
0	R/W	ENABLE_MODULE_CLOCK_GATING	Enables module level clock gating.
1	R/W	DISABLE_STALL_MODULE_CLOCK_GATING	Disables module level clock gating for stall condition.
2	R/W	DISABLE_STARVE_MODULE_CLOCK_GATING	Disables module level clock gating for starve/idle condition.
7:4	R/W	TURN_ON_COUNTER	Number of clock cycles to wait after turning on the clock.
31:16	R/W	TURN_OFF_COUNTER	Counter value for clock gating the module if the module is idle for this amount of clock cycles.

**gcregMMUAHBControl 0x00E2**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
0	W	MMU	Enable the MMU. For security reasons, once the MMU is enabled it cannot be disabled anymore. writeOnce

**gcregMMUAHBTArrayBaseAddressLow 0x00E3**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
31:0	R/W	ADDRESS	32 bit Address for MMUTableArrayBaseLow 32bit.

**gcregMMUAHBTArrayBaseAddressHigh 0x00E4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
7:0	R/W	MASTER_TLB	Upper 8-bits of the master TLB address to form a true 40-bit address.
8	R/W	MASTER_TLB_SECURE	Bit that defines whether the master TLB address is secure or not
9	R/W	MASTER_TLB_SHAREABLE	Bit that defines whether the master TLB address is shareable or not.

**gcregMMUAHBTArraySize 0x00E5**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
15:0	R/W	SIZE	16 bit MMUTableArraySize.

**gcregCmdBufferAHBCtrl 0x00E9**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
15:0	W	PREFETCH	Number of 64-bit words to fetch from the command buffer.
16	W	ENABLE	Enable the command parser. 0 => DISABLE 1 => ENABLE

**gcregHiAHBControl 0x00EA**

Bit(s)	R/W	Name	Description
0	R/W	SOFT_RESET	Soft resets the IP. 1 => ENABLE 0 => DISABLE
1	R/W	DEBUG_MODE	Enable debug mode if disabled debug registers return 0xFFFF FFFF. 1 => ENABLE 0 => DISABLE

**gcregAxiAHBConfig 0x00EB**

Bit(s)	R/W	Name	Description
3:0	R/W	AWID	
7:4	R/W	ARID	
11:8	R/W	AWCACHE	Set AWCACHE[3:0] value
15:12	R/W	ARCACHE	Set ARCACHE[3:0] value
17:16	R/W	AXDOMAIN_SHARED	Configure AxDOMAIN value for shareable request
19:18	R/W	AXDOMAIN_NON_SHARED	Configure AxDOMAIN value for non-shareable request
23:20	R/W	AXCACHE_OVERRIDE_SHARED	Configure AxCACHE value for shareable request

**AQMemoryDebug 0x0105**

Bit(s)	R/W	Name	Description
7:0	R/W	MAX_OUTSTANDING_READS	Limits the total number of outstanding read requests.

**AQRegisterTimingControl 0x010B**

Bit(s)	R/W	Name	Description
7:0	R/W	FOR_RF1P	For 1 port RAM
15:8	R/W	FOR_RF2P	For 2 port RAM
17:16	R/W	FAST_RTC	RTC for fast RAM
19:18	R/W	FAST_WTC	WTC for fast RAM
20	R/W	POWER_DOWN	Power down memory
21	R/W	DEEP_SLEEP	Deep sleep. Bit to allow SOC to manage sleep for embedded memories.
22	R/W	LIGHT_SLEEP	Light sleep. Bit to allow SOC to manage sleep for embedded memories.

**AQCmdBufferAddr 0x0195**

Bit(s)	R/W	Name	Description
30:0	W	ADDRESS	Base address for the command buffer. The address must be 64-bit aligned and it is always physical. You can write all bits (the virtual bit is legacy). This register cannot be read. To check the value of the current fetch address use AQFEDebugCurCmdAdr. This WRITE ONLY register it has no set reset value.
31	W	TYPE	0 => SYSTEM 1 => VIRTUAL_SYSTEM

**AQFEDebugCurCmdAdr 0x0199**

Bit(s)	R/W	Name	Description
31:3	R	CUR_CMD_ADR	This is the command decoder address. It has no reset value. READ ONLY

## 8.7 Clock

### 8.7.1 Overview

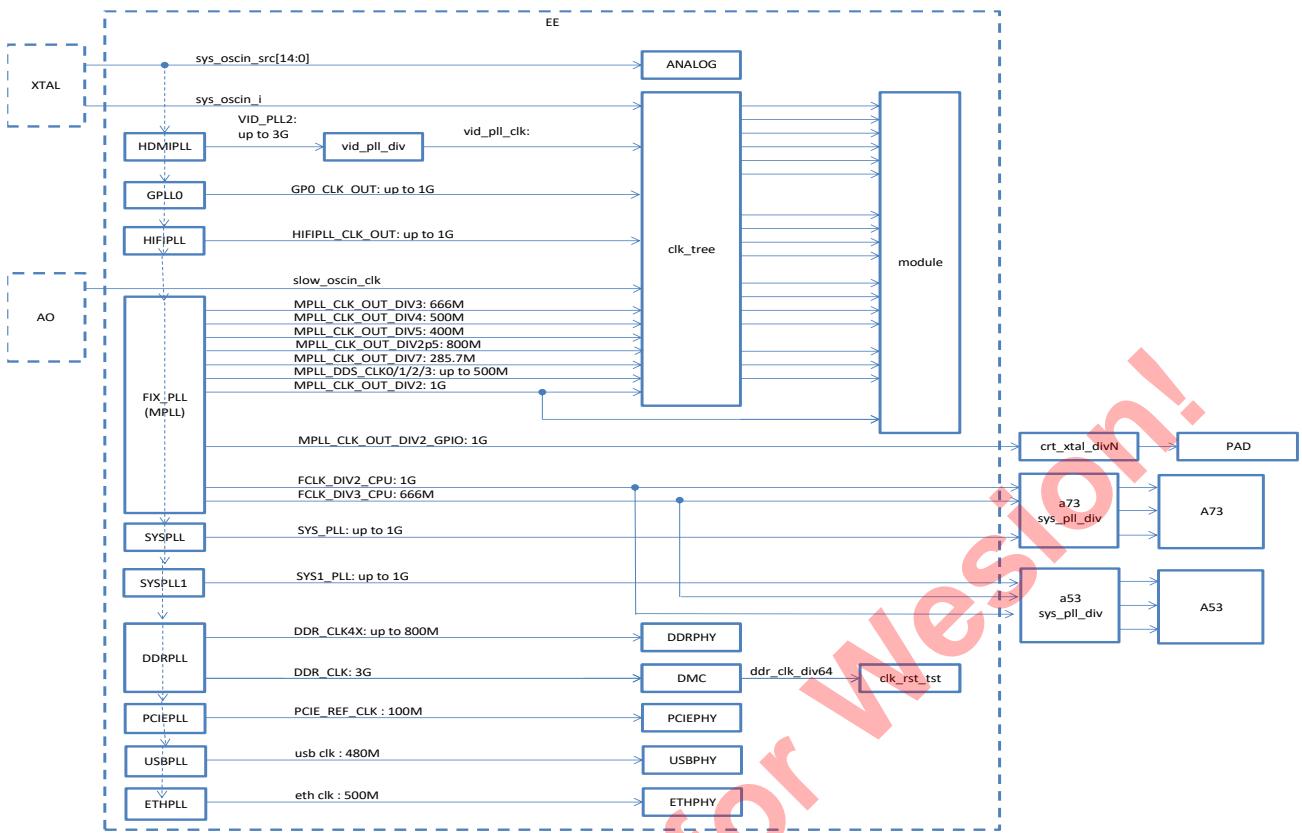

The clock and reset unit is an APB slave module that is designed for generating all of the internal and system clocks, resets of chip. A311D uses an external 24MHz crystal; there are 10 PLLs: MPLL(FIXPLL), SYS\_PLL, SYS1\_PLL, HDMI\_PLL, GP0\_PLL, DDR\_PLL, HIFI\_PLL, PCIE\_PLL, ETHPHY\_PLL and USBPHY\_PLL, as shown in the following table.

**Table 8-9 A311D PLLs**

Type	Output Clock	Integer/Fractional	MAX FREQ	Spread Spectrum
SYS_PLL	SYS_CLK_OUT	Fractional	6G	yes
SYS1_PLL	SYS1_CLK_OUT	Fractional	6G	yes
GP0_PLL	GP0_CLK_OUT	Fractional	6G	yes
HIFI_PLL	HIFI_CLK_OUT	Fractional	6G	yes
PCIE_PLL	PCIE_REF_CLK_N/P		100M(fixed)	yes
ETHPHY_PLL	ETH_CLK		500M(fixed)	No
USBPHY_PLL	USB_CLK		480M(fixed)	No
MPLL	FCLK_DIV2_CPU		1G(fixed)	No
	FCLK_DIV3_CPU		666M(fixed)	No
	MPLL_CLK_OUT_DIV2_GPIO		1G(fixed)	No
	MPLL_CLK_OUT_DIV2		1G(fixed)	No
	MPLL_CLK_OUT_DIV2p5		800M(fixed)	No
	MPLL_CLK_OUT_DIV3		666M(fixed)	No
	MPLL_CLK_OUT_DIV4		500M(fixed)	No
	MPLL_CLK_OUT_DIV5		400M(fixed)	No
	MPLL_CLK_OUT_DIV7		285.7M(fixed)	No
	MPLL_DDS_CLK0	Fractional	500M	No
	MPLL_DDS_CLK1	Fractional	500M	No
	MPLL_DDS_CLK2	Fractional	500M	yes
	MPLL_DDS_CLK3	Fractional	500M	yes
HDMI_PLL	HDMI_CLK_OUT	Fractional	6G	yes
	HDMI_CLK_OUT2	Fractional	6G	yes
DDR_PLL	DDR_CLK4X_OUT	Fractional	4.8G	yes
	DDR_CLK_OUT	Fractional	4.8G	No

Congratulations! You have completed the A311D Datasheet!

Clock TreesFigure 8-6 shows the clock connections of A311D. In this part, we will discuss A53/A73 clock tree, AO clock tree, HDMI clock tree and EE clock tree in detail.

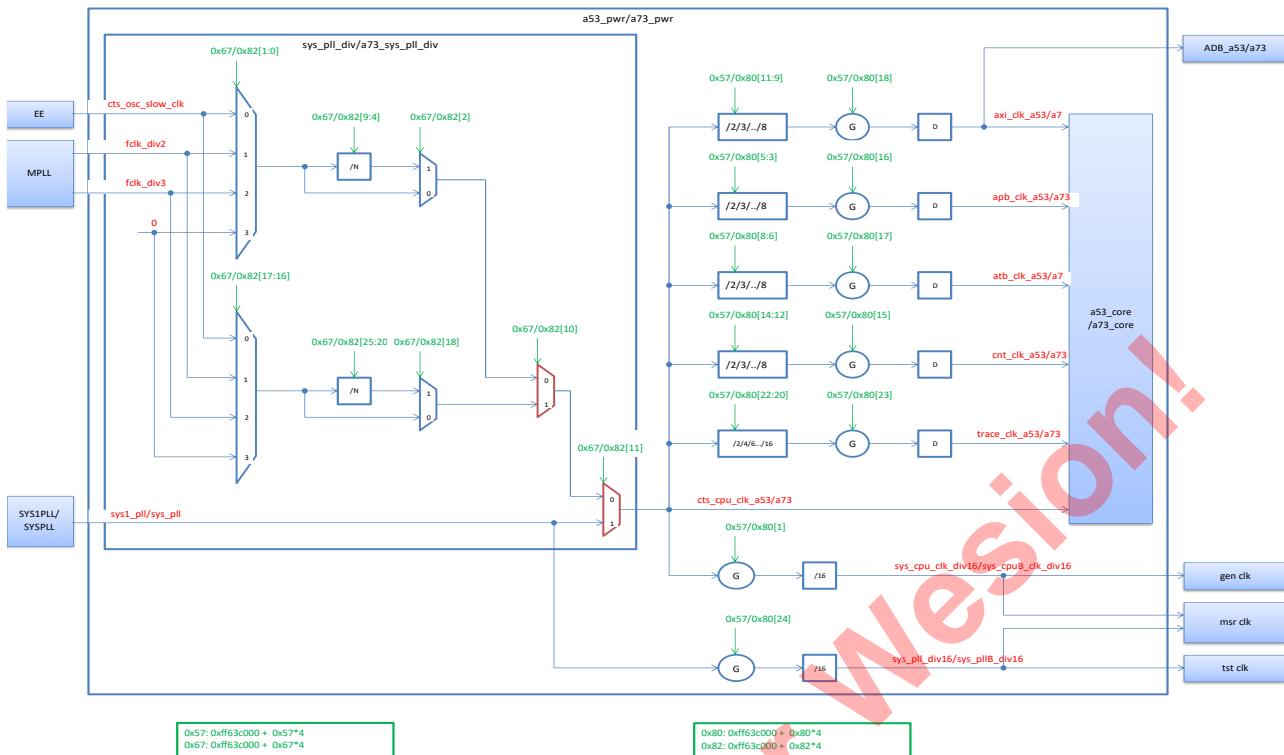

**Figure 8-6 Clock Connections**

### 8.7.1.1 A53/A73 Clock Tree

A53/A73 has 4 clock source, as shown in the following figure, among which,

4. `cts_osc_slow_clk` is for low power and debug,
5. `fclk_div2` and `fclk_div3` are for frequencies lower than 1G.
6. `sys_pll` is for frequencies higher than 1G.

Figure 8-7 Mutil Phase PLLS of A53/A73

To avoid glitch when change frequencies, there are 2 specially designed dynamic muxes, labeled by red in the above figure. When frequencies changes, the dynamic muxes will first stop the first frequency, then start the second so there will be no mixing of 2 different frequencies thus generate no frequency glitch.

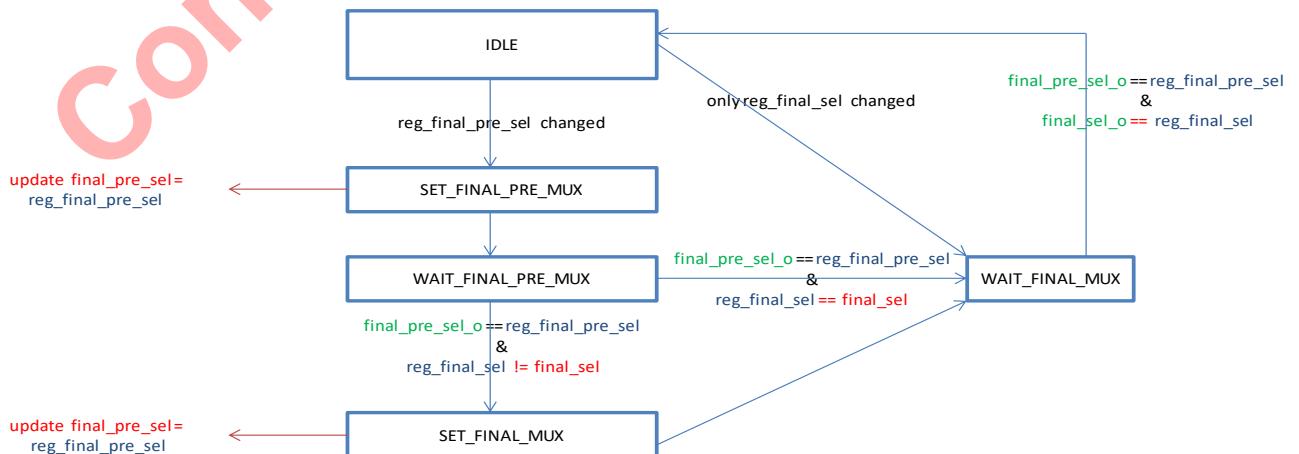

It is possible to do the following switch without glitch:

7. Between any 2 frequencies lower than 1GHz;
8. From a frequency lower than 1GHz to a frequency higher than 1GHz;

If the user want to switch between 2 frequencies both higher than 1GHz, it is strongly recommended to change to frequencies lower than 1GHz first.

The diagram of specially designed dynamic mux is shown in the following diagram:

Figure 8-8 Diagram of Dynamic Mux

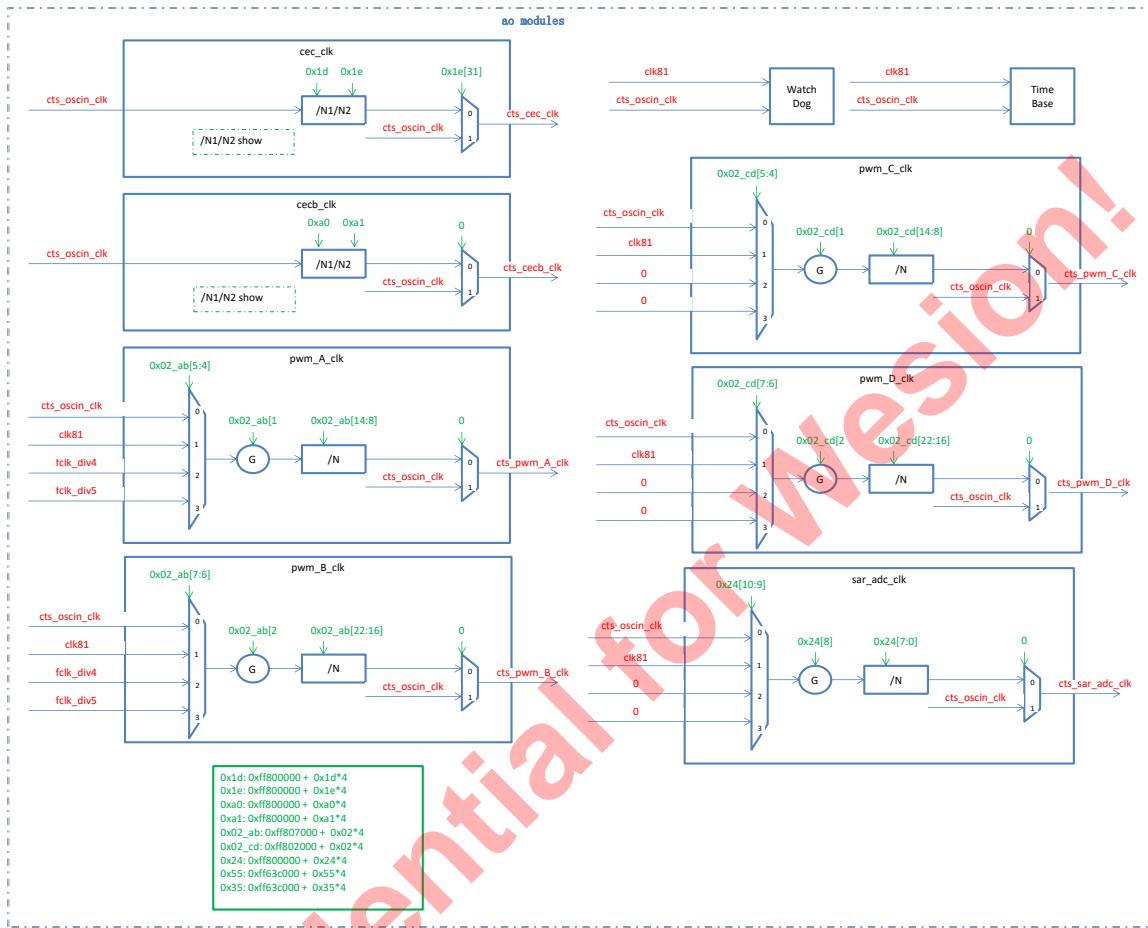

Note:

When use these 2 dynamic muxes, both control bits of these muxes have to be configured at the same time, otherwise they will not function correctly.

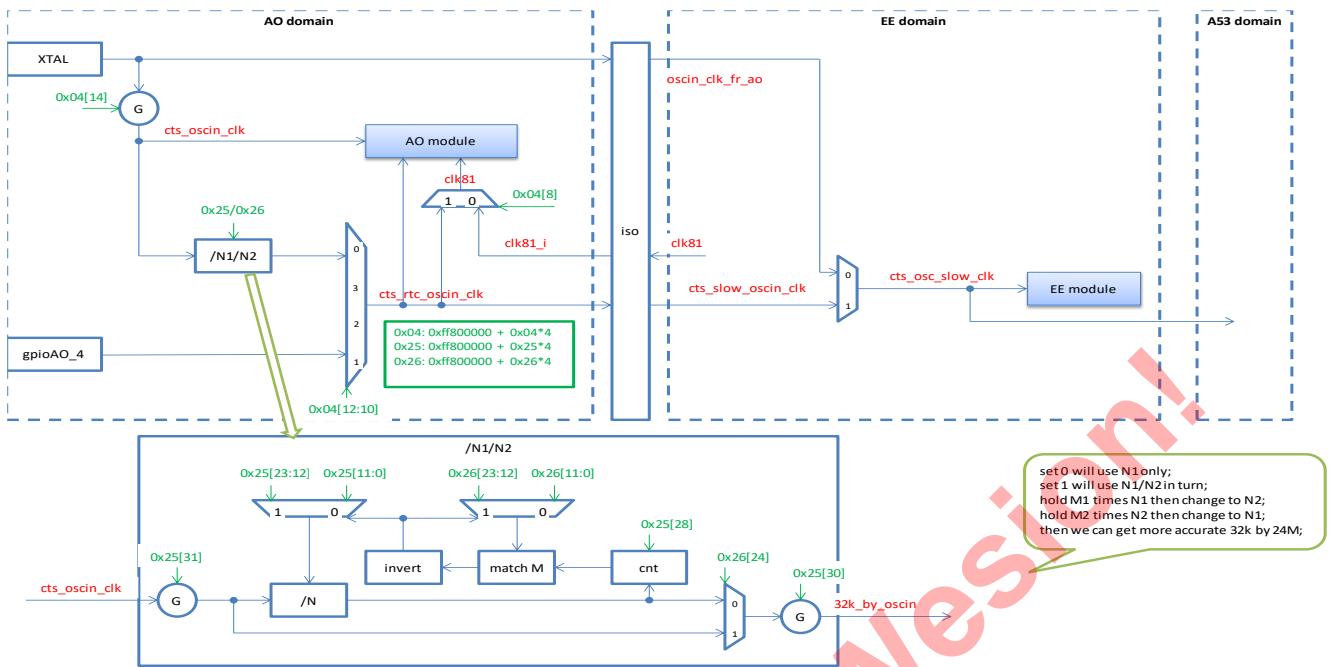

### 8.7.1.2 AO Clock Tree

The following figure shows the clock source of AO modules:

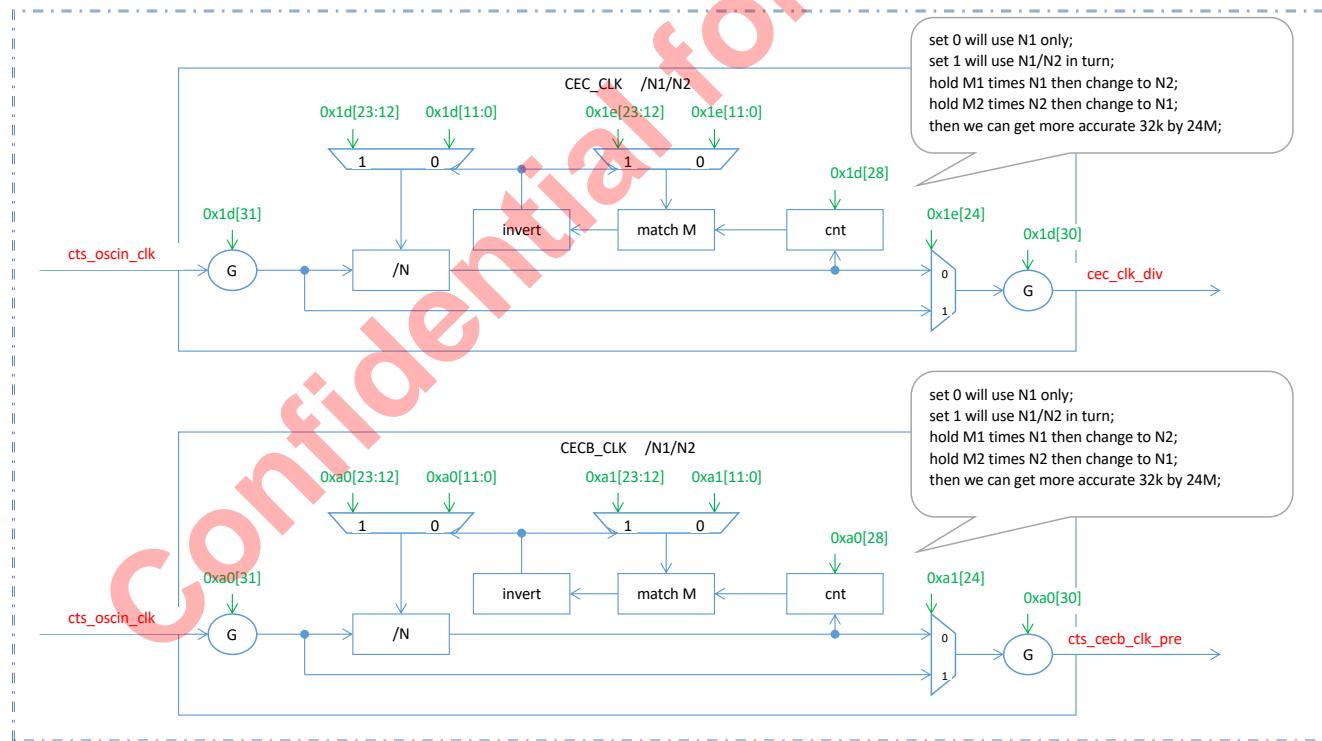

**Figure 8-9 AO Clock Sources**

For low power mode, 32KHz clock is needed, and it is generated in AO domain as shown in the following diagram:

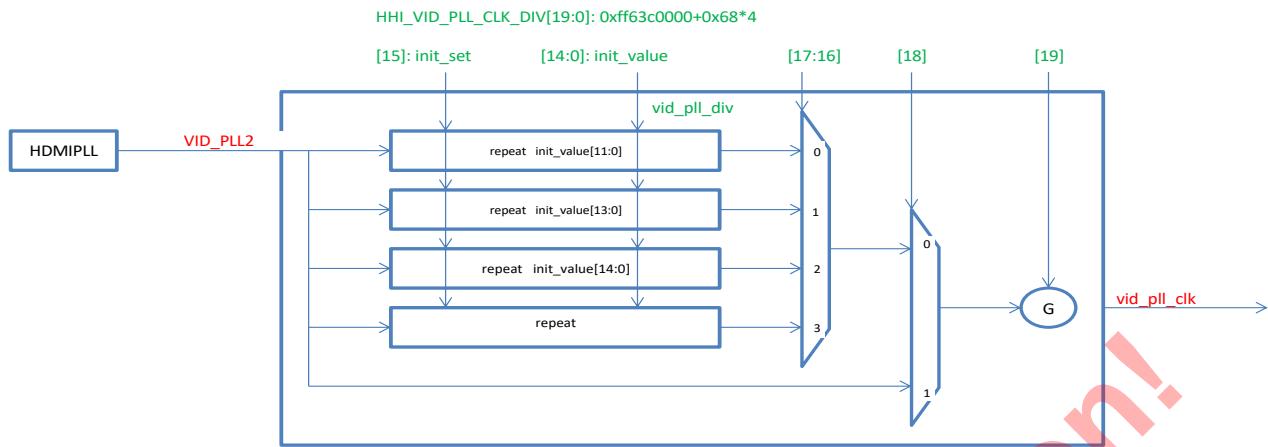

**Figure 8-10 How to generate 32KHz Clock**

To generate exact 32768Hz frequency, please check below diagram.

**Figure 8-11 How to generate 32786Hz Clock**

The HDMI\_PLL goes through vid\_pll\_div to generate new clock. The HDMI clock tree is shown in the following figure:

**Figure 8-12 HDMI Clock Tree**

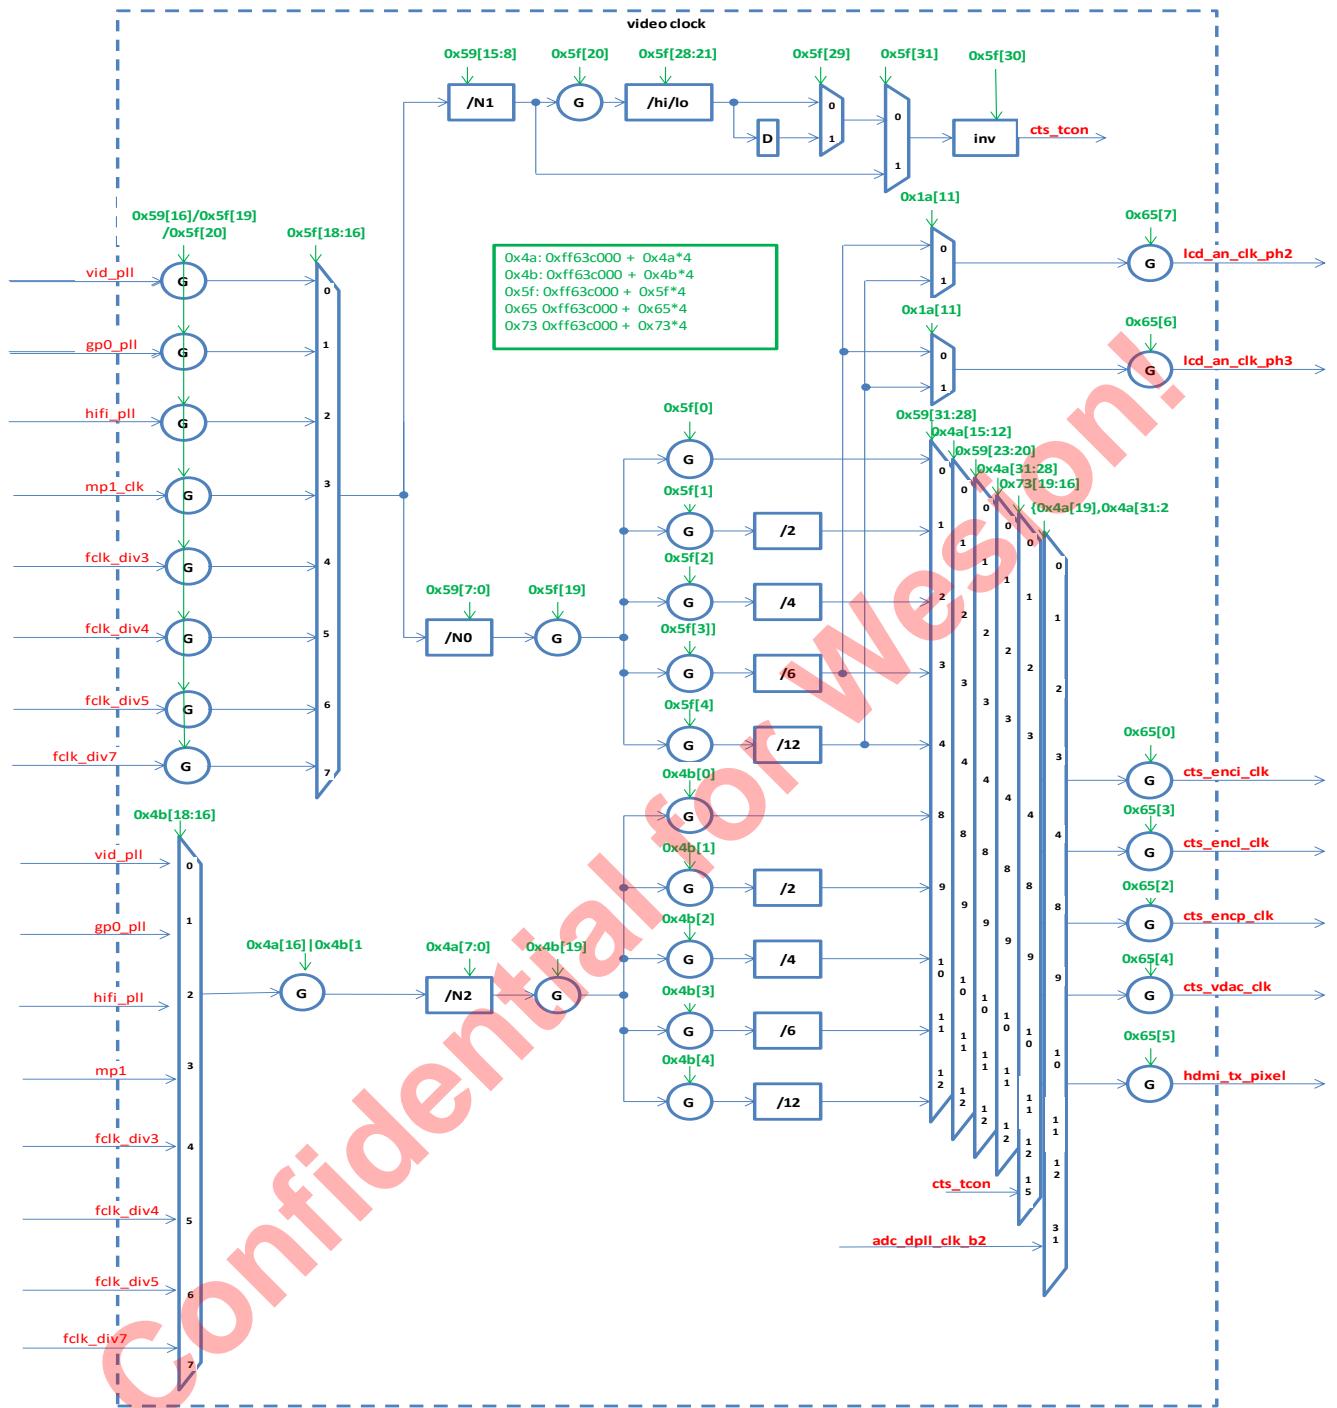

#### 8.7.1.4 EE Clock Tree

All EE clocks except video clock are listed in the following table:

**Table 8-10 EE Clock**

The video clock tree is shown as following:

Figure 8-13 Video Clock Tree

## 8.7.2 Frequency Calculation and Setting

The PLL frequency tuning step is reference clock/ $2^{17}$ .

The general frequency tuning formula is shown as below.

$$\text{Target Frequency} = 24\text{MHz} \cdot \frac{DPLL\_M + \frac{DIV\_FRAC}{2^{17}}}{DPLL\_N} \cdot \frac{1}{OD}$$

The PLL fractional value weight table(if not other stated) is shown below:

**Table 8-11 A311D Fractional Value Weight Table**

	Bit18	Bit17	Bit16	Bit15	..	..	..	..	..	..	..	..	..	..	Bit0
Weight	+/-	1	1/2	1/2^2	..	..	..	..	..	..	..	..	..	..	1/2^17

For example, to get a fractional value 0.875, you can set CNTL1[18:0] = 19'h1c000

### 8.7.2.1 SYS\_PLL/SYS1\_PLL

SYS\_PLL diagram is shown as below:

**Figure 8-14 SYS\_PLL Diagram**

DCO frequency is calculated with the following equation:

$$f_{DCO} = f_{REF} \cdot (M + frac) / N$$

OD control table is as following:

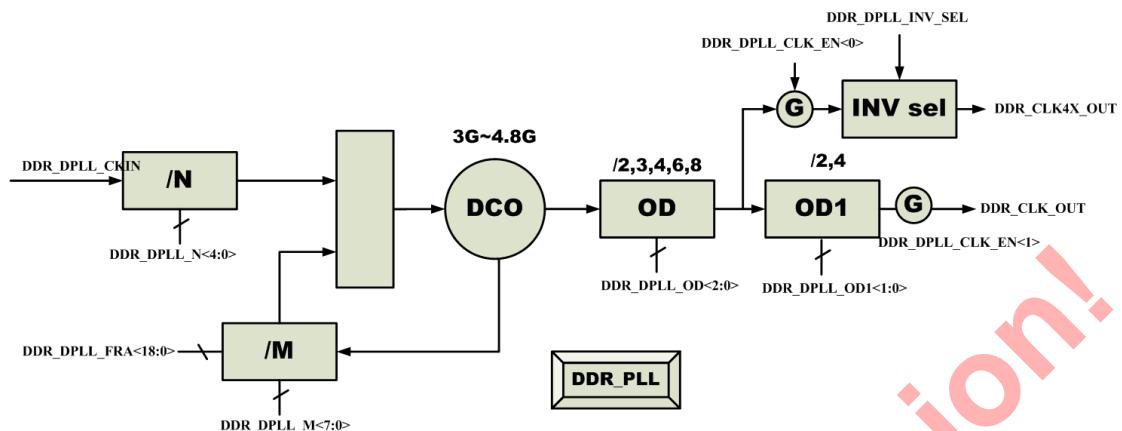

**Table 8-12 A311D SYS\_PLL OD Control Table**

Block	Register	Function
OD	SYS_DPLL_OD<2:0>	000: /1
		001:/2
		010:/4
		011:/8
		100:/16
		101:/32

### 8.7.2.2 DDR\_PLL

DDR\_PLL diagram is shown as below:

**Figure 8-15 DDR\_PLL Diagram**

DCO frequency is calculated with the following equation:

$$f_{DCO} = f_{REF} \cdot (M + frac) / N$$

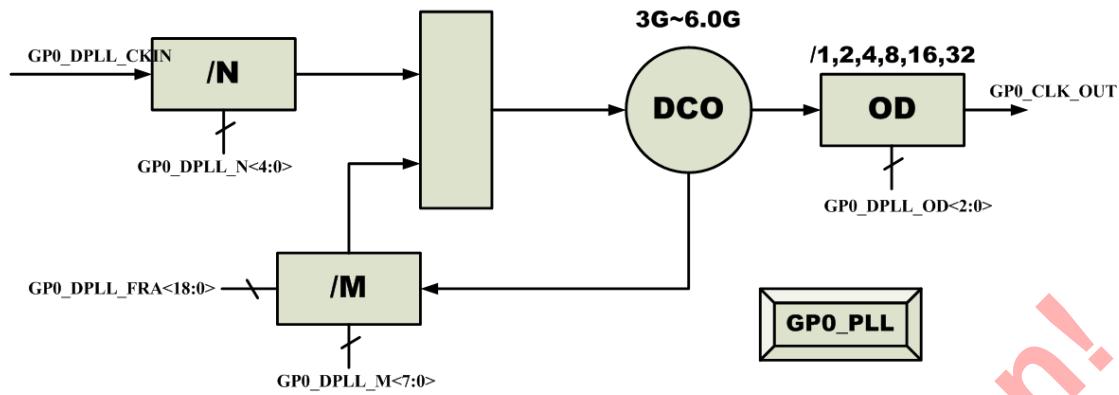

OD control table is as following:

**Table 8-13 A311D DDR\_PLL Control Table**

Block	Register	Function
OD	DDR_DPLL_OD<2:0>	000: /2
		001: /3
		010: /4
		011: /6
		100: /8
OD1	DDR_DPLL_OD1<1:0>	*0:/2
		*1:/4

### 8.7.2.3 GP0 PLL

GP0 PLL diagram is shown as below:

**Figure 8-16 GP0 PLL Diagram**

DCO frequency is calculated with the following equation:

$$f_{DCO} = f_{REF} \cdot (M + frac) / N$$

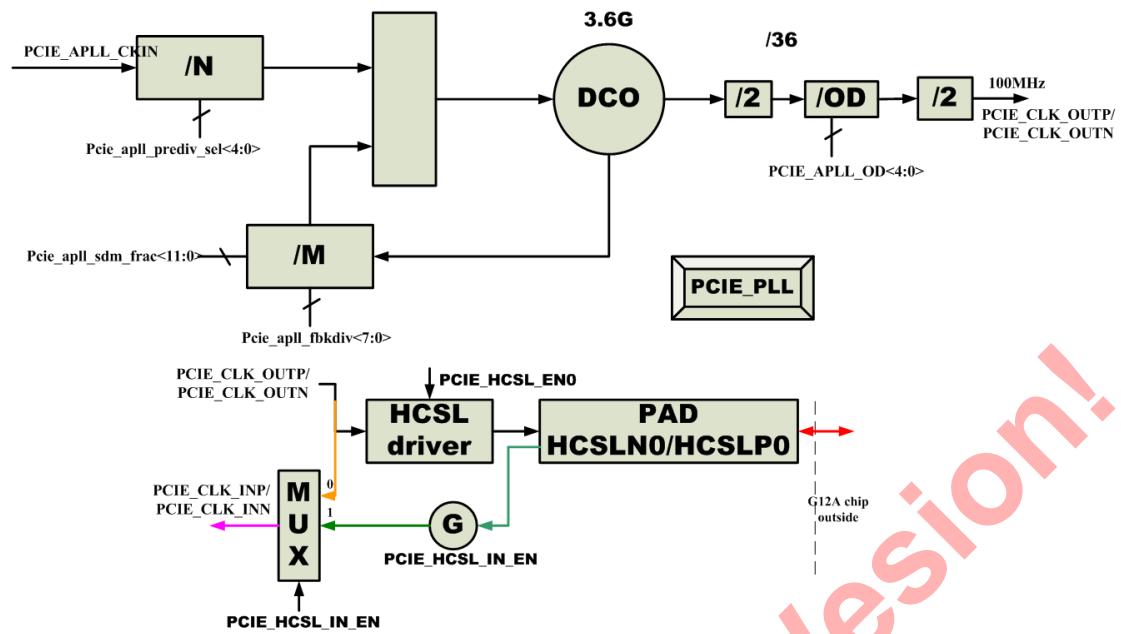

OD control table is as following:

**Table 8-14 A311D GP0 PLL OD Control Table**

Block	Register	Function
OD	GP0_DPLL_OD<2:0>	000: /1
		001:/2
		010:/4
		011:/8
		100:/16
		101:/32

#### 8.7.2.4 PCIE PLL

PCIE PLL diagram is shown as below.

**Figure 8-17 PCIE PLL Diagram**

DCO frequency is calculated with the following equation:

$$f_{DCO} = f_{REF} \cdot (M + frac) / N$$

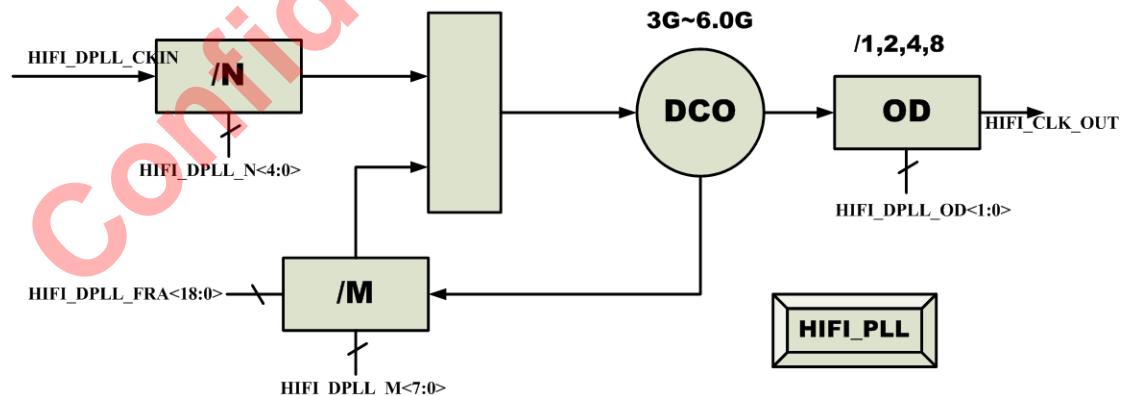

OD control table is as following:

**Table 8-15 A311D PCIE PLL OD Control Table**

Block	Register	Function
OD	PCIE_APPL_OD<4:0>	OD<4:0>=5'h09 : 1/9

### 8.7.2.5 HIFI PLL

HIFI PLL diagram is shown as below:

**Figure 8-18 HIFI PLL Diagram**

DCO frequency is calculated with the following equation:

$$f_{DCO} = f_{REF} \cdot (M + frac) / N$$

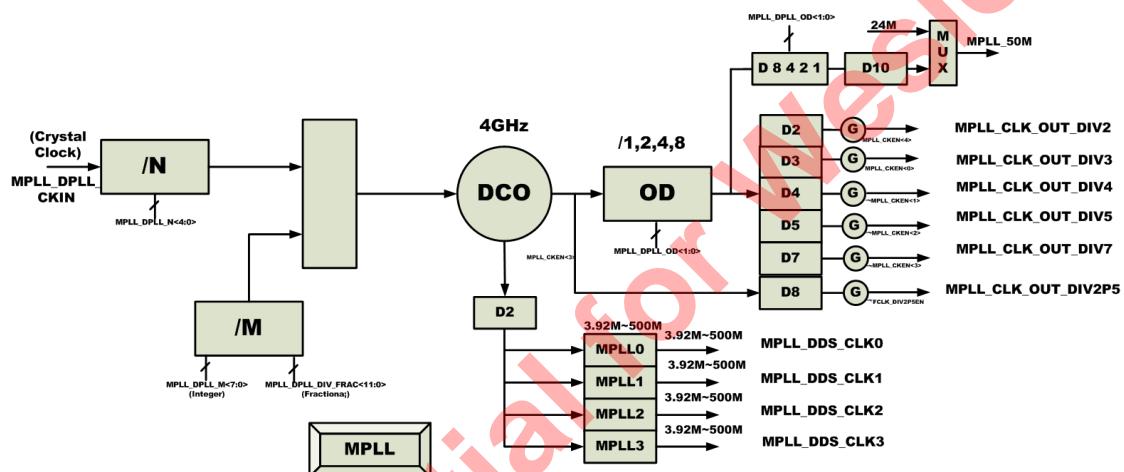

OD control table is as following:

**Table 8-16 A311D HIFI PLL OD Control Table**

Block	Register	Function
OD	HIFI_DPLL_OD<1:0>	00: /1
		01:/2
		10:/4
		10:/8

### 8.7.2.6 MPLL(Fixed PLL)

MPLL diagram is shown as below:

**Figure 8-19 MPLL Diagram**

The output frequency calculation equations are shown as following(if N>3. MPLL\_DDS\_CLK2 and MPLL\_DDS\_CLK3 has SSG function):

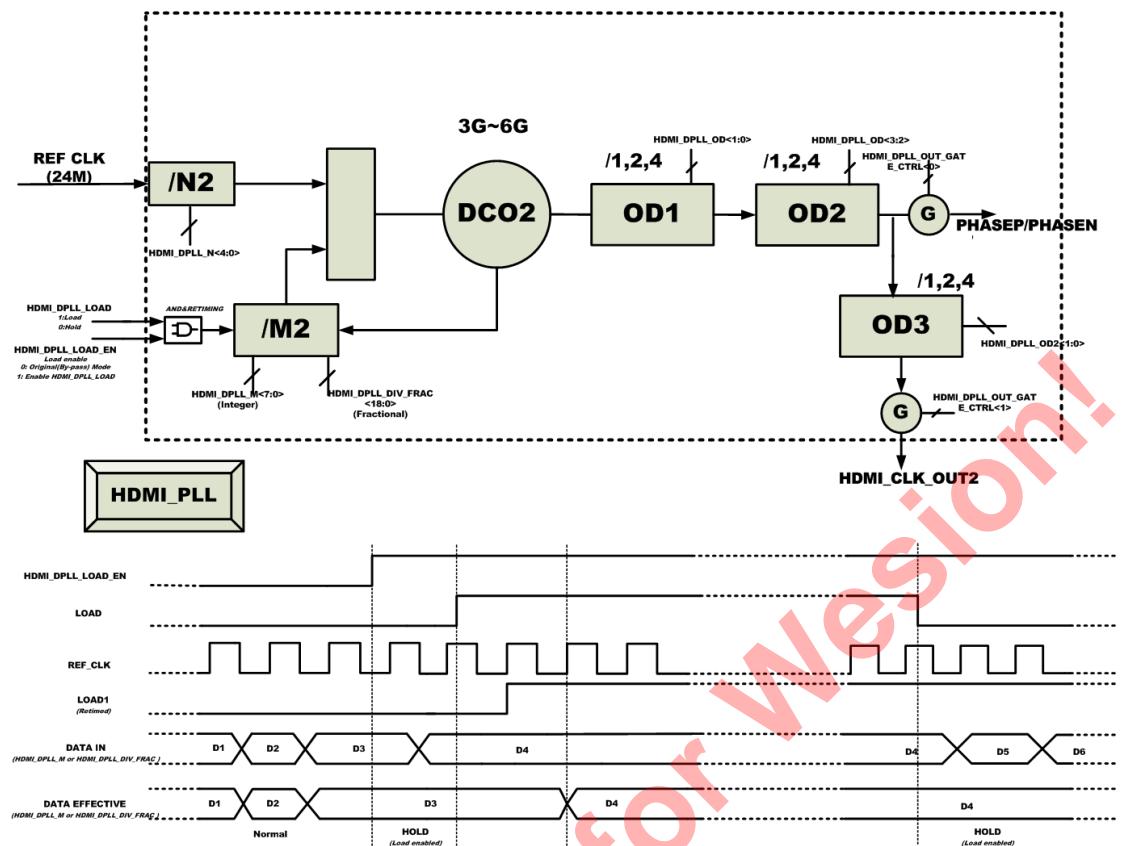

$$|F_{out\_2G}| = F_{ref} * M * OD\_FB / N$$

$$MPLL\_CLK\_OUT2 = f(N2\_integer, SDM\_IN) = \left( \frac{2\text{Ghz}}{(N2\_integer + \frac{SDM\_IN}{16384})} \right)$$

### 8.7.2.7 HDMI PLL

HDMI PLL diagram is shown as below.

Figure 8-20 HDMI PLL Diagram

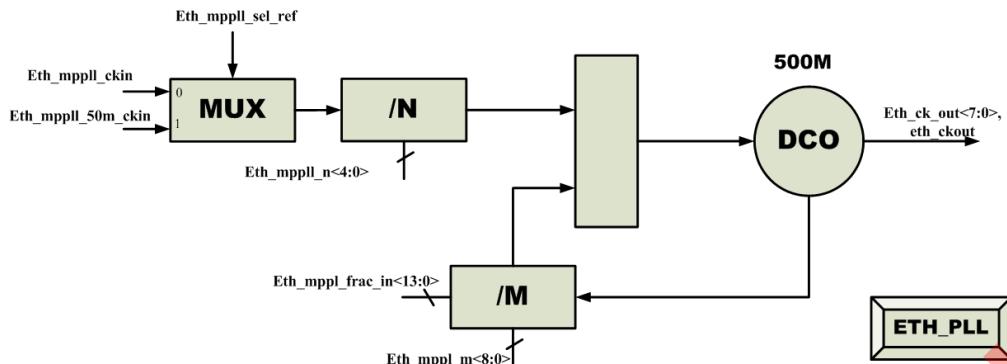

OD control table is as following:

Table 8-17 A311D HDMI PLL OD Control Table

Block	Register	Function
OD1	HDMI_DPLL_OD<1:0>	00: /1
		01:/2
		10:/4
OD2	HDMI_DPLL_OD<3:2>	00: /1
		01:/2
		10:/4
OD3	HDMI_DPLL_OD2<1:0>	00: /1
		01:/2
		10:/4

### 8.7.2.8 ETHPHY PLL

ETH PLL diagram is shown as below:

**Figure 8-21 ETH PLL Diagram**

DCO frequency is 500M.

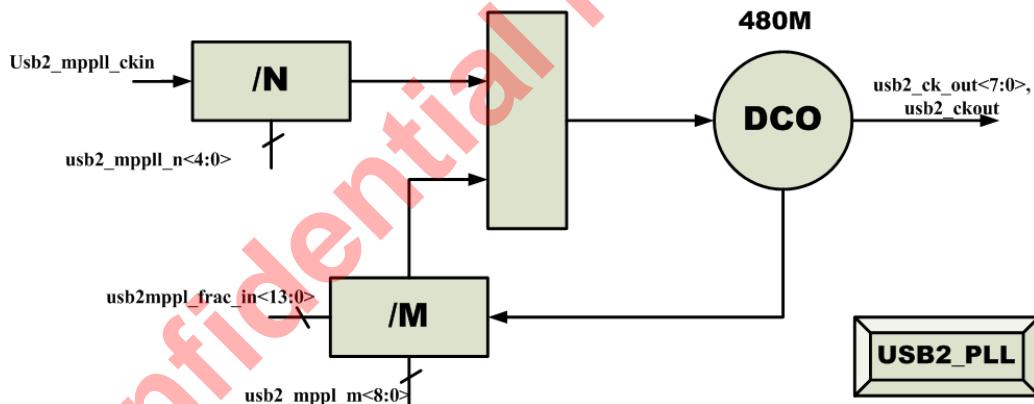

The Eth\_PLL fractional value weight table is shown below:

**Table 8-18 ETHPHY\_PLL Fractional Value Weight Table**

	Bit13	Bit12	Bit11	Bit10	..	..	..	..	..	..	..	..	Bit0
Weight	1/2	1/2^2	1/2^3	1/2^4	..	..	..	..	..	..	..	..	1/2^14

### 8.7.2.9 USBPHY PLL

USB PLL diagram is shown as below:

**Figure 8-22 USB PLL Diagram**

DCO frequency is 500M.

The USB\_PLL fractional value weight table is shown below:

**Table 8-19 USBPHY\_PLL Fractional Value Weight Table**

	Bit13	Bit12	Bit11	Bit10	..	..	..	..	..	..	..	..	Bit0
Weight	1/2	1/2^2	1/2^3	1/2^4	..	..	..	..	..	..	..	..	1/2^14

### 8.7.3 Clock Gating

Modules and sub-modules within the chip can be disabled by shutting off the clock. The control for these clocks comes from six CBUS registers that collectively make up a 64-bit register that controls the MPEG\_DOMAIN and a 32-bit register that controls the OTHER\_DOMAIN. The table below indicates the Bits associated with either the MPEG\_DOMAIN and OTHER\_DOMAIN gated clock enables. The table is organized by function rather than by bit order because it makes it easier to determine how to turn on/off

a particular function within the chip. If a bit is set high, the clock is enabled. If a bit is set low, the clock is turned off and the module is disabled.

**Table 8-20 AO Domain Clock Gating CBUS 0x1055 control Bits**

Address	Bit(s)	Module Description
0xff80004C	31:10	Unused
	9	AO2DDR_AHB
	8	SARADC
	7	IR_OUT
	6	AO_UART2
	5	PROD_I2C

#### 8.7.4 Clock Measure

The chip contains a module that can measure the frequency of internal clock. The frequency measurement is a simple counter measurement in which the counter (driven by MCLK) is enabled for a programmable amount of time. The sources are listed in the following table.

Table 8-22 Clock Measure Source

No	Source

### 8.7.5 Register Description

#### HIU(base:32'hFF63C000)

Each register final address = 0xFF63C000 + offset \* 4

##### HHI\_MIPI\_CNTL0 0x00

Bit(s)	R/W	Default	Description
31:16	R/W	0	REGISTER CONTROL B<15:10>:common ref gen control B9:Vref select 0=VR 1=Vbg B8:Iref select 0=I_rout 1=Ibg B7:enable Ibg B6/5:unused B<4:0>:VR trimming control 10mV/step Work mode:1010,0100,1000,0111
15:0	R/W	0	REGISTER CONTROL B3:VR gen from Ibg enable, B2:VR gen by avdd18 enable Other bits unused set 0 Work mode:0000,0000,0000,1000

##### HHI\_MIPI\_CNTL1 0x01

Bit(s)	R/W	Default	Description
19	R/W	0	dsi_edp_aux_tx_en AUX TX ENABLE(useless)
18	R/W	0	dsi_prbs_clk_in CLOCK FROM CORE FOR TEST.(max frequency 1GHZ)
17	R/W	0	dsi_edp_aux_tx AUX TX INPUT(useless)
16	R/W	0	dsi_vbg_en Bandgap Enable signal

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	R/W	0	REGISTER CONTROL B<15:12>:unused B<11:8>:test output select b7:RX output inv select B6:unused B<5:4>:LPTX slew-rate select B3:LRTX leak-current enable B2:input inv select B1:input select 0=prbs 1=normal input B0:prbs7 enable Work mode:0000,0000,0010,1110

**HHI\_MIPI\_CNTL2 0x02**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	REGISTER CONTROL B<15:9>:CH cell power up B<8:3>:CH control B2/1:unused B0:LPULPS enable Work mode:0010,0110,1000,0000
15:0	R/W	0	REGISTER CONTROL B<15:11>: CH<0:4> power up B10:RX Ibias enable B9:unused B<8:0>:LPRX reference voltage control Work mode:1111,1100,0101,1010

**HHI\_MIPI\_STS 0x03**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8	R	0	AUX RX OUTPUT(useless)
7-0	R	0	LPRX and LPCD receiver primitive state data <LPCD_OUTN_L,LPCD_OUTN_L,LPCD_OUTP_ H,LPCD_OUTP_L,LP_OUTN_H,LP_OUTN_L,LP _OUTP_H,LP_OUTP_L>

**HHI\_CHECK\_CLK\_RESULT 0x04**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0	sys_cpu_clk check_result
30	R	0	sys_cpuB_clk check_result
3	R	0	ML_check_result
2	R	0	encp_check_result
1	R	0	hevcb_clk_check_result
0	R	0	mali_clk_check_result

**SCR System Clock Reference 0x0B**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R/W	0	System clock reference high: bits 31:16

**TIMEOUT\_VALUE 0x0F**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-12	R	0	Unused
11-0	R/W	0	Program timer

Increased by 1 every 900 cycles. Triggers timer interrupt to CPU when it expires.

**HHI\_GP0\_PLL\_CNTL0 0x10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

## 8.8 Reset

### 8.8.1 Overview

As shown in figure below, A311D reset are designed as following:

Each reset includes 3 control registers, reg\_reset, reg\_reset\_level, and reg\_reset\_mask, when write “1” to reg\_reset, it will generate a signal: reset\_pulse; most of module’s reset is negative, so reset\_pulse will invert to reset\_pulse\_n; the usage of reg\_reset\_level is hold reset\_pulse\_n to “0”; the usage of reg\_reset\_mask is hold reset\_pulse\_n to “1”; ao module has special soft reset control; A53 has special soft reset control.

### 8.8.2 Register Description

#### 8.8.2.1 EE Reset

RESET0\_REGISTER: 0xFFD01004

Bit(s)	R/W	Default	Description
31-27	R/W	0	Reserved
26	R/W	0	vcbus
25	R/W	0	ahb_data
24	R/W	0	ahb_cntl
23	R/W	0	cbus_capb3
22	R/W	0	Reserved
21	R/W	0	dos_capb3
20	R/W	0	Dvalin_capb3
19	R/W	0	hdmitx_capb3
18	R/W	0	Reserved

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
17	R/W	0	decode_capb3
16	R/W	0	gic
15	R/W	0	pcie_apb
14	R/W	0	pcie_phy
13	R/W	0	vcbus
12	R/W	0	pcie_ctrl_A
11	R/W	0	assist
10	R/W	0	venc
9:8	R/W	0	Reserved
7	R/W	0	vid_pll_div
6	R/W	0	afifo
5	R/W	0	viu
4	R/W	0	Reserved
3	R/W	0	ddr
2	R/W	0	dos
1	R/W	0	Reserved
0	R/W	0	hiu

**RESET1\_REGISTER: 0xFFD01008**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-30	R/W	0	Reserved
29	R/W	0	Audio codec
28:15	R/W	0	Reserved
14	R/W	0	sd_emmcC
13	R/W	0	sd_emmcB
12	R/W	0	sd_emmcA
11	R/W	0	eth
10	R/W	0	isa
9	R/W	0	Reserved
8	R/W	0	parser

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
7	R/W	0	Reserved
6	R/W	0	ahb_sram
5	R/W	0	bt656
4	R/W	0	Reserved
3	R/W	0	ddr
2	R/W	0	usb
1	R/W	0	demux
0	R/W	0	Reserved

**RESET2\_REGISTER:** 0xFFD0100C

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R/W	0	hdmitx
14	R/W	0	Dvalin
13	R/W	0	Reserved
12	R/W	0	Reserved
11	R/W	0	Reserved
10	R/W	0	parser_top
9	R/W	0	parser_ctl
8	R/W	0	parser_fetch
7	R/W	0	parser_reg
6	R/W	0	ge2d
5	R/W	0	alocker
4	R/W	0	mipi_dsi_host
3	R/W	0	Reserved
2	R/W	0	hdmi_tx
1	R/W	0	audio
0	R/W	0	Reserved

**RESET3\_REGISTER:** 0xFFD01010

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R/W	0	demux_2

14	R/W	0	demux_1
13	R/W	0	demux_0
12	R/W	0	demux_s2p_1
11	R/W	0	demux_s2p_0
10	R/W	0	demux_des_pl
9	R/W	0	demux_top
8:0	R/W	0	Reserved

**RESET4\_REGISTER:** 0xFFD01014

Bit(s)	R/W	Default	Description
15	R/W	0	i2c_m2
14	R/W	0	i2c_m1
13	R/W	0	vencl
12	R/W	0	vdi6
11:10	R/W	0	Reserved
9	R/W	0	vdac
8	R/W	0	Reserved
7	R/W	0	vencp
6	R/W	0	venci
5	R/W	0	rdma
4:3	R/W	0	Reserved
2	R/W	0	mipi_dsiphy
1:0	R/W	0	Reserved

**RESET6\_REGISTER:** 0xFFD0101c

Bit(s)	R/W	Default	Description
14	R/W	0	i2c_m3
13	R/W	0	spifc0
12	R/W	0	async1
11	R/W	0	async0
10	R/W	0	uart1_2
9	R/W	0	UART_EE_A

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8	R/W	0	ts_cpu
7	R/W	0	stream
6	R/W	0	spicc1
5	R/W	0	ts_pll
4	R/W	0	i2c_m0
3	R/W	0	sana_3
2	R/W	0	sc
1	R/W	0	spicc0
0	R/W	0	gen

**RESET7\_REGISTER: 0xFFD01020**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
13	R/W	0	hevcf_dmc_pipl
12	R/W	0	wave420_dmc_pipl
11	R/W	0	hcodec_dmc_pipl
10	R/W	0	ge2d_dmc_pipl
9	R/W	0	dmc_vpu_pipl
8	R/W	0	nic_dmc_pipl
7	R/W	0	vid_lock
6	R/W	0	Dvalin_dmc_pipl
5	R/W	0	device_mmc_arb
4	R/W	0	ts_gpu
3	R/W	0	usb_ddr3
2	R/W	0	usb_ddr2
1	R/W	0	usb_ddr1
0	R/W	0	usb_ddr0

**RESET0\_MASK: 0xFFD01040**

The Bits of this register correspond to the RESET[n] REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET1\_MASK: 0xFFD01044**

The Bits of this register correspond to the RESET[n] REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET2\_MASK: 0xFFD01048**

The Bits of this register correspond to the RESET[n] REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET3\_MASK: 0xFFD0104c**

The Bits of this register correspond to the RESET[n] REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET4\_MASK: 0xFFD01050**

The Bits of this register correspond to the RESET[n] REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET6\_MASK: 0xFFD01058**

The Bits of this register correspond to the RESET[n] REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET7\_MASK: 0xFFD0105c**

The Bits of this register correspond to the RESET[n] REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET0\_LEVEL: 0xFFD01080**

The bits of this register correspond to the RESET[n] REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET1\_LEVEL: 0xFFD01084**

The bits of this register correspond to the RESET[n] REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET2\_LEVEL: 0xFFD01088**

The bits of this register correspond to the RESET[n] REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET3\_LEVEL: 0xFFD0108c**

The bits of this register correspond to the RESET[n] REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET4\_LEVEL: 0xFFD01090**

The bits of this register correspond to the RESET[n] REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET6\_LEVEL: 0xFFD01098**

The bits of this register correspond to the RESET[n] REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET7\_LEVEL: 0xFFD0109c**

The bits of this register correspond to the RESET[n] REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to “Hold” a reset LOW (in a reset condition).

**8.8.2.2 SEC Reset**

Reset registers in EE domain are on cbus, so the final address = base\_address(0xFF64E000) + address \*4;

**RESET0\_SEC 0x00**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-7	R/W	0	Reserved
6	R/W	0	ao_mailbox
5	R/W	0	ao
4	R/W	0	dma
3	R/W	0	efuse
2	R/W	0	am_ring_osc
1	R/W	0	m4_cpu
0	R/W	0	ao_cpu

**RESET1\_SEC 0x01**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R/W	0	sys_core3
14	R/W	0	sys_core2
13	R/W	0	sys_core1
12	R/W	0	sys_core0
11	R/W	0	sys_core3
10	R/W	0	sys_core2
9	R/W	0	sys_core1
8	R/W	0	sys_core0
7	R/W	0	sys_pll_div
6	R/W	0	presetn_sys_cpu_capb3
5	R/W	0	rom_boot
4	R/W	0	syscpu_axi
3	R/W	0	syscpu_I2

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
2	R/W	0	syscpu_preset
1	R/W	0	syscpu_mbist
0	R/W	0	sys_cpu_cpu

**RESET0\_SEC\_LEVEL: 0xFF64E040**

The bits of this register correspond to the RESET[n]\_SEC REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET1\_SEC\_LEVEL: 0xFF64E044**

The bits of this register correspond to the RESET[n]\_SEC REGISTERs above. The default of this register is 0xFFFFFFFF. Setting any bit to 0, forces the corresponding RESET LOW. This registers allows the software to "Hold" a reset LOW (in a reset condition).

**RESET0\_SEC\_MASK 0xFF64E080**

The Bits of this register correspond to the RESET[n]\_SEC REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**RESET1\_SEC\_MASK 0xFF64E084**

The Bits of this register correspond to the RESET[n]\_SEC REGISTERs above. If a bit is set in this register, then when the watchdog timer fires, that particular module will NOT be reset.

**AO Soft Reset****AO\_SOFT\_RESET 0XFF800040**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	Reserved
23	R/W	0	ir_out
22	R/W	0	uart2
21	R/W	0	Reserved
20	R/W	0	sar_adc
19	R/W	0	i2c_s
18	R/W	0	i2c_m
17	R/W	0	uart
16	R/W	0	ir_in
15:0	R/W	0	Reserved

**A53\_SOFT\_RESET 0xFF63C160**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10	R/W	0	syscpu_axi

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
9	R/W	0	syscpu_preset
8	R/W	0	syscpu_l2
7	R/W	0	sys_core3
6	R/W	0	sys_core2
5	R/W	0	sys_core1
4	R/W	0	sys_core0
3	R/W	0	sys_core3_por
2	R/W	0	sys_core2_por
1	R/W	0	sys_core1_por
0	R/W	0	sys_core0_por

**A73\_SOFT\_RESET 0xFF63C204**

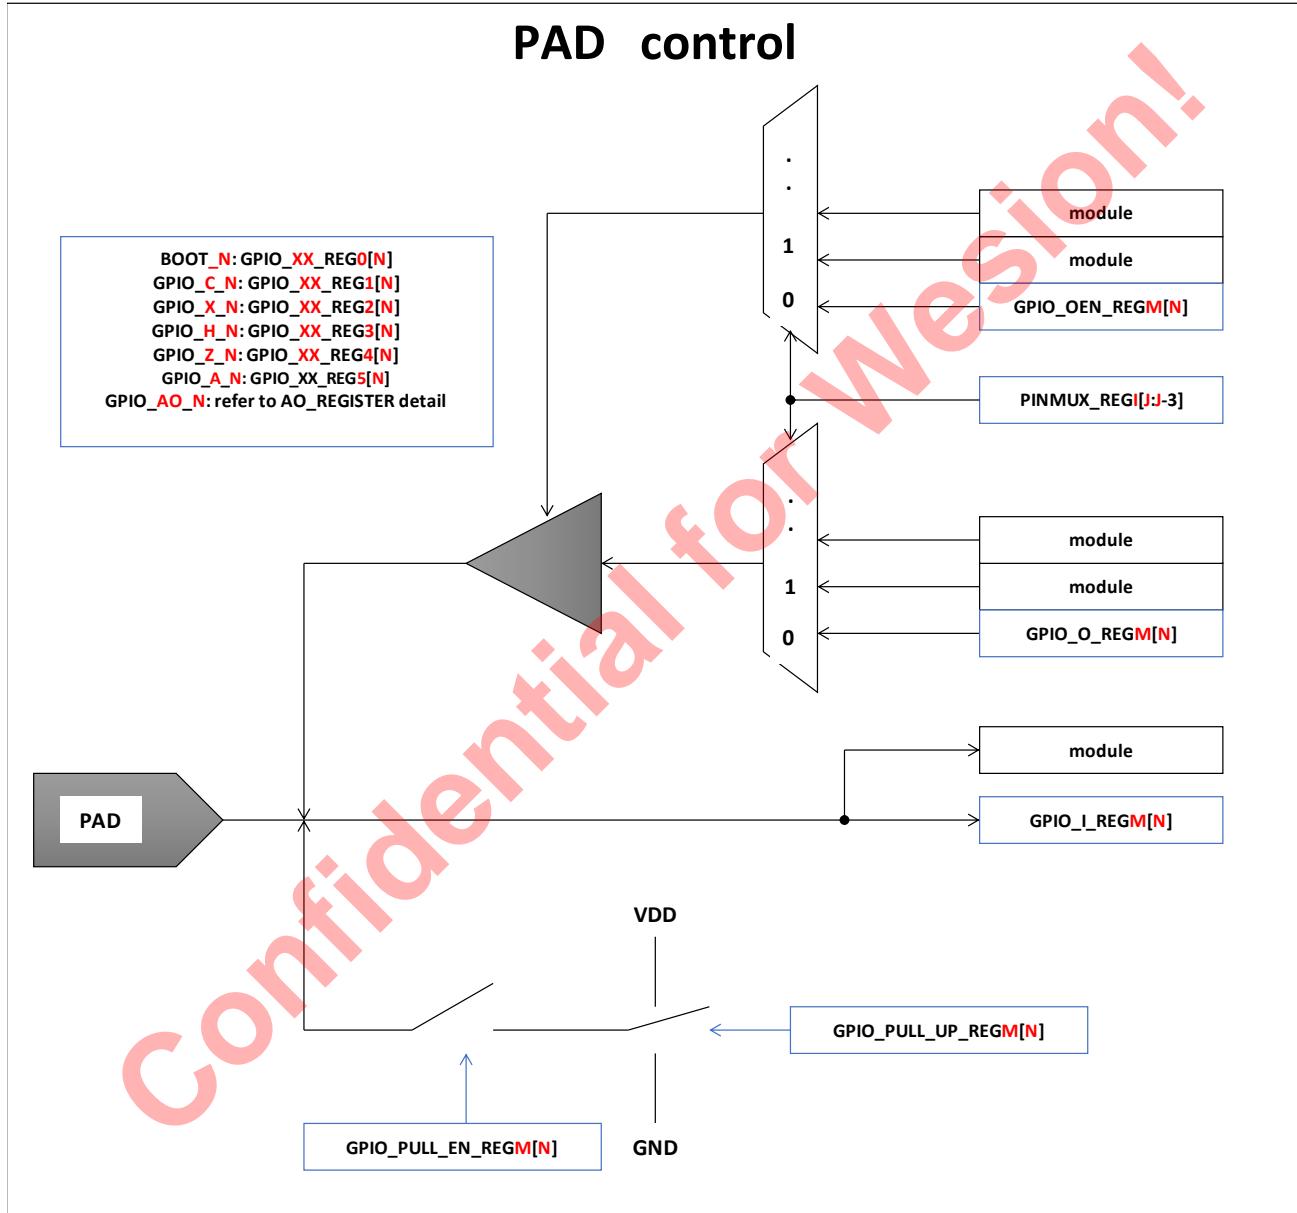

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10	R/W	0	syscpu_axi
9	R/W	0	syscpu_preset
8	R/W	0	syscpu_l2
7	R/W	0	sys_core3
6	R/W	0	sys_core2
5	R/W	0	sys_core1
4	R/W	0	sys_core0
3	R/W	0	sys_core3_por
2	R/W	0	sys_core2_por
1	R/W	0	sys_core1_por
0	R/W	0	sys_core0_por

## 8.9 GPIO

### 8.9.1 Overview

The SOC has a number of multi-function digital I/O pads that can be multiplexed to a number of internal resources (e.g. PWM generators, SDIO controllers). When a digital I/O is not being used for any specific purpose, it is converted to a general purpose GPIO pin. A GPIO pin can be statically set to high/low logical levels. The structure of a GPIO is given below.

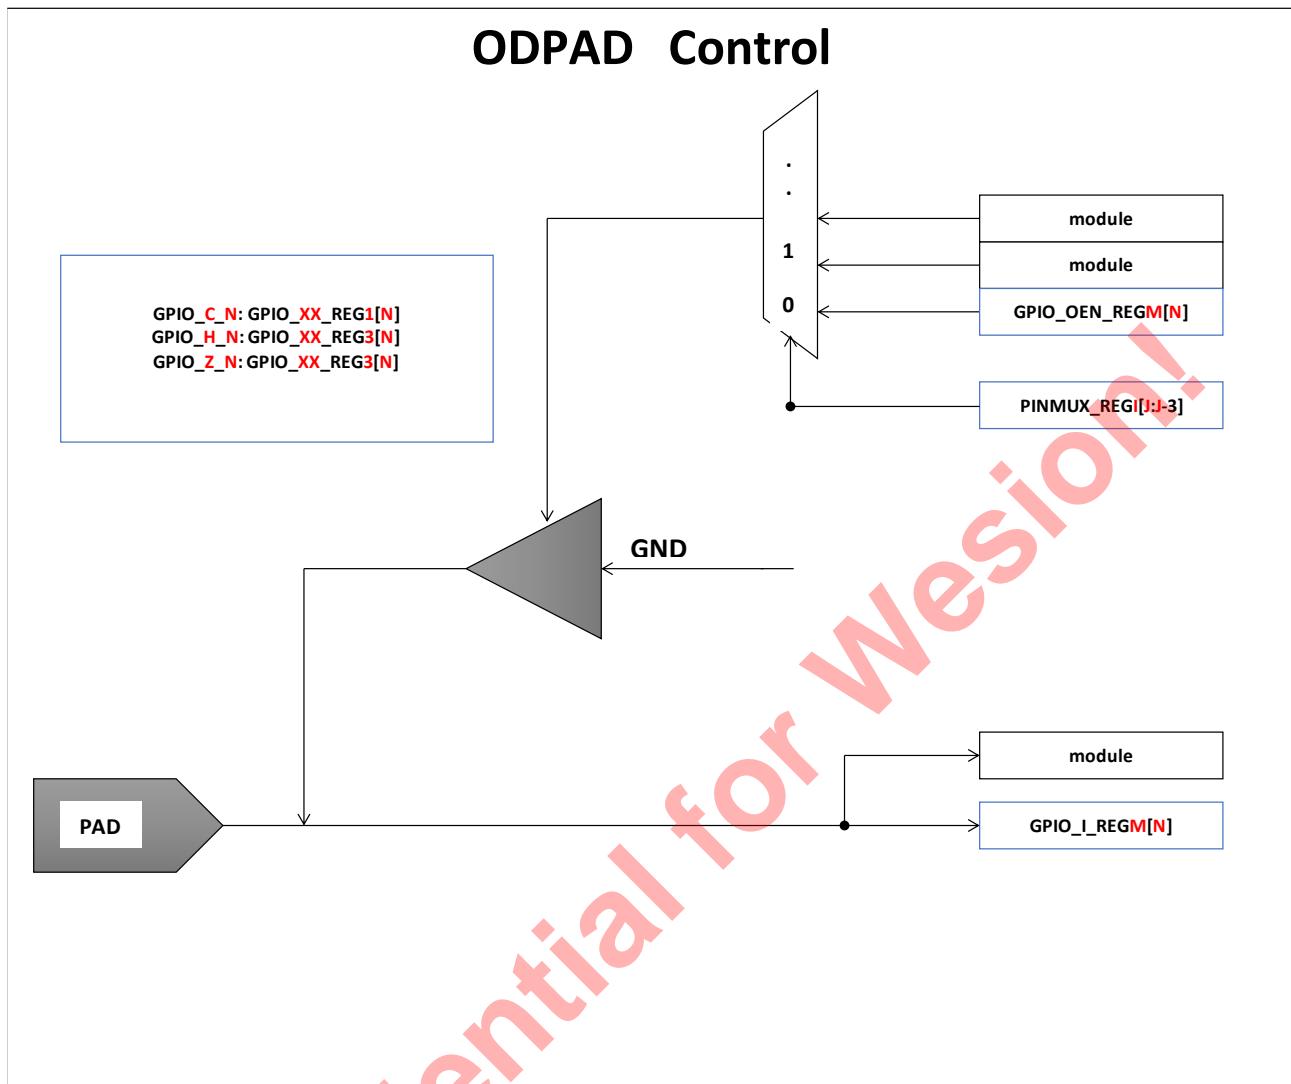

Figure 8-24 GPIO Structure

Each GPIO pad has 6 related registers, among which GPIO\_O\_REG is used to control the output of the pad, GPIO\_I\_REG is used to store the input value of the pad; GPIO\_OEN\_REG is used to enable GPIO output function, PINMUX\_REG is used to define the function, GPIO\_PULL\_EN\_REG is used to enable the pull-up function of GPIO pad, and GPIO\_PULL\_UP\_REG is used to set the GPIO pull up/down. For AO GPIO pads, refer to AO GPIO registers.

There are OD pins that can note be used as output, with difference structure, shown as following.

Figure 8-25 OD Pad Structure

### 8.9.2 GPIO Multiplex Function

The GPIO multiplex functions are shown in the sections below, where the RegNN[MM] corresponds to CBUS registers defined in Table 8-23. The base address is 0xff634400 for PERIPHS\_PIN\_MUX\_X, PREG\_PAD\_GPIO\_EN\_N, PREG\_PAD\_GPIO\_O, PREG\_PAD\_GPIO\_I, PAD\_PULL\_UP\_EN\_REG, PAD\_PULL\_UP\_REG; and 0xff800000 for AO\_RTI\_PIN\_MUX\_REG, the final address is calculated as: final address = base address + offset\*4.

Table 8-23 Pin Mux Registers

Pin Mux Registers	Offset
AO_GPIO_I	0x0a
AO_GPIO_O	0x0d
AO_GPIO_O_EN_N	0x09
AO_RTI_PULL_UP_REG	0x0b
AO_RTI_PULL_UP_EN_REG	0x0c

Pin Mux Registers	Offset

### 8.9.3.1 Pin MUX Registers

#### PERIPHS\_PIN\_MUX\_0 0xb0

Bit(s)	R/W	Default	Description
[3:0]	R/W	0	pin mux select bits for BOOT_0
[7:4]	R/W	0	pin mux select bits for BOOT_1
[11:8]	R/W	0	pin mux select bits for BOOT_2
[15:12]	R/W	0	pin mux select bits for BOOT_3
[19:16]	R/W	0	pin mux select bits for BOOT_4
[23:20]	R/W	0	pin mux select bits for BOOT_5
[27:24]	R/W	0	pin mux select bits for BOOT_6
[31:28]	R/W	0	pin mux select bits for BOOT_7

#### PERIPHS\_PIN\_MUX\_1 0xb1

Bit(s)	R/W	Default	Description
[3:0]	R/W	0	pin mux select bits for BOOT_8
[7:4]	R/W	0	pin mux select bits for BOOT_9
[11:8]	R/W	0	pin mux select bits for BOOT_10
[15:12]	R/W	0	pin mux select bits for BOOT_11
[19:16]	R/W	0	pin mux select bits for BOOT_12
[23:20]	R/W	0	pin mux select bits for BOOT_13
[27:24]	R/W	0	pin mux select bits for BOOT_14
[31:28]	R/W	0	pin mux select bits for BOOT_15

#### PERIPHS\_PIN\_MUX\_2 0xb2

Reserved.

#### PERIPHS\_PIN\_MUX\_3 0xb3

Bit(s)	R/W	Default	Description
[3:0]	R/W	0	pin mux select bits for GPIOX_0
[7:4]	R/W	0	pin mux select bits for GPIOX_1
[11:8]	R/W	0	pin mux select bits for GPIOX_2
[15:12]	R/W	0	pin mux select bits for GPIOX_3
[19:16]	R/W	0	pin mux select bits for GPIOX_4

[23:20]	R/W	0	pin mux select bits for GPIOX_5
[27:24]	R/W	0	pin mux select bits for GPIOX_6
[31:28]	R/W	0	pin mux select bits for GPIOX_7

**PERIPHS\_PIN\_MUX\_4 0xb4**

Bit(s)	R/W	Default	Description
[3:0]	R/W	0	pin mux select bits for GPIOX_8
[7:4]	R/W	0	pin mux select bits for GPIOX_9
[11:8]	R/W	0	pin mux select bits for GPIOX_10
[15:12]	R/W	0	pin mux select bits for GPIOX_11
[19:16]	R/W	0	pin mux select bits for GPIOX_12
[23:20]	R/W	0	pin mux select bits for GPIOX_13
[27:24]	R/W	0	pin mux select bits for GPIOX_14
[31:28]	R/W	0	pin mux select bits for GPIOX_15

**PERIPHS\_PIN\_MUX\_5 0xb5**

Bit(s)	R/W	Default	Description
[3:0]	R/W	0	pin mux select bits for GPIOX_16
[7:4]	R/W	0	pin mux select bits for GPIOX_17
[11:8]	R/W	0	pin mux select bits for GPIOX_18
[15:12]	R/W	0	pin mux select bits for GPIOX_19

**PERIPHS\_PIN\_MUX\_6 0xb6**

Bit(s)	R/W	Default	Description
[3:0]	R/W	0	pin mux select bits for GPIOZ_0
[7:4]	R/W	0	pin mux select bits for GPIOZ_1
[11:8]	R/W	0	pin mux select bits for GPIOZ_2
[15:12]	R/W	0	pin mux select bits for GPIOZ_3
[19:16]	R/W	0	pin mux select bits for GPIOZ_4
[23:20]	R/W	0	pin mux select bits for GPIOZ_5
[27:24]	R/W	0	pin mux select bits for GPIOZ_6
[31:28]	R/W	0	pin mux select bits for GPIOZ_7

**PERIPHS\_PIN\_MUX\_7 0xb7**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
[3:0]	R/W	0	pin mux select bits for GPIOZ_8

[23:20]	R/W	0	pin mux select bits for GPIOA_13
[27:24]	R/W	0	pin mux select bits for GPIOA_14
[31:28]	R/W	0	pin mux select bits for GPIOA_15

**PERIPHS\_PIN\_MUX\_F 0xbf**

Reserved.

**8.9.3.2 Pad pull-up/down Direction**

The I/O pads contain both a pull-up and a pull-down. If a bit is set to 1 in the registers below, then the pull-up is enabled. If a bit is set to 0, then the pull-down is enabled.

NOTE: There are separate pull-up “enables” that must also be set to 1 for the pull-up/down direction to function. If an “enable” is set to 0, then the pull-up/down feature is disabled, and the bits below are ignored (on a per pad basis).

#### **PAD\_PULL\_UP\_REG0 0x3a**

Bit(s)	R/W	Default	Description
31~16	R/W	0xcfff	Unused
15~0	R/W		Boot[15:0] 1 = pull up. 0 = pull down

#### **PAD\_PULL\_UP\_REG1 0x3b**

Bit(s)	R/W	Default	Description
31:7	R/W	0xff	Unused
6~0	R/W		gpioC[6:0] 1 = pull up. 0 = pull down

#### **PAD\_PULL\_UP\_REG2 0x3c**

Bit(s)	R/W	Default	Description
31~20	R/W	0x5ffff	Reserved
19~0	R/W		gpioX[19:0] 1 = pull up. 0 = pull down

#### **PAD\_PULL\_UP\_REG3 0x3d**

Bit(s)	R/W	Default	Description
31~8	R/W	0x10f	Reserved
7~4	R/W		gpioH[7:4] 1 = pull up. 0 = pull down
3~0	R/W		Reserved

#### **PAD\_PULL\_UP\_REG4 0x3e**

Bit(s)	R/W	Default	Description
31~14	R/W	0xc1ff	Unused
13~0	R/W		gpioZ[13:0] 1 = pull up. 0 = pull down

#### **PAD\_PULL\_UP\_REG5 0x3f**

Bit(s)	R/W	Default	Description
31~16	R/W	0xc000	Unused
15~0	R/W		gpioA[15:0] 1 = pull up. 0 = pull down

#### **8.9.3.3 Pad Pull-Up/Down Enables**

Each I/O pad has a selectable pull-up or pull-down resistor. For the pull-up direction (up or down) to be operational, the appropriate bit below must be set in order to enable the pull-up/down function.

**PAD\_PULL\_UP\_EN\_REG0 0x48**

Bit(s)	R/W	Default	Description
31~16	R/W	0xffff	Unused
15~0	R/W		boot[15:0] pullup-enable: 1 = pullup or pull-down enabled. 0 = no-pull-up or pull-down

**PAD\_PULL\_UP\_EN\_REG1 0x49**

Bit(s)	R/W	Default	Description
31~7	R/W	0xff	Unused
6~0	R/W		gpioC[6:0] pullup-enable: 1 = pullup or pull-down enabled. 0 = no-pull-up or pull-down

**PAD\_PULL\_UP\_EN\_REG2 0x4a**

Bit(s)	R/W	Default	Description
31~20	R/W	0x7ffff	Reserved
19~0	R/W		gpioX[19:0] pullup-enable: 1 = pullup or pull-down enabled. 0 = no-pull-up or pull-down

**PAD\_PULL\_UP\_EN\_REG3 0x4b**

Bit(s)	R/W	Default	Description
31~8	R/W	0x1ff	reserved
7~4	R/W		gpioH[7:4] pullup-enable: 1 = pullup or pull-down enabled. 0 = no-pull-up or pull-down
3~0	R/W		reserved

**PAD\_PULL\_UP\_EN\_REG4 0x4c**

Bit(s)	R/W	Default	Description
31~14	R/W	0x3fff	reserved
13~0	R/W		gpioZ[13:0] pullup-enable: 1 = pullup or pull-down enabled. 0 = no-pull-up or pull-down

**PAD\_PULL\_UP\_EN\_REG5 0x4d**

Bit(s)	R/W	Default	Description
31~16	R/W	0xffff	reserved
15~0	R/W		gpioA[15:0] pullup-enable: 1 = pullup or pull-down enabled. 0 = no-pull-up or pull-down

### 8.9.3.4 PREG\_PAD\_GPIO\_I Registers

**PREG\_PAD\_GPIO0\_I Registers      0x12**

[31:30]	R/W		GPIOA_15 select

### 8.9.3.8 GPIOAO Registers

#### AO\_GPIO\_I 0x0a

Always On GPIO Input levels

Bit(s)	R/W	Default	Description
31	R	0	TEST_N input level
18:16	R	0	INPUT_LEVELS: These bits correspond to the INPUT levels on the gpioE[2:0] pins
11:0	R	0	INPUT_LEVELS: These bits correspond to the INPUT levels on the gpioAO[11:0] pins

#### AO\_GPIO\_O0x0d

Always On GPIO controls.

NOTE: This register is NOT reset during a watchdog event.

Bit(s)	R/W	Default	Description
31	R/W	0xffffffff	TEST_N_OUTPUT_LEVEL: This bit controls the output level of the test_n pin when TEST_N_GPIO_EN_N is set to 0.
18:16	R/W		OUTPUT_LEVEL: These bits correspond to the output levels on the gpioE[2:0] pins when in GPIO mode.
11:0	R/W		OUTPUT_LEVEL: These bits correspond to the output levels on the gpioAO[11:0] pins when in GPIO mode.

#### AO\_RTI\_PINMUX\_REG0 0x05

Bit(s)	R/W	Default	Description
31:28	R/W	0	gpioAO_7 select

27:24	R/W	0	gpioAO_6 select
23:20	R/W	0	gpioAO_5 select
19:16	R/W	0	gpioAO_4 select
15:12	R/W	0	gpioAO_3 select
11:8	R/W	0	gpioAO_2 select
7:4	R/W	0	gpioAO_1 select
3:0	R/W	0	gpioAO_0 select

**AO\_RTI\_PINMUX\_REG1 0x06**

Bit(s)	R/W	Default	Description
31:28	R/W	0	gpioAO TEST_N
27:24	R/W	0	gpioE_2 select
[23:20]	R/W	0	gpioE_1 select
[19:16]	R/W	0	gpioE_0 select
[15:12]	R/W	0	gpioAO_11 select
[11:8]	R/W	0	gpioAO_10 select
[7:4]	R/W	0	gpioAO_9 select
[3:0]	R/W	0	gpioAO_8 select

**AO\_GPIO\_O\_EN\_N 0x09**

Always On GPIO controls.

NOTE: This register is NOT reset during a watchdog event.

Bit(s)	R/W	Default	Description
30-19	R		Reserved
18-16	R/W	0xffffffff	OUTPUT_ENABLE: These bits correspond to the output levels on the gpioE[2:0] pins when in GPIO mode. A '0' sets the gpioE pin to be an output.
15-12	R		Reserved
11-0	R/W		OUTPUT_ENABLE: These bits correspond to the output levels on the gpioAO[11:0] pins when in GPIO mode. A '0' sets the gpioAO pin to be an output.

**AO\_GPIO\_I 0x0a**

Always On GPIO Input levels

Bit(s)	R/W	Default	Description
31	R	0	TEST_N input level

18:16	R	0	INPUT_LEVELS: These bits correspond to the INPUT levels on the gpioE[2:0] pins
11-0	R	0	INPUT_LEVELS: These bits correspond to the INPUT levels on the gpioAO[11:0] pins

**AO\_RTI\_PULL\_UP\_REG 0x0b**

Bit(s)	R/W	Default	Description
31	R/W	0x8000005ab	TEST_N pull up/down. 1 = pull-up 0 = pull-down
18-16	R/W		gpioE[2:0] pull-up/down. 1 = pull-up 0 = pull-down
11-0	R/W		gpioAO[11:0] pull up/down. 1 = pull-up 0 = pull-down

**AO\_RTI\_PULL\_UP\_EN\_REG 0x0c**

Always On GPIO controls.

NOTE: This register is NOT reset during a watchdog event.

Bit(s)	R/W	Default	Description
31	R/W	0x80040fff	TEST_N pull-up/down enable. 1 = pull-up/down enable, 0 = pull-up/down disable
18-16	R/W		gpioE[2:0] pull-up/down enable. 1 = pull-up/down enable, 0 = pull-up/down disable
11-0	R/W		gpioAO[11:0] pull-up/down enable. 1 = pull-up/down enable, 0 = pull-up/down disable

**AO\_PAD\_DS\_A 0x07**

Pad ds0/ds1

Bit(s)	R/W	Default	Description
23:22	R/W	0aaaaaaaaaa	gpioAO_11{ds1 ds0}
21:20	R/W		gpioAO_10{ds1 ds0}
19:18	R/W		gpioAO_9{ds1 ds0}
17:16	R/W		gpioAO_8{ds1 ds0}
15:14	R/W		gpioAO_7{ds1 ds0}
13:12	R/W		gpioAO_6{ds1 ds0}
11:10	R/W		gpioAO_5{ds1 ds0}
9:8	R/W		gpioAO_4{ds1 ds0}
7:6	R/W		gpioAO_3{ds1 ds0}
5:4	R/W		gpioAO_2{ds1 ds0}
3:2	R/W		gpioAO_1{ds1 ds0}
1:0	R/W		gpioAO_0 {ds1 ds0}

**AO\_PAD\_DS\_B 0x08**

Pad ds0/ds1

Bit(s)	R/W	Default	Description
31:30	R/W	0aaaaaaaaa	reset_n {ds1, ds0}
29:28	R/W		test_n {ds1, ds0}
5:4	R/W		gpioE_2 {ds1 ds0}
3:2	R/W		gpioE_1 {ds1 ds0}
1:0	R/W		gpioE_0 {ds1 ds0}

**AO\_PINMUX\_LOCK 0x17**

Bit(s)	R/W	Default	Description
31	R/W	0	1: generate error when write to each locked register;
7	R/W	0	lock ao gpio_o
6	R/W	0	lock ao gpio pull en
5	R/W	0	lock ao gpio pull up
4	R/W	0	lock ao gpio_o_en
1	R/W	0	lock ao pin_mux_reg1
0	R/W	0	lock ao pin_mux_reg0

## 8.10 Interrupt Control

### 8.10.1 Overview

Generic Interrupt Controller (GIC) is a centralized resource that supports and manages interrupts in a system. For more details about GIC, please refer to the ARM GIC Architecture Specification V2.0.

### 8.10.2 Interrupt Source

There are 10 interrupts that are routed to all CPUs (A53/SCP..). The tables below outline the interrupts associated with each interrupt group:

There are 224 interrupt sources in the chip. All of the interrupts are connected to the integrated GIC in Cortex-A53 while the AO-CPU see a sub-set of the interrupts. The control Bits of AO-CPU interrupt are listed in the following table.

**Table 8-33 EE Interrupt Source**

A53 GIC Bit	Interrupt Source	Description
255	pcie_A_7	
254	pcie_A_6	

A53 GIC Bit	Interrupt Source	Description
253	pcie_A_5	
252	pcie_A_4	
251	pcie_A_3	
250	pcie_A_2	
249	pcie_A_1	
248	pcie_A_0

## GPIO Interrupt

There are 10 GPIO interrupts, SCP can respond to all of them, while A53 can respond to 8 of them (listed in Table 8-34, GIC bit 96~103). The figure below outline the interrupts associated with each interrupt group:

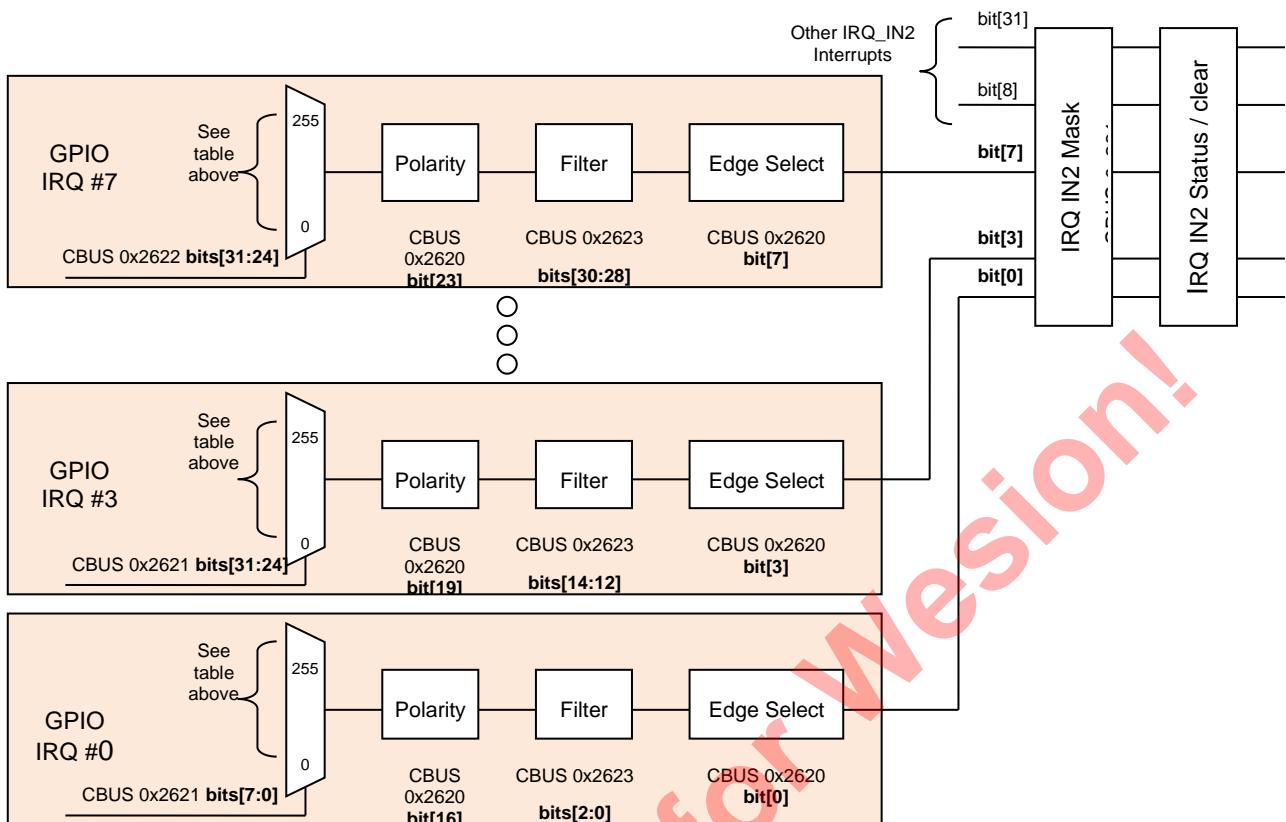

**Figure 8-26 A311D Interrupt**

**Table 8-34 GPIO Interrupt Sources**

Input Mux Location CBUS registers 0x2621 and 0x2622	Description
[223:100]	Undefined(no interrupt)
[99:97]	gpioE[2:0]
[96:77]	gpioX[19:0]
[76:61]	gpioA[15:0]
[60:53]	gpioC[7:0]
[52:37]	Boot[15:0]
[36:28]	gpioH[8:0]
[27:12]	gpioZ[15:0]
[11:0]	gpioAO[11:0]

The diagram below illustrates the path a GPIO takes to become an interrupt. The eight GPIO interrupts respond to the MASK, STATUS and STATUS/CLEAR registers just like any other interrupt in the chip. The difference for the GPIO interrupts is that they can be filtered and conditioned.

**Figure 8-27 GPIO Interrupt Path**

**NOTE:** The input for the GPIO interrupt module (the input into the 256:1 mux) comes directly from the I/O pad of the chip. Therefore, if a pad (say gpioA\_11) is configured as a UART TX pin, then in theory, the UART TX pin can be a GPIO interrupt since the TX pin will drive gpioA\_11 which in turn can drive the GPIO interrupt module.

### 8.10.3 Register Description

Each register final address = 0xffd00000 + address \* 4

#### AO\_IRQ\_GPIO\_REG 0x21

Interrupt masking and FIQ select

Bit(s)	R/W	Default	Description
31-20	R	0	Unused
19	R/W	0	GPIO_1_IRQ_EDGE: If this bit is 1, then GPIO_1_IRQ generates an interrupt on the rising (or falling edge if GPIO_1_POL is set) of the selected interrupt.
18	R/W	0	GPIO_0_IRQ_EDGE: If this bit is 1, then GPIO_0_IRQ generates an interrupt on the rising (or falling edge if GPIO_0_POL is set) of the selected interrupt.
17	R/W	0	GPIO_1_POL: This bit controls the polarity of the GPIO muxed into the GPIO_1 interrupt filter module
16	R/W	0	GPIO_0_POL: This bit controls the polarity of the GPIO muxed into the GPIO_0 interrupt filter module

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R/W	0	GPIO_1_FILTER_USE_CLK: Setting this bit to 1 connects the input filter to the system clock (the clock used by the media CPU). If this bit is 0, then the filter uses a 125nS clock to filter the GPIO_1 input
14-12	R/W	0	GPIO_1_FILTER_SEL: 0 = no filter, 1 = max filter (about 2.6uS)
11	R/W	0	GPIO_0_FILTER_USE_CLK
10-8	R/W	0	GPIO_0_FILTER_SEL: 0 = no filter, 1 = max filter (about 2.6uS)
7-4	R/W	0	GPIO_1_INPUT_SEL: These bits select which gpioAO[11:0] pin is connected to the GPIO_1 interrupt filter module.
3-0	R/W	0	GPIO_0_INPUT_SEL: These bits select which gpioAO[11:0] pin is connected to the GPIO_1 interrupt filter module.

### GPIO Interrupt EDGE and Polarity 0x3c20

This register controls the polarity of the GPIO interrupts and whether or not the interrupts are level or edge triggered. There are 8 GPIO interrupts. These 8 GPIO interrupts can be assigned to any one of up to 256 pins on the chip.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R	0	unused
23			GPIO_POLARITY_PATH_7: If a bit in this field is 1, then the GPIO signal for GPIO interrupt path 7 is inverted.
22			GPIO_POLARITY_PATH_6:
21			GPIO_POLARITY_PATH_5:
20			GPIO_POLARITY_PATH_4:
19			GPIO_POLARITY_PATH_3:
18			GPIO_POLARITY_PATH_2:
17			GPIO_POLARITY_PATH_1:
16	R/W	0	GPIO_POLARITY_PATH_0:
15-8	R	0	Unused
7	R/W		GPIO_EDGE_SEL_PATH_7: If a bit is set to 1, then the GPIO interrupt for GPIO path 7 is configured to be an edge generated interrupt. If the polarity (above) is 0, then the interrupt is generated on the rising edge. If the polarity is 1, then the interrupt is generated on the falling edge of the GPIO. If a bit in this field is 0, then the GPIO is a level interrupt.
6	R/W		GPIO_EDGE_SEL_PATH_6
5	R/W		GPIO_EDGE_SEL_PATH_5
4	R/W		GPIO_EDGE_SEL_PATH_4
3	R/W		GPIO_EDGE_SEL_PATH_3

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
2	R/W		GPIO_EDGE_SEL_PATH_2
1	R/W		GPIO_EDGE_SEL_PATH_1
0	R/W	0	GPIO_EDGE_SEL_PATH_0

**GPIO 0 ~ 3 Pin Select 0x3c21**

Each GPIO interrupt can select from any number of up to 256 GPIO pins on the chip. The Bits below control the pin selection for GPIO interrupts 0 ~3.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	GPIO_PIN_SEL3: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 3
23-16	R/W	0	GPIO_PIN_SEL2: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 2
15-8	R/W	0	GPIO_PIN_SEL1: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 1
7-0	R/W	0	GPIO_PIN_SEL0: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 0

**GPIO 4 ~ 7 Pin Select 0x3c22**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	GPIO_PIN_SEL7: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 7
23-16	R/W	0	GPIO_PIN_SEL6: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 6
15-8	R/W	0	GPIO_PIN_SEL5: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 5
7-0	R/W	0	GPIO_PIN_SEL4: This value select which of up to 256 pins on the chip can be mapped to GPIO interrupt 4

**GPIO Filter Select (interrupts 0~7) 0x3c23**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	unused
30-28	R/W	0	FILTER_SEL7: (see FILTER_SEL0)
27	R/W	0	Unused
26-24	R/W	0	FILTER_SEL6: (see FILTER_SEL0)

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23	R/W	0	Unused
22-20	R/W	0	FILTER_SEL5: (see FILTER_SEL0)
19	R/W	0	Unused
18-16	R/W	0	FILTER_SEL4: (see FILTER_SEL0)
15	R/W	0	Unused
14-12	R/W	0	FILTER_SEL3: (see FILTER_SEL0)
11	R/W	0	Unused
10-8	R/W	0	FILTER_SEL2: (see FILTER_SEL0)
7	R/W	0	Unused
6-4	R/W	0	FILTER_SEL1: (see FILTER_SEL0)
3	R/W	0	unused
2-0	R/W	0	FILTER_SEL0: This value sets the filter selection for GPIO interrupt 0. A value of 0 = no filtering. A value of 7 corresponds to 7 x 3 x (111nS) of filtering.

## 8.11 TIMER

### 8.11.1 Overview

The SOC contains 15 general purpose timers and 2 watchdog timers.

### 8.11.2 General-Purpose Timer

The SOC contains a number of general-purpose timers that can be used as general counters or interrupt generators. Each counter (except TIMER E) can be configured as a periodic counter (for generating periodic interrupts) or a simple count-down and stop counter. Additionally, the timers have a programmable count rate ranging from 1uS to 1mS. The table below outlines the general-purpose timers available in the chip.

**Table 8-35 General-Purpose Timer**

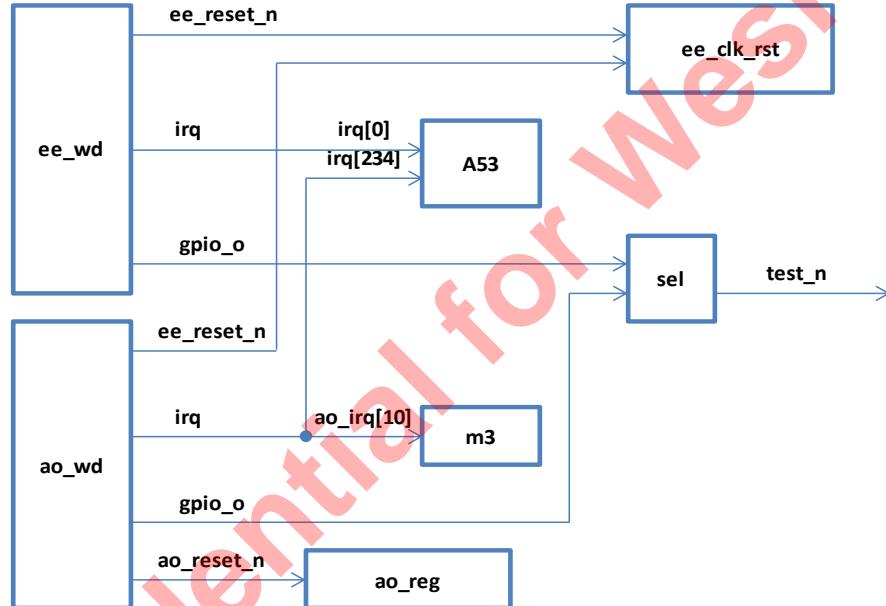

Timer	Timebase Options	Counter size	Comment
Timer A	1uS, 10uS, 100uS, 1mS	16-bits	The 16-bit counter allows the timer to generate interrupts as infrequent as every 65.535 Seconds
Timer B	1uS, 10uS, 100uS, 1mS	16-bits	
Timer C	1uS, 10uS, 100uS, 1mS	16-bits	
Timer D	1uS, 10uS, 100uS, 1mS	16-bits	
Timer E	System clock, 1uS, 10uS, 100uS, 1mS	64-bits	Doesn't generate an interrupt. This is a count up counter that counts from 0 to 0xFFFFFFFF. The counter can be written at any time to reset the value to 0.
Timer F	1uS, 10uS, 100uS, 1mS	16-bits	
Timer G	1uS, 10uS, 100uS, 1mS	16-bits	
Timer H	1uS, 10uS, 100uS, 1mS	16-bits	
Timer I	1uS, 10uS, 100uS, 1mS	16-bits	
Timer A-AO	System clock, 1uS, 10uS, 100uS	32-bits	Used in the Always On domain to generate interrupts for the AO-CPU
Timer B-AO	System clock, 1uS, 10uS, 100uS	32-bits	Used in the Always On domain to generate interrupts for the AO-CPU
Timer C-AO	System clock, 1uS, 10uS, 100uS	32-bits	Used in the Always On domain to generate interrupts for the AO-CPU
Timer E-AO	System clock	64-bits	This Always On counter doesn't generate an interrupt. Instead it simply counts up from 0 to 0xFFFFFFFF. The counter can be written at any time to reset the value to 0.

Timer	Timebase Options	Counter size	Comment
Timer F-AO	System clock	64-bits	This Always On counter doesn't generate an interrupt. Instead it simply counts up from 0 to 0xFFFFFFFF. The counter can be written at any time to reset the value to 0.
Timer G-AO	System clock	64-bits	This Always On counter doesn't generate an interrupt. Instead it simply counts up from 0 to 0xFFFFFFFF. The counter can be written at any time to reset the value to 0.

### 8.11.3 Watchdog Timer

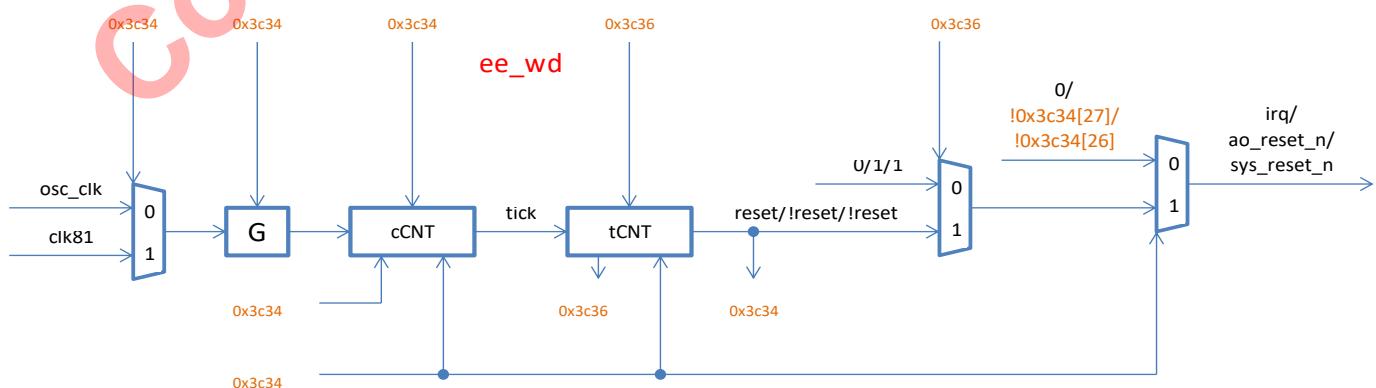

There are also two watchdog timers, one in AO and the other in EE domain, illustrated as following:

Figure 8-28 Watchdog Timer

AO domain watchdog timer and EE domain watchdog timer have the same design, as illustrated in the following figure:

Figure 8-29 EE domain Watchdog Timer Design

The AO Domain watchdog timer is driven from the system clock (typically 157Mhz). It is a 16-bit counter that is periodically reset by either the AO CPU or the System CPU (A53). This AO-watchdog timer can be used to generate an interrupt of the AO domain. Additionally, the AO-watchdog timer can be used to “enable” a delay generator that can toggle a GPIO pin (currently the TEST\_n I/O pad). The “delay generator” allows an interrupt to first be acknowledged by the AO-CPU before the TEST\_N pad is toggled. The “delay generator” is programmable from 1 to 65535 system clocks (typically 417uS).

It should be noted that the AO watchdog timer can also be used to reset the AO domain but this feature is only used when operating in a suspend mode (only the AO-domain is powered). As long as the system periodically resets the AO-watchdog timer the WD\_GPIO\_CNT (delay generator) will not be enabled and the I/O pad will not toggle.

**NOTE:**

*The maximum delay between two AO-watchdog periodic resets is about 100mS (assuming a 157Mhz system clock).*

The EE Domain watchdog timer is driven by the 24Mhz crystal clock and can be used to generate an interrupt to the system CPU (the A53) or optionally, the watchdog timer can completely reset the chip (causing a cold boot). There are a few registers that are not affected by watchdog timer. These registers are only reset by the external RESET\_n I/O pad and can be used to store information related to a possible watchdog event. As long as the system CPU periodically resets the EE-watchdog timer, it will never timeout and cause an interrupt or system reset.

**NOTE:**

*The maximum delay between two EE-watchdog periodic resets is about 8.3 Seconds. This time is independent of the system clocks and is driven by the external 24Mhz crystal.*

### 8.11.4 Register Description

Each register final address = 0xffd00000 + address \* 4

#### ISA\_TIMER\_MUX 0x3c50

Bit(s)	R/W	Default	Description
31-20	R	0	unused
19	R/W	1	TIMERD_EN: Set to 1 to enable Timer D
18	R/W	1	TIMERC_EN: Set to 1 to enable Timer C
17	R/W	1	TIMERB_EN: Set to 1 to enable Timer B
16	R/W	1	TIMERA_EN: Set to 1 to enable Timer A
15	R/W	0	TIMERD_MODE: If This bit is set to 1, then timerD is a periodic . 0 = one-shot timer
14	R/W	0	TIMERC_MODE: If This bit is set to 1, then timerC is a periodic . 0 = one-shot timer
13	R/W	1	TIMERB_MODE: If This bit is set to 1, then timerB is a periodic . 0 = one-shot timer
12	R/W	1	TIMERA_MODE: If This bit is set to 1, then timerA is a periodic . 0 = one-shot timer
11	R	0	unused

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10-8	R/W	0x1	TIMER E input clock selection: 000: System clock 001: 1uS Timebase resolution 010: 10uS Timebase resolution 011: 100uS Timebase resolution 100: 1mS timebase  NOTE: The mux selection for Timer E is different from timer A, B, C and D
7-6	R/W	0x0	TIMER D input clock selection: See TIMER A below
5-4	R/W	0x0	TIMER C input clock selection: See TIMER A below
2-3	R/W	0x0	TIMER B input clock selection: See TIMER A below
1-0	R/W	0x0	TIMER A Input clock selection: These Bits select the input timebase for the counters for TimerA 00: 1uS Timebase resolution 01: 10uS Timebase resolution 10: 100uS Timebase resolution 11: 1mS Timebase resolution

**ISA\_TIMERA 0x3c51**

Timer A is a 16 bit count DOWN counter driven by the clock selected in register 0x01000530. TIMER A will count down from some value to zero, generate an interrupt and then re-load the original start count value. This timer can be used to generate a periodic interrupt (e.g. interrupt every 22 uS).

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	-	Current Count value
15-0	R/W	0x0	Starting count value. Write this value to start TIMER A.

**ISA\_TIMERB 0x3c52**

Timer B is just like Timer A.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	-	Current Count value
15-0	R/W	0x0	Starting count value. Write this value to start TIMER B

**ISA\_TIMERC 0x3c53**

Timer C is just like Timer A.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	unused

15-0	R/W	0x0	Starting count value. Write this value to start TIMER C
------	-----	-----	---

**ISA\_TIMERD 0x3c54**

Timer D is identical to Timer A.

Bit(s)	R/W	Default	Description
31-16	R	0	unused
15-0	R/W	0x0	Starting count value. Write this value to start TIMER D

**ISA\_TIMERE 0x3c62**

Timer E is simply a 32-bit counter that increments at a rate set by register 0x2650. To reset the counter to zero, simply write this register with any value. The value below is a read-only value that reflects the current count of the internal counter. This register can be used by software to simply provide a polling delay loop based on a programmable timebase.

Bit(s)	R/W	Default	Description
31-0	R	-	Current value of Timer E. Write this register with any value to clear the counter.

**ISA\_TIMERE\_HI 0x3c63**

Bit(s)	R/W	Default	Description
31-0	R	-	Current value of Timer E[63:32]. Need read ISA_TIMERE first.

**ISA\_TIMER\_MUX1 0x3c64**

Bit(s)	R/W	Default	Description
31-20	R	0	unused
19	R/W	1	TIMERI_EN: Set to 1 to enable Timer I
18	R/W	1	TIMERH_EN: Set to 1 to enable Timer H
17	R/W	1	TIMERG_EN: Set to 1 to enable Timer G
16	R/W	1	TIMERF_EN: Set to 1 to enable Timer F
15	R/W	0	TIMERI_MODE: If This bit is set to 1, then timerI is a periodic . 0 = one-shot timer
14	R/W	0	TIMERH_MODE: If This bit is set to 1, then timerH is a periodic . 0 = one-shot timer
13	R/W	1	TIMERG_MODE: If This bit is set to 1, then timerG is a periodic. 0 = one-shot timer
12	R/W	1	TIMERF_MODE: If This bit is set to 1, then timerF is a periodic. 0 = one-shot timer
11	R	0	unused

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10-8	R/W	0x1	TIMER J input clock selection: 000: System clock 001: 1uS Timebase resolution 010: 10uS Timebase resolution 011: 100uS Timebase resolution 100: 1mS timebase  NOTE: The mux selection for Timer J is different from timer F, G, H and I
7-6	R/W	0x0	TIMER I input clock selection: See TIMER F below
5-4	R/W	0x0	TIMER H input clock selection: See TIMER F below
2-3	R/W	0x0	TIMER G input clock selection: See TIMER F below
1-0	R/W	0x0	TIMER F Input clock selection: These Bits select the input timebase for the counters for TimerF 00: 1uS Timebase resolution 01: 10uS Timebase resolution 10: 100uS Timebase resolution 11: 1mS Timebase resolution

**ISA\_TIMERF 0x3c65**

Timer F is a 16 bit count DOWN counter driven by the clock selected in register 0x01000530. TIMER A will count down from some value to zero, generate an interrupt and then re-load the original start count value. This timer can be used to generate a periodic interrupt (e.g. interrupt every 22 uS).

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	-	Current Count value
15-0	R/W	0x0	Starting count value. Write this value to start TIMER A.

**ISA\_TIMERG 0x3c66**

Timer G is just like Timer F.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	-	Current Count value
15-0	R/W	0x0	Starting count value. Write this value to start TIMER B

**ISA\_TIMER\_H 0x3c67**

Timer H is just like Timer F.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	unused
15-0	R/W	0x0	Starting count value. Write this value to start TIMER C

**ISA\_TIMER\_I 0x3c68**

Timer I is just like Timer F.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	unused
15-0	R/W	0x0	Starting count value. Write this value to start TIMER I

**WATCHDOG\_CNTL 0x3c34**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0	Watchdog_reset
30-28	R/W	0	Reserved
27	R/W	0	Ao_reset_n_now, if watchdog_en =0, output ao_reset_n = ! ao_reset_n_now
26	R/W	0	Sys_reset_n_now, if watch_dog_en = 0, output sys_reset_n = !sys_reset_n_now.
25	R/W	0	Clk_div_en: 0: no tick; 1: generate tick;
24	R/W	0	Clk_en: 0: no clk; 1: clk work;
23	R/W	0	Interrupt_en: 0: no irq out; 1: irq = watchdog_reset;
22	R/W	0	Ao_reset_n_en: 0: output ao_reset_n = 1; 1: output ao_reset_n = ! watchdog_reset;
21	R/W	0	Sys_reset_n_en 0: output sys_reset_n = 1; 1: output sys_reset_n = ! watchdog_reset;
20	R/W	0	Reserved
19	R/W	0	Clk_sel: 0:osc_clk; 1:clk_81
18	R/W	0	Watchdog_en 0: no watchdog reset 1: gen watchdog reset
17-0	R/W	0	Clk_div_tcnt, when clk_div_en is 1, generate a tick each tcnt clock

**WATCHDOG\_CNTL1 0x3c35**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-18	R	0	Reserved
17	R/W	0	Gpio_pulse 0:level reset 1:pulse reset
16	R/W	0	Gpio_polarity 0: 1 is reset; 1: 0 is reset.
15-0	R/W	0	Gpio_pulse_tcnt If gpio_pulse is 1, level reset will hold tcnt clock.

**WATCHDOG\_TCNT 0x3c36**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	The cnt of tick.
15-0	R/W	5000	If watchdog_en is 1, when tick cnt reached "5000", generate watchdog_reset.

**WATCHDOG\_RESET0x3c37**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	W	0	When write any value(include 0), watchdog module will be reset.

Below registers have the same base address: 0xFF800000, register address: 0xFF800000 + offset \* 4, same for secure and non-secure access

**AO\_TIMER\_CTRL 0xf0**

Timer controls.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-7	R/W	0	Unused
6-5	R/W	0	TIMERE_CLK_MUX: 00 = Timer E clock = Media CPU clock 01 = Timer E clock = 1uS ticks 10 = Timer E clock = 10uS ticks 11 = Timer E clock = 100uS ticks
4	R/W	0	TIMER_E_EN
3	R/W	0	TIMER_A_EN
2	R/W	0	TIMER_A_MODE: 1 = periodic, 0 = one-shot

1-0	R/W	0	TIMERA_CLK_MUX: 00 = TimerA clock = Media CPU clock 01 = Timer A clock = 1uS ticks 10 = Timer A clock = 10uS ticks 11 = Timer A clock = 100uS ticks
-----	-----	---	---

**AO\_TIMER\_SEC\_SCP\_CTRL 0xf1**

Timer controls.

Bit(s)	R/W	Default	Description
31-7	R/W	0	Unused
6-5	R/W	0	TIMER F_CLK_MUX: 00 = Timer F clock = Media CPU clock 01 = Timer F clock = 1uS ticks 10 = Timer F clock = 10uS ticks 11 = Timer F clock = 100uS ticks
4	R/W	0	TIMER_F_EN
3	R/W	0	TIMER_B_EN
2	R/W	0	TIMER_B_MODE: 1 = periodic, 0 = one-shot
1-0	R/W	0	TIMERB_CLK_MUX: 00 = TimerB clock = Media CPU clock 01 = Timer B clock = 1uS ticks 10 = Timer B clock = 10uS ticks 11 = Timer B clock = 100uS ticks

**AO\_TIMER\_SEC\_SP\_CTRL 0xf2**

Timer controls.

Bit(s)	R/W	Default	Description
31-7	R/W	0	Unused
6-5	R/W	0	TIMER G_CLK_MUX: 00 = Timer G clock = Media CPU clock 01 = Timer G clock = 1uS ticks 10 = Timer G clock = 10uS ticks 11 = Timer G clock = 100uS ticks
4	R/W	0	TIMER_G_EN
3	R/W	0	TIMER_C_EN
2	R/W	0	TIMER_C_MODE: 1 = periodic, 0 = one-shot

			TIMERC_CLK_MUX: 00 = Timer C clock = Media CPU clock 01 = Timer C clock = 1uS ticks 10 = Timer C clock = 10uS ticks 11 = Timer C clock = 100uS ticks
1-0	R/W	0	

**AO\_TIMERA\_REG 0xf3**

Timer A starts at a non-zero value and decrements to 0. When timer A reaches a count of 0 it will re-load with the TIMER\_A\_TCNT value.

Bit(s)	R/W	Default	Description
31-0	R/W	0	timer A set value; if mode = 0, will clr timer to 0;

**AO\_TIMERA\_CUR\_REG 0xf4**

Bit(s)	R/W	Default	Description
31-0	R	0	TIMER A current count.

**AO\_TIMERB\_REG 0xf5**

Bit(s)	R/W	Default	Description
31-0	R/W	0	timer B set value; if mode = 0, will clr timer to 0;

**AO\_TIMERB\_CUR\_REG 0xf6**

Bit(s)	R/W	Default	Description
31-0	R	0	TIMER B current count.

**AO\_TIMERC\_REG 0xf7**

Bit(s)	R/W	Default	Description
31-0	R/W	0	timer C set value; if mode = 0, will clr timer to 0;

**AO\_TIMERC\_CUR\_REG 0xf8**

Bit(s)	R/W	Default	Description
31-0	R	0	TIMER C current count.

**AO\_TIMERE\_REG 0xf9**

If this register is written (with any value), then Timer E is reset to 0. Immediately after being cleared, timer E will start incrementing at a clock rate equal to the clock used for the Media CPU..

Bit(s)	R/W	Default	Description
31-0	R/W	0	TIMER E current Count[31:0]

**AO\_TIMERE\_HI\_REG 0xfa**

Bit(s)	R/W	Default	Description
31-0	R/W	0	TIMER E current Count[63:32], latched by read timerE[31:0];

**AO\_TIMERF\_REG 0xfb**

If this register is written (with any value), then Timer F is reset to 0. Immediately after being cleared, timer F will start incrementing at a clock rate equal to the clock used for the Media CPU..

Bit(s)	R/W	Default	Description
31-0	R/W	0	TIMER F current Count[31:0]

**AO\_TIMERF\_HI\_REG 0xfc**

Bit(s)	R/W	Default	Description
31-0	R/W	0	TIMER F current Count[63:32], latched by read timerF[31:0];

**AO\_TIMERG\_REG 0xfd**

If this register is written (with any value), then Timer G is reset to 0. Immediately after being cleared, timer G will start incrementing at a clock rate equal to the clock used for the Media CPU..

Bit(s)	R/W	Default	Description
31-0	R/W	0	TIMER G current Count[31:0]

**AO\_TIMERG\_HI\_REG 0xfe**

Bit(s)	R/W	Default	Description
31-0	R/W	0	TIMER G current Count[63:32], latched by read timerG[31:0];

**AO\_WATCHDOG\_CNTL 0x48**

A53/Secure	A53/Non Secure	M3/Secure	M3/Non Secure	Reset by watchdog
R/W	R/W	R/W	R/W	Yes

Bit(s)	R/W	Default	Description
31-28	R	0	unused
27	R/W	0	Ao_reset_n_now
26	R/W	0	Sys_reset_n_now
25	R/W	0	Clk_div_en
24	R/W	1	Clk_en
23	R/W	0	Interrupt_en

22	R/W	0	Ao_reset_n_en
21	R/W	0	Sys_reset_n_en
20	R/W	0	Noused
19	R/W	0	Clk_sel
18	R/W	0	Watchdog_en
17-0	R/W	23999	Clk_div_tcnt

**AO\_WATCHDOG\_CNTL10x49**

A53/Secure	A53/Non Secure	M3/Secure	M3/Non Secure	Reset by watchdog
R/W	R/W	R/W	R/W	Yes

Bit(s)	R/W	Default	Description
31-17	R	0	unused
17	R/W	0	Gpio_pulse
16	R/W	0	Gpio_polarity
15-0	R/W	0	Gpio_pulse_tcnt

**AO\_WATCHDOG\_TCNT 0x4a**

A53/Secure	A53/Non Secure	M3/Secure	M3/Non Secure	Reset by watchdog
R/W	R/W	R/W	R/W	Yes

Bit(s)	R/W	Default	Description
31-16	R	0	Watchdog count read
15-0	R/W	0	Watchdog_count set

**AO\_WATCHDOG\_RESET 0x4b**

A53/Secure	A53/Non Secure	M3/Secure	M3/Non Secure	Reset by watchdog
R/W	R/W	R/W	R/W	Yes

Write any value can reset watchdog.

Bit(s)	R/W	Default	Description
31-0	W	0	Watchdog soft reset

## 8.12 Crypto

### 8.12.1 Overview

The crypto engine is one encrypt/decrypt function accelerator. It supports both encryption/decryption and signature/verification. Crypto engine supports 4 different modes, i.e. A53 secure, A53 non secure, M3 secure and M3 non secure. The crypto engine has special internal DMA controller to transfer data.

It has the following features:

- AES block cipher with 128/192/256 Bits keys, standard 16 bytes block size and streaming ECB, CBC and CTR modes
- DES/TDES block cipher with ECB and CBC modes supporting 64 Bits key for DES and 192 Bits key for 3DES
- Hardware key-ladder operation and DVB-CSA for transport stream encryption
- Built-in hardware True Random Number Generator (TRNG), CRC and SHA-1/SHA-2 engine

### 8.12.2 Key Ladder

The Key Ladder is a series of TDES / AES crypto processes that iterates on different user supplied and OTP keys. The key ladder module uses a single AES / TDES crypto module and iterates using internal storage to hold temporary states.

### 8.12.3 RNG

Functionality the Random Number Generator (RNG) contains two main modules: True Random Number Generator (TRNG) and Deterministic Random Number Generator (DRNG).

True Random Number Generator (TRNG): this TRNG is realized by using metastability and jitter for random bit generation based on four free running ring oscillator

Deterministic Random Number Generator (DRNG): this DRNG, which has 32-bit random number generator, is mainly designed to increase the throughput and do post-processing of the Digital TRNG, which will need hundreds cycles to collect entropy.

### 8.12.4 EFUSE

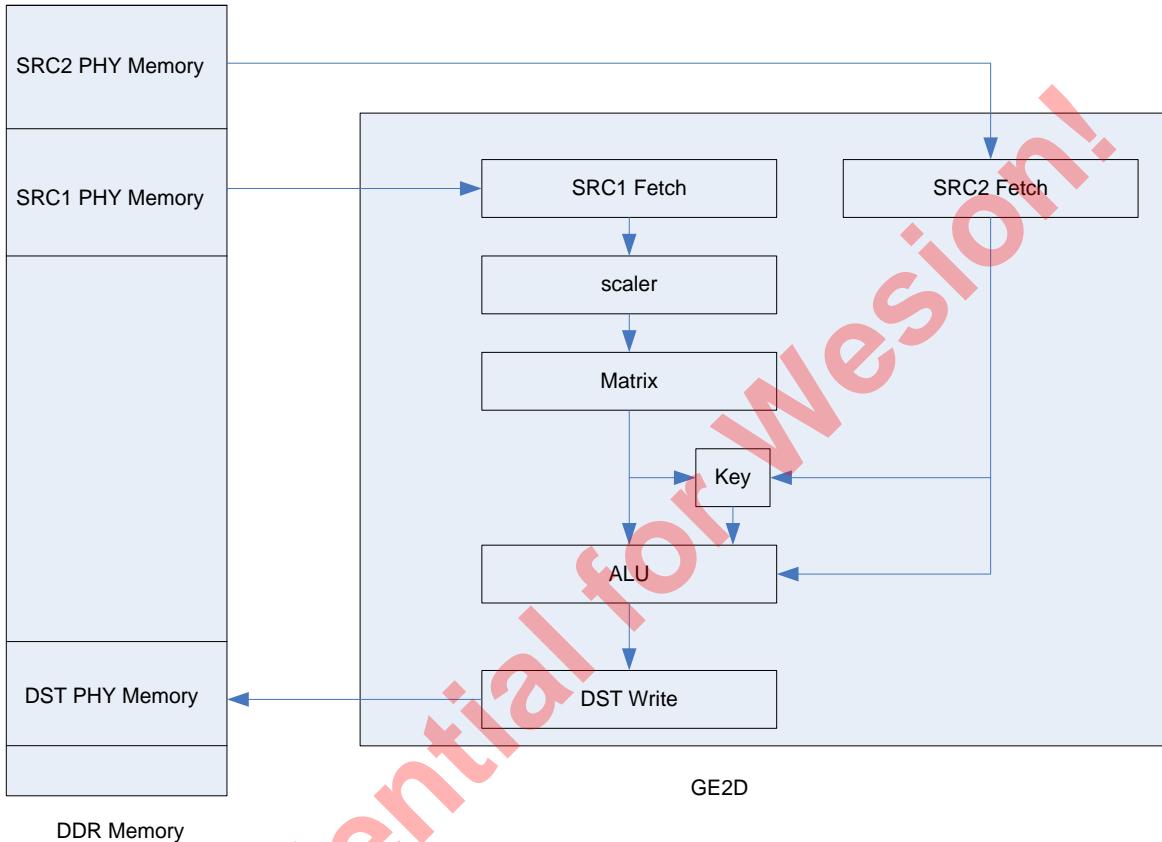

The EFUSE consists of a 4kbit One Time Programmable (OTP) memory that is broken up into 32, 128-bit blocks. Data is always read/written in 128-bit blocks using the APB bus (software) or by the Key-ladder which is integrated with EFUSE block.

## 9. GE2D

### 9.1 Overview

The basic structure of GE2D is shown in Fig below.

**Figure 9-1 GE2D Structure**

### 9.2 Register Description

#### GE2D\_GEN\_CTRL0 0x8A0

Bit(s)	R/W	Default	Description
31	R/W	0	DST_BYTEMASK_ONLY: Applicable only if DST_BITMASK_EN=1.
30	R/W	0	DST_BITMASK_EN: destination bitmask enable. 0: disable; 1: enable.
29	R/W	0	SRC2_KEY_EN: source2 key enable. 0: disable; 1: enable.
28	R/W	0	SRC2_KEY_MODE: source2 key mode.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			0: mask data when match; 1: mask data when unmatch.
27	R/W	0	SRC1_KEY_EN: source1 key enable. 0: disable; 1: enable.
26	R/W	0	SRC1_KEY_MODE: source1 key mode. 0: mask data when match; 1: mask data when unmatch.
25-24	R/W	0	DST1_8B_MODE_SEL: Destination 1's 8-bit mode component selection. 0: Select Y or R; 1: Select Cb or G; 2: Select Cr or B; 3: Select Alpha.
23	R/W	0	DST_CLIP_MODE: 0: Write inside clip window; 1: Write outside clip window.
22-17	R	0	Unused
16-15	R/W	0	SRC2_8B_MODE_SEL: Applicable only when SRC2_FORMAT=0, define the property of the 8-bit output data. 0: The 8-bit output data is for Y or R; 1: The 8-bit output data is for Cb or G; 2: The 8-bit output data is for Cr or B; 3: The 8-bit output data is for Alpha.
14	R/W	0	SRC2_FILL_MODE: When the display window is outside the boundary of the clipping window, this field defines how to fill the area outside the clipping window. 0: Fill with the pixels at the boundary of the clipping window; 1: Fill with the default color defined by register GE2D_SRC2_DEF_COLOR.
13-12	R/W	0	SRC2_PIC_STRUCT: Define how source2 reads the picture stored in DDR memory. 0: Read all lines; 1: Reserved; 2: Read even lines only; 3: Read odd lines only.
11	R/W	0	SRC2_X_YC_RATIO: Source2 x direction yc ratio. 0: 1:1; 1: 2:1.

Bit(s)	R/W	Default	Description
9-7	R	0	Unused
6-5	R/W	0	<p>SRC1_8B_MODE_SEL: Applicable only when SRC1_SEP_EN =0, SRC1_FORMAT=0 and SRC1_LUT_EN=0, define the property of the 8-bit output data.</p> <p>0: the 8-bit output data is for Y or R;      1: the 8-bit output data is for Cb or G;      2: the 8-bit output data is for Cr or B;      3: the 8-bit output data is for Alpha.</p>
4	R/W	0	<p>SRC1_FILL_MODE: When the display window is outside the boundary of the clipping window, this field defines how to fill the area outside the clipping window.</p> <p>0: Fill with the pixels at the boundary of the clipping window;      1: Fill with the default color defined by register GE2D_SRC1_DEF_COLOR.</p>
3	R/W	0	<p>SRC1_LUT_EN: Applicable only when SRC1_SEP_EN =0 and SRC1_FORMAT= 0, define whether to enable 8-bit input data to look up a 32-bit pixel for output.</p> <p>0: Disable;      1: Enable.</p>
2-1	R/W	0	<p>SRC1_PIC_STRUCT: Define how source1 reads the picture stored in DDR memory.</p> <p>0: Read all lines;      1: Reserved;      2: Read even lines only;      3: Read odd lines only.</p>

**GE2D\_GEN\_CTRL1 0x8A1**

Bit(s)	R/W	Default	Description
31	R/W	0	SOFT_RST: If true, reset GE2D.
30	R/W	0	dst write response counter reset
29	R/W	0	disable adding dst write response count to busy bit
28-27	R	0	Unused
26	R/W	0	<p>COLOR_CONVERSION_MODE[1] in alu.</p> <p>Mode[1:0]</p> <p>3 : color_out = color;      2 : color_out = (color != 255) ? color : color + 1;      1 : color_out = (color &lt; 128) ? color : color + 1;      0 : color_out = (color == 0) ? color : color + 1.</p>
25-24	R/W	0	INTERRUPT_CTRL: If bit[0] true, generate interrupt when one command done; if bit[1] true, generate interrupt when ge2d change from busy to not busy.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-22	R/W	0x3	SRC2_BURST_SIZE_CTRL: Source2 DDR request burst size control. (Note: data to source2 are stored together in one DDR memory block.) 0: Burst size = 24 x 64-bit; 1: Burst size = 32 x 64-bit; 2: Burst size = 48 x 64-bit; 3: Burst size = 64 x 64-bit.
21-16	R/W	0x3F	SRC1_BURST_SIZE_CTRL: Source1 DDR request burst size control. Bit[21:20] control Y burst size, bit[19:18] control Cb burst size, bit[17:16] control Cr burst size. Each 2-bit is decoded as below: 0: Burst size = 24 x 64-bit; 1: Burst size = 32 x 64-bit; 2: Burst size = 48 x 64-bit; 3: Burst size = 64 x 64-bit.
15-14	R/W	0	DST1_PIC_STRUCT: Define how destination 1 write the picture to DDR memory. 0: Write all lines (whole frame); 1: Reserved; 2: Write even lines only (top); 3: Write odd lines only (bottom).
13-12	R/W	0	SRC_RD_CTRL: Bit[13] if true, force read src1, bit[12] if true, force read src2.
11	R/W	0	DST2_URGENT_EN: Destination 2 DDR request urgent enable.
10	R/W	0	SRC1_URGENT_EN: Source1 DDR request urgent enable.
9	R/W	0	SRC2_URGENT_EN: Source2 DDR request urgent enable.
8	R/W	0	DST1_URGENT_EN: Destination 1 DDR request urgent enable.
7-0	R/W	0	SRC1_GB_ALPHA: Source1 global alpha.

**GE2D\_GEN\_CTRL2 0x8A2**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	ALPHA_CONVERSION_MODE[0] in alu. Mode[1:0]: 2,3 : alpha_out = (alpha!=255) ? alpha : alpha + 1; 1 : alpha_out = (alpha < 128) ? alpha : alpha + 1; 0 : alpha_out = (alpha == 0) ? alpha : alpha + 1.
30	R/W	0	COLOR_CONVERSION_MODE[0] in alu. Mode[1:0] 3 : color_out = color;

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			2 : color_out = (color != 255) ? color : color + 1; 1 : color_out = (color < 128) ? color : color + 1; 0 : color_out = (color == 0) ? color : color + 1.
29	R/W	0	SRC1_GB_ALPHA_EN in alu. As = src1_gb_alpha_en ? Asr * Ag: Asr
28	R/W	0	DST1_COLOR_ROUND_MODE. 1 = Truncate the full bit color components to required output bit width; 0 = Round (+ 0.5) the full bit color components to required output bit width.
27	R/W	0	SRC2_COLOR_EXPAND_MODE. 1 = Expand the color components to 8-bit by padding LSBs with MSBs. E.g. If the input is 5'b11000, the output is expanded to 8'b11000110; 0 = Expand the color components to 8-bit by padding LSBs with 0.
26	R/W	0	SRC2_ALPHA_EXPAND_MODE. 1 = Expand alpha value to 8-bit by padding LSBs with MSBs. E.g. If the input is 5'b11000, the output is expanded to 8'b11000110; 0 = If input alpha value is all 1, then expand the value to 8-bit by padding LSBs with 1; otherwise, pad LSBs with 0.
25	R/W	0	SRC1_COLOR_EXPAND_MODE. 1 = Expand the color components to 8-bit by padding LSBs with MSBs. E.g. If the input is 5'b11000, the output is expanded to 8'b11000110; 0 = Expand the color components to 8-bit by padding LSBs with 0.
24	R/W	0	SRC1_ALPHA_EXPAND_MODE. 1 = Expand alpha value to 8-bit by padding LSBs with MSBs. E.g. If the input is 5'b11000, the output is expanded to 8'b11000110; 0 = If input alpha value is all 1, then expand the value to 8-bit by padding LSBs with 1; otherwise, pad LSBs with 0.
23	R/W	0	DST_LITTLE_ENDIAN: define the endianess of SRC2 input data. 1 = Little endian; 0 = Big endian.
22-19	R/W	0	DST1_COLOR_MAP: Applicable to 16-bit, 24-bit and 32-bit pixel, defines the bit-field allocation of the pixel data. For whether to truncate or round full 8-bit to output, refer to GE2D_GEN_CTRL2.DST1_COLOR_ROUND_MODE.

Bit(s)	R/W	Default	Description
			<p>For 16-bit mode (DST1_FORMAT=1):</p> <p>0 = Unused;</p> <p>1 = 6:5:5 format. Bit[15:10] is Y[7:2] or R[7:2], bit[9:5] is Cb[7:3] or G[7:3], bit[4:0] is Cr[7:3] or B[7:3];</p> <p>2 = 8:4:4 format. Bit[15:8] is Y or R, bit[7:4] is Cb[7:4] or G[7:4], bit[3:0] is Cr[7:4] or B[7:4];</p> <p>3 = 6:4:4:2 format. Bit[15:10] is Y[7:2] or R[7:2], bit[9:6] is Cb[7:4] or G[7:4], bit[5:2] is Cr[7:4] or B[7:4], bit[1:0] is Alpha[7:6];</p> <p>4 = 4:4:4:4 format. Bit[15:12] is Y[7:4] or R[7:4], bit[11:8] is Cb[7:4] or G[7:4], bit[7:4] is Cr[7:4] or B[7:4], bit[3:0] is Alpha[7:4];</p> <p>5 = 5:6:5 format. Bit[15:11] is Y[7:3] or R[7:3], bit[10:5] is Cb[7:2] or G[7:2], bit[4:0] is Cr[7:3] or B[7:3];</p> <p>6 = 4:4:4:4 format. Bit[15:12] is Alpha[7:4], bit[11:8] is Y[7:4] or R[7:4], bit[7:4] is Cb[7:4] or G[7:4], bit[3:0] is Cr[7:4] or B[7:4];</p> <p>7 = 1:5:5:5 format. Bit[15] is Alpha[7], bit[14:10] is Y[7:3] or R[7:3], bit[9:5] is Cb[7:3] or G[7:3], bit[4:0] is Cr[7:3] or B[7:3];</p> <p>8 = 4:6:4:2 format. Bit[15:12] is Y[7:4] or R[7:4], bit[11:6] is Cb[7:2] or G[7:2], bit[5:2] is Cr[7:4] or B[7:4], bit[1:0] is Alpha[1:0].</p> <p>9 = CbCr format. Bit[15:8] is Cb, bit[7:0] is Cr;</p> <p>10 = CrCb format. Bit[15:8] is Cr, bit[7:0] is Cb.</p> <p>For 24-bit mode (DST1_FORMAT=2):</p> <p>0 = RGB 8:8:8 mode. Bit[23:16] is Y or R, bit[15:8] is Cb or G, bit[7:0] is Cr or B;</p> <p>1 = RGBA 5:6:5:8 mode. 14	R/W	0	SRC1 y end extra bit0, if true, one more chroma line is read for y even end chroma data when y/c ratio = 2
13-0	R/W	0	SRC1 y end, signed data.

**GE2D\_SRC1\_LUT\_ADDR 0x8AC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-9	R	0	Unused.
8	R/W	1	0 = Write LUT, 1 = Read LUT.
7-0	R/W	0	LUT_ADDR: The initial read or write address of the look-up table

**GE2D\_SRC1\_LUT\_DAT 0x8AD**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Current LUT entry's Y or R
23-16	R/W	0	Current LUT entry's Cb or G
15-8	R/W	0	Current LUT entry's Cr or B
7-0	R/W	0	Current LUT entry's Alpha.

**GE2D\_SRC1\_FMT\_CTRL 0x8AE**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-20	R	0	Unused.
19	R/W	0	SRC1_CHFMT_RPT_PIX: if true, horizontal formatter using repeat to get the pixel, otherwise using interpolation.
18	R/W	0	SRC1_CHFMT_EN: horizontal formatter enable.
17	R/W	0	SRC1_CVFMT_RPT_PIX: if true, vertical formatter using repeat to get the pixel, otherwise using interpolation.
16	R/W	0	SRC1_CVFMT_EN: vertical formatter enable.
15-8	R/W	0	SRC1_X_CHR_PHASE: X direction chroma phase, Bit[15:12] for x direction even start/end chroma phase when y/c ratio = 2 or start/end even/odd chroma phase when y/c ratio = 1; Bit[11:8] for x direction odd start/end chroma phase only when y/c ration = 2.
7-0	R/W	0	SRC1_Y_CHR_PHASE:Y direction chroma phase. Bit[7:4] for y direction even start/end chroma phase when y/c ratio = 2 or start/end even/odd chroma phase when y/c ratio = 1; Bit[3:0] for y direction odd start/end chroma phase only when y/c ration = 2.

**GE2D\_SRC2\_DEF\_COLOR 0x8AF**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Default Y or R.
23-16	R/W	0x80	Default Cb or G.
15-8	R/W	0x80	Default Cr or B.
7-0	R/W	0	Default Alpha.

**GE2D\_SRC2\_CLIPX\_START\_END 0x8B0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused.
28-16	R/W	0	SRC2 clip x start.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-13	R	0	Unused.
12-0	R/W	0x1FFF	SRC2 clip x end.

**GE2D\_SRC2\_CLIPY\_START\_END 0x8B1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused.
28-16	R/W	0	SRC2 clip y start.
15-13	R	0	Unused.
12-0	R/W	0x1FFF	SRC2 clip y end.

**GE2D\_SRC2\_X\_START\_END 0x8B2**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused.
28-16	R/W	0	SRC2 x start.
15-13	R	0	Unused.
12-0	R/W	0	SRC2 x end.

**GE2D\_SRC2\_Y\_START\_END 0x8B3**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused.
28-16	R/W	0	SRC2 y start.
15-13	R	0	Unused.
12-0	R/W	0	SRC2 y end.

**GE2D\_DST\_CLIPX\_START\_END 0x8B4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused.
28-16	R/W	0	DST clip x start.
15-13	R	0	Unused.
12-0	R/W	0x1FFF	DST clip x end.

**GE2D\_DST\_CLIPY\_START\_END 0x8B5**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused.

28-16	R/W	0	DST clip y start.
15-13	R	0	Unused.
12-0	R/W	0x1FFF	DST clip y end.

**GE2D\_DST\_X\_START\_END 0x8B6**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-16	R/W	0	DST x start.
15-13	R	0	Unused.
12-0	R/W	0	DST x end.

**GE2D\_DST\_Y\_START\_END 0x8B7**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-16	R/W	0	DST y start.
15-13	R	0	Unused.
12-0	R/W	0	DST y end.

**GE2D\_SRC2\_DST\_CANVAS 0x8B8**

Bit(s)	R/W	Default	Description
31-24	R	0	Unused.
23-16	R/W	0	DST2 canvas address.
15-8	R/W	0	SRC2 canvas address.
7-0	R/W	0	DST1 canvas address.

**GE2D\_VSC\_START\_PHASE\_STEP 0x8B9**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-0	R/W	0x01000000	5.24 format.

**GE2D\_VSC\_PHASE\_SLOPE 0x8BA**

Bit(s)	R/W	Default	Description
31-25	R	0	Unused.
24-0	R/W	0	Signed data.

**GE2D\_VSC\_INI\_CTRL 0x8BB**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0	Unused.
30-29	R/W	0	vertical repeat line0 number.
28-24	R	0	Unused.
23-0	R/W	0	vertical scaler initial phase.

**GE2D\_HSC\_START\_PHASE\_STEP 0x8BC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused.
28-0	R/W	0x01000000	5.24 format.

**GE2D\_HSC\_PHASE\_SLOPE 0x8BD**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-25	R	0	Unused.
24-0	R/W	0	Signed data.

**GE2D\_HSC\_INI\_CTRL 0x8BE**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0	Unused.
30-29	R/W	0	horizontal repeat line0 number.
28-24	R	0	Unused.
23-0	R/W	0	horizontal scaler initial phase.

**GE2D\_HSC\_ADV\_CTRL 0x8BF**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	advance number in this round, if horizontal scaler is working on dividing mode.
23-0	R/W	0	horizontal scaler advance phase in this round, if horizontal scaler is working on dividing mode.

**GE2D\_SC\_MISC\_CTRL 0x8C0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0	Unused.
30	R/W	0	VSC_NEAREST_EN: vertical nearest mode enable, must set vt_bank_length = 4.
29	R/W	0	HSC_NEAREST_EN: horizontal nearest mode enable, must set hz_bank_length = 4.

28	R/W	0	HSC_DIV_EN: horizontal scaler dividing mode enable.
27-15	R/W	0	HSC_DIV_LENGTH: horizontal dividing length, if bit 25 is enable.
14	R/W	0	pre horizontal scaler enable.
13	R/W	0	pre vertical scale enable.
12	R/W	0	vertical scale enable.
11	R/W	0	horizontal scaler enable.
10	R	0	Unused.
9	R/W	0	HSC_RPT_CTRL: if true, treat horizontal repeat line number(GE2D_HSC_INI_CTRL bit 30:29) as repeating line, otherwise using treat horizontal repeat line number as minus line number.
8	R/W	0	VSC_RPT_CTRL: if true, treat vertical repeat line number(GE2D_VSC_INI_CTRL bit 30:29) as repeating line, otherwise using treat vertical repeat line number as minus line number.
7	R/W	0	VSC_PHASE0_ALWAYS_EN: if true, always use phase0 in vertical scaler.
6-4	R/W	2	VSC_BANK_LENGTH: vertical scaler bank length.
3	R/W	0	HSC_PHASE0_ALWAYS_EN: if true, always use phase0 in horizontal scaler.
2-0	R/W	2	HSC_BANK_LENGTH: horizontal scaler bank length.

**GE2D\_VSC\_NRND\_POINT 0x8C1**

Bit(s)	R/W	Default	Description
31-14	R	0	Unused.
13-0	R	0	vertical scaler next round integer pixel pointer, signed data.

**GE2D\_VSC\_NRND\_PHASE 0x8C2**

Bit(s)	R/W	Default	Description
31-24	R	0	Unused.
23-0	R	0	vertical scaler next round phase.

**GE2D\_HSC\_NRND\_POINT 0x8C3**

Bit(s)	R/W	Default	Description
31-14	R	0	Unused.
13-0	R	0	horizontal scaler next round integer pixel pointer, signed data.

**GE2D\_HSC\_NRND\_PHASE 0x8C4**

Bit(s)	R/W	Default	Description
31-24	R	0	Unused.

23-0	R	0	horizontal scaler next round phase.
------	---	---	-------------------------------------

**GE2D\_MATRIX\_PRE\_OFFSET 0x8C5**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-20	R/W	0	pre_offset0.
19	R	0	Unused.
18-10	R/W	0	pre_offset1.
9	R	0	Unused.
8-0	R/W	0	pre_offset2.

**GE2D\_MATRIX\_COEF00\_01 0x8C6**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-16	R/W	0	coef00.
15-13	R	0	Unused.
12-0	R/W	0	coef01.

**GE2D\_MATRIX\_COEF02\_10 0x8C7**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-16	R/W	0	Coef02.
15-13	R	0	Unused.
12-0	R/W	0	Coef10.

**GE2D\_MATRIX\_COEF11\_12 0x8C8**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-16	R/W	0	Coef11.
15-13	R	0	Unused.
12-0	R/W	0	Coef12.

**GE2D\_MATRIX\_COEF20\_21 0x8C9**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.

28-16	R/W	0	Coef20.
15-13	R	0	Unused.
12-0	R/W	0	Coef21.

**GE2D\_MATRIX\_COEF22\_CTRL 0x8CA**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-16	R/W	0	coef22.
15-8	R	0	Unused.
7	R/W	0	input y/cb/cr saturation enable.
6-1	R	0	Unused.
0	R/W	0	conversion matrix enable.

**GE2D\_MATRIX\_OFFSET 0x8CB**

Bit(s)	R/W	Default	Description
31-29	R	0	Unused.
28-20	R/W	0	offset0.
19	R	0	Unused.
18-10	R/W	0	offset1.
9	R	0	Unused.
8-0	R/W	0	offset2.

**GE2D\_ALU\_OP\_CTRL 0x8CC**

Bit(s)	R/W	Default	Description
31-27	R	0	Unused.
26-25	R/W	0	SRC1 color multiplier alpha selection. if 00, Cs = Csr if 01, Cs = Csr * Asr * Ag (if source is not premultiplied) if 10, Cs = Csr * Ag (if source is premultiplied).
24	R/W	0	SRC2 color multiplier alpha selection. if 0, no multiplier, Cd = Cdr, otherwise, Cd = Cdr * Ad.
23	R	0	Unused.
22-12	R/W	0x010	ALU color operation. Bit[22:20] Blending Mode Parameter. 3'b000: ADD $Cs^*Fs + Cd^*Fd$

10-0	R/W	0x010	ALU alpha operation.																																																																																																

Bit(s)	R/W	Default	Description
			<p>Bit[10:8] Blending Equation Math Operation.</p> <p>3'b000: ADD <math>As^*Fs + Ad^*Fd</math>      3'b001: SUBTRACT <math>As^*Fs - Ad^*Fd</math>      3'b010: REVERSE SUBTRACT <math>Ad^*Fd - As^*Fs</math>      3'b011: MIN <math>\min(As^*Fs, Ad^*Fd)</math>      3'b100: MAX <math>\max(As^*Fs, Ad^*Fd)</math>      3'b101: LOGIC OP <math>As \text{ op } Ad</math>      .... reserved</p> <p>Bit[7:4] Source alpha Blending Factor AFs.</p> <p>4'b0000 0      4'b0001 1      4'b0010 As      4'b0011 1 - As      4'b0100 Ad      4'b0101 1 - Ad      4'b0110 Ac      4'b0111 1 - Ac      .... reserved</p> <p>Bit[3:0] Destination alpha Blending Factor AFd, when bit[10:8] != LOGIC OP.</p> <p>4'b0000 0      4'b0001 1      4'b0010 As      4'b0011 1 - As      4'b0100 Ad      4'b0101 1 - Ad      4'b0110 Ac      4'b0111 1 - Ac      .... reserved</p> <p>Bit[3:0] logic operations, when bit[10:8] == LOGIC OP.</p> <p>4'b0000: CLEAR 0      4'b0001: COPY s      4'b0010: NOOP d      4'b0011: SET 1      4'b0100: COPY_INVERT <math>\sim s</math>      4'b0101: INVERT <math>\sim d</math>      4'b0110: AND_REVERSE <math>s \&amp; \sim d</math>      4'b0111: OR_REVERSE <math>s   \sim d</math>      4'b1000: AND <math>s \&amp; d</math>      4'b1001: OR <math>s   d</math>      4'b1010: NAND <math>\sim(s \&amp; d)</math>      4'b1011: NOR <math>\sim(s   d)</math>      4'b1100: XOR <math>s \wedge d</math>      4'b1101: EQUIV <math>\sim(s \wedge d)</math>      4'b1110: AND_INVERTED <math>\sim s \&amp; d</math>      4'b1111: OR_INVERTED <math>\sim s   d</math></p>

**GE2D\_ALU\_CONST\_COLOR 0x8CD**

Bit(s)	R/W	Default	Description
31-0	R/W	0x00808000	RGB or YCbCrA.

**GE2D\_SRC1\_KEY 0x8CE**

Bit(s)	R/W	Default	Description
31-0	R/W	0	SRC1 Key.

**GE2D\_SRC1\_KEY\_MASK 0x8CF**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R/W	0	SRC1 Key Mask.

**GE2D\_SRC2\_KEY 0x8D0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R/W	0	SRC2 Key.

**GE2D\_SRC2\_KEY\_MASK 0x8D1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R/W	0	Destination Bit Mask.

**GE2D\_DP\_ONOFF\_CTRL 0x8D3**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	DP onoff mode. 0: on_counter means how many pixels will output before ge2d turns off; 1: on_counter means how many clocks will ge2d turn on before ge2d turns off.
30-16	R/W	0	DP on counter.
15	R/W	0	0: vd_format doesnt have onoff mode, 1: vd format has onoff mode.
14-0	R/W	0	DP off counter.

**GE2D\_SCALE\_COEF\_IDX 0x8D4**

Because there are many coefficients used in the vertical filter and horizontal filters, indirect access the coefficients of vertical filter and horizontal filter is used. For vertical filter, there are 33x4 coefficients. For horizontal filter, there are 33x4 coefficients

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	Unused.
15	R/W	0	index increment, if bit9 == 1 then (0: index increase 1, 1: index increase 2) else (index increase 2).
14	R/W	0	1: read coef through cbus enable, just for debug purpose in case when we wanna check the coef in ram in correct or not.
13-10	R	0	Unused.
9	R/W	0	if true, use 9bit resolution coef, other use 8bit resolution coef.
8	R/W	0	type of index, 0: vertical coef; 1: horizontal coef.
7	R	0	Unused.
6-0	R/W	0	coef index.

**GE2D\_SCALE\_COEF 0x8D5**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R/W	0	coefficients for vertical filter and horizontal filter.

**GE2D\_SRC\_OUTSIDE\_ALPHA 0x8D6**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-25	R	0	Unused.
24	R/W	0	<p>src2 alpha fill mode: together with GE2D_GEN_CTRL0[14](fill_mode), define what alpha values are used.            0: repeat inner alpha, 1: fill src2 outside alpha.</p> <p>for the area outside the clipping window. As below:</p> <p>fill_mode=0, alpha_fill_mode=0 : use inner alpha, (or default_alpha if src data have no alpha values);            fill_mode=0, alpha_fill_mode=1 : use outside_alpha;            fill_mode=1, alpha_fill_mode=0 : use default_alpha;            fill_mode=1, alpha_fill_mode=1 : use outside_alpha.</p>
23-16	R/W	16	src2 outside alpha.
15-9	R	0	Unused.
8	R/W	1	src1 alpha fill mode, refer to src2 alpha fill mode above.
7-0	R/W	0	src1 outside alpha.

**GE2D\_ANTIFLICK\_CTRL0 0x8D8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	antiflick enable
24	R/W	0	1: alpha value for the first line use repeated alpha, 0: use bit 23:16 as the first line alpha
23-16	R/W	0	register value for the first line alpha when bit 24 is 1.
8	R/W	0	1: alpha value for the last line use repeated alpha, 0: use bit 7:0 as the last line alpha
7-0	R/W	0	register value for the last line alpha when bit 8 is 1.

**GE2D\_ANTIFLICK\_CTRL1 0x8D9**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
25	R/W	0	rgb_sel, 1: antiflick RGBA, 0: antiflick YCbCrA
24	R/W	0	cbcr_en, 1: also filter cbcr in case of antiflicking YCbCrA, 0: no filter on cbcr in case of antiflicking YCbCrA
23-16	R/W	0	R mult coef for converting RGB to Y
15-8	R/W	0	G mult coef for converting RGB to Y

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
7-0	R/W	0	B mult coef for converting RGB to Y
$Y = (R * y\_r + G * y\_g + B * y\_b) / 256$			

**GE2D\_ANTIFLICK\_COLOR\_FILT0 0x8DA**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Y threshold1, when $0 < Y \leq th1$ , use filter0.
23-16	R/W	0	color antiflick filter0 n3
15- 8	R/W	0	color antiflick filter0 n2
7-0	R/W	0	color antiflick filter0 n1
$Y = (line\_up * n1 + line\_center * n2 + line\_dn * n3) / 128$			

**GE2D\_ANTIFLICK\_COLOR\_FILT1 0x8DB**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Y threshold2, when $th1 < Y \leq th2$ , use filter1.
23-16	R/W	0	color antiflick filter1 n3
15- 8	R/W	0	color antiflick filter1 n2
7-0	R/W	0	color antiflick filter1 n1

**GE2D\_ANTIFLICK\_COLOR\_FILT2 0x8DC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Y threshold3, when $th2 < Y \leq th3$ , use filter2 ; $Y > th3$ , use filter3.
23-16	R/W	0	color antiflick filter2 n3
15- 8	R/W	0	color antiflick filter2 n2
7-0	R/W	0	color antiflick filter2 n1

**GE2D\_ANTIFLICK\_COLOR\_FILT3 0x8DD**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-16	R/W	0	color antiflick filter3 n3
15- 8	R/W	0	color antiflick filter3 n2
7-0	R/W	0	color antiflick filter3 n1

**GE2D\_ANTIFLICK\_ALPHA\_FILT0 0x8DE**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Alpha threshold1, when $0 < Alpha \leq th1$ , use filter0.
23-16	R/W	0	Alpha antiflick filter0 n3

15- 8	R/W	0	Alpha antiflick filter0 n2
7-0	R/W	0	Alpha antiflick filter0 n1

Alpha = (line\_up \* n1 + line\_center \* n2 + line\_dn \* n3) / 128

#### GE2D\_ANTIFLICK\_ALPHA\_FILT1 0x8DF

Bit(s)	R/W	Default	Description
31-24	R/W	0	Alpha threshold2, when th1< Alpha<=th2, use filter1.
23-16	R/W	0	Alpha antiflick filter1 n3
15- 8	R/W	0	Alpha antiflick filter1 n2
7-0	R/W	0	Alpha antiflick filter1 n1

#### GE2D\_ANTIFLICK\_ALPHA\_FILT2 0x8E0

Bit(s)	R/W	Default	Description
31-24	R/W	0	Alpha threshold3, when th2< Alpha<=th3, use filter2; Alpha>th3, use filter3.
23-16	R/W	0	Alpha antiflick filter2 n3
15- 8	R/W	0	Alpha antiflick filter2 n2
7-0	R/W	0	Alpha antiflick filter2 n1

#### GE2D\_ANTIFLICK\_ALPHA\_FILT3 0x8E1

Bit(s)	R/W	Default	Description
23-16	R/W	0	Alpha antiflick filter3 n3
15- 8	R/W	0	Alpha antiflick filter3 n2
7-0	R/W	0	Alpha antiflick filter3 n1

#### GE2D\_SRC1\_RANGE\_MAP\_Y\_CTRL 0x8E3

Bit(s)	R/W	Default	Description
30-22	R/W	0	din_offset (signed data)
21-14	R/W	0	map_coef (unsigned data)
13- 10	R/W	0	map_sr (unsigned data)
9-1	R/W	0	dout_offset (signed data)
0	R/W	0	enable

dout = clip0\_0\_255(((din + din\_offset) \* map\_coef + ((1 << (map\_sr - 1))) >> map\_sr + dout\_offset))

#### GE2D\_SRC1\_RANGE\_MAP\_CB\_CTRL 0x8E4

Bit(s)	R/W	Default	Description
30-22	R/W	0	din_offset (signed data)

21-14	R/W	0	map_coef (unsigned data)
13- 10	R/W	0	map_sr (unsigned data)
9-1	R/W	0	dout_offset (signed data)
0	R/W	0	enable

dout = clipto\_0\_255(((din + din\_offset) \* map\_coef + ((1 << (map\_sr - 1))) >> map\_sr + dout\_offset)

#### GE2D\_SRC1\_RANGE\_MAP\_CR\_CTRL 0x8E5

Bit(s)	R/W	Default	Description
30-22	R/W	0	din_offset (signed data)
21-14	R/W	0	map_coef (unsigned data)
13- 10	R/W	0	map_sr (unsigned data)
9-1	R/W	0	dout_offset (signed data)
0	R/W	0	enable

dout = clipto\_0\_255(((din + din\_offset) \* map\_coef + ((1 << (map\_sr - 1))) >> map\_sr + dout\_offset)

#### GE2D\_ARB\_BURST\_NUM 0x8E6

Bit(s)	R/W	Default	Description
21-16	R/W	0x3f	Src1 preebitor burst number
13-8	R/W	0x3f	Src2 preebitor burst number
5-0	R/W	0x3f	dst preebitor burst number

#### GE2D\_TID\_TOKEN 0x8E7

Bit(s)	R/W	Default	Description
21-16	R/W	0x3f	Src1 ID. High 4bit are thread ID, low 2bits are the token
13-8	R/W	0x3f	Src2 ID. High 4bit are thread ID, low 2bits are the token
5-0	R/W	0x3f	dst ID. High 4bit are thread ID, low 2bits are the token

#### GE2D\_GEN\_CTRL3 0x8E8

Bit(s)	R/W	Default	Description
31-28	R/W	0	DST2_BYTEMASK_VAL: 1-bit mask for each byte (8-bit). Applicable only if both dst_bitmask_en=1 and dst_bytemask_only=1.
27-26	R/W	0	DST2_PIC_STRUCT: Define how destination 2 write the picture to DDR memory. 0: Write all lines (whole frame); 1: Reserved; 2: Write even lines only (top); 3: Write odd lines only (bottom).

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
25-24	R/W	0	DST2_8B_MODE_SEL: Destination 8-bit mode component selection. 0: Select Y or R; 1: Select Cb or G; 2: Select Cr or B; 3: Select Alpha.
23	R	0	Unused
22-19	R/W	0	<p>DST2_COLOR_MAP: Applicable to 16-bit, 24-bit and 32-bit pixel, defines the bit-field allocation of the pixel data. For whether to truncate or round full 8-bit to output, refer to GE2D_GEN_CTRL3.DST2_COLOR_ROUND_MODE.</p> <p>For 16-bit mode (DST2_FORMAT=1):</p> <p>0 = Unused;</p> <p>1 = 6:5:5 format. Bit[15:10] is Y[7:2] or R[7:2], bit[9:5] is Cb[7:3] or G[7:3], bit[4:0] is Cr[7:3] or B[7:3];</p> <p>2 = 8:4:4 format. Bit[15:8] is Y or R, bit[7:4] is Cb[7:4] or G[7:4], bit[3:0] is Cr[7:4] or B[7:4];</p> <p>3 = 6:4:4:2 format. Bit[15:10] is Y[7:2] or R[7:2], bit[9:6] is Cb[7:4] or G[7:4], bit[5:2] is Cr[7:4] or B[7:4], bit[1:0] is Alpha[7:6];</p> <p>4 = 4:4:4:4 format. Bit[15:12] is Y[7:4] or R[7:4], bit[11:8] is Cb[7:4] or G[7:4], bit[7:4] is Cr[7:4] or B[7:4], bit[3:0] is Alpha[7:4];</p> <p>5 = 5:6:5 format. Bit[15:11] is Y[7:3] or R[7:3], bit[10:5] is Cb[7:2] or G[7:2], bit[4:0] is Cr[7:3] or B[7:3];</p> <p>6 = 4:4:4:4 format. Bit[15:12] is Alpha[7:4], bit[11:8] is Y[7:4] or R[7:4], bit[7:4] is Cb[7:4] or G[7:4], bit[3:0] is Cr[7:4] or B[7:4];</p> <p>7 = 1:5:5:5 format. Bit[15] is Alpha[7], bit[14:10] is Y[7:3] or R[7:3], bit[9:5] is Cb[7:3] or G[7:3], bit[4:0] is Cr[7:3] or B[7:3];</p> <p>8 = 4:6:4:2 format. Bit[15:12] is Y[7:4] or R[7:4], bit[11:6] is Cb[7:2] or G[7:2], bit[5:2] is Cr[7:4] or B[7:4], bit[1:0] is Alpha[1:0];</p> <p>9 = CbCr format. Bit[15:8] is Cb, bit[7:0] is Cr;</p> <p>10 = CrCb format. Bit[15:8] is Cr, bit[7:0] is Cb.</p> <p>For 24-bit mode (DST2_FORMAT=2):</p> <p>0 = RGB 8:8:8 mode. Bit[23:16] is Y or R, bit[15:8] is Cb or G, bit[7:0] is Cr or B;</p> <p>1 = RGBA 5:6:5:8 mode. Bit[23:19] is Y[7:3] or R[7:3], bit[18:13] is Cb[7:2] or G[7:2], bit[12:8] is Cr[7:3] or B[7:3], bit[7:0] is Alpha;</p> <p>2 = ARGB 8:5:6:5 mode. Bit[23:16] is Alpha, bit[15:11] is Y[7:3] or R[7:3], bit[10:5] is Cb[7:2] or G[7:2], bit[4:0] is Cr[7:3] or B[7:3];</p> <p>3 = RGBA 6:6:6:6 mode. Bit[23:18] is Y[7:2] or R[7:2], bit[17:12] is Cb[7:2] or G[7:2], bit[11:6] is Cr[7:2] or B[7:2], bit[5:0] is Alpha[7:2];</p> <p>4 = ARGB 6:6:6:6 mode. Bit[23:18] is Alpha[7:2], bit[17:12] is Y[7:2] or R[7:2], bit[11:6] is Cb[7:2] or G[7:2], bit[5:0] is Cr[7:2] or B[7:2];</p> <p>5 = BGR 8:8:8 mode. Bit[23:16] is Cr or B, bit[15:8] is Cb or G, bit[7:0] is Y or R.</p> <p>For 32-bit mode (DST2_FORMAT=3):</p>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			0 = RGBA 8:8:8:8 format. Bit[31:24] is Y or R, bit[23:16] is Cb or G; bit[15:8] is Cr or B; bit[7:0] is Alpha; 1 = ARGB 8:8:8:8 format. Bit[31:24] is Alpha, bit[23:16] is Y or R; bit[15:8] is Cb or G; bit[7:0] is Cr or B; 2 = ABGR 8:8:8:8 format. Bit[31:24] is Alpha, bit[23:16] is Cr or B; bit[15:8] is Cb or G; bit[7:0] is Y or R; 3 = BGRA 8:8:8:8 format. Bit[31:24] is Cr or B, bit[23:16] is Cb or G; bit[15:8] is Y or R; bit[7:0] is Alpha.
18	R	0	Unused
17-16	R/W	0	DST2_FORMAT: define DST2 output pixel byte-width. 0: Output pixel is 1-byte (8-bit) color component; 1: Output pixel is 2-byte (16-bit), refer to GE2D_GEN_CTRL3.DST2_COLOR_MAP for further pixel color mapping; 2: Output pixel is 3-byte (24-bit), refer to GE2D_GEN_CTRL3.DST2_COLOR_MAP for further pixel color mapping; 3: Output pixel is 4-byte (32-bit), refer to GE2D_GEN_CTRL3.DST2_COLOR_MAP for further pixel color mapping.
15	R	0	Unused
14	R/W	0	DST2_COLOR_ROUND_MODE. 1 = Truncate the full bit color components to required output bit width; 0 = Round (+ 0.5) the full bit color components to required output bit width.
13-12	R/W	0	DST2_X_DISCARD_MODE: Define how DST2 discard X direction data before writing to DDR. Note: x is post reverse/rotation. 0: No discard; 1: Reserved; 2: discard even x; 3: discard odd x.
11-10	R/W	0	DST2_Y_DISCARD_MODE: Define how DST2 discard Y direction data before writing to DDR. Note: y is post reverse/rotation. 0: No discard; 1: Reserved; 2: discard even y; 3: discard odd y.
9	R	0	Unused
8	R/W	0	DST2_ENABLE: 0: Disable destination 2; 1: Enable destination 2.
7-6	R	0	Unused

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5-4	R/W	0	DST1_X_DISCARD_MODE: Define how DST1 discard X direction data before writing to DDR.  Note: x is post reverse/rotation. 0: No discard; 1: Reserved; 2: discard even x; 3: discard odd x.
3-2	R/W	0	DST1_Y_DISCARD_MODE: Define how DST1 discard Y direction data before writing to DDR.  Note: y is post reverse/rotation. 0: No discard; 1: Reserved; 2: discard even y; 3: discard odd y.
1	R	0	Unused
0	R/W	1	DST1_ENABLE: 0: Disable destination 1; 1: Enable destination 1.

**GE2D\_STATUS2 0x8E9**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
13-12	R	0	ge2d_dst1.ctrl_status
11	R	0	ge2d_dst1.map_srdy
10	R	0	ge2d_dst1.map_d1_srdy
9	R	0	ge2d_dst1.s_v
8	R	0	ge2d_dst1.ofifo_dout_srdy
7-1	R	0	ge2d_dst1.ofifo_cnt
0	R	0	ge2d_dst1.dst_busy

**GE2D\_GEN\_CTRL4 0x8EA**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0	R/W	0	dis_dp_hang_bugfix.

**GE2D\_DST1\_BADDR\_CTRL 0x8f1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R/W	0	DST1 base address in 64bits.

**GE2D\_DST1\_STRIDE\_CTRL 0x8f2**

Bit(s)	R/W	Default	Description
19-0	R/W	0	DST1 stride size in 64bits.

**GE2D\_SRC1\_BADDR\_CTRL 0x8f3**

Bit(s)	R/W	Default	Description
31-0	R/W	0	SRC1 base address in 64bits.

**GE2D\_SRC1\_STRIDE\_CTRL 0x8f4**

Bit(s)	R/W	Default	Description
19-0	R/W	0	SRC1 stride size in 64bits.

**GE2D\_SRC2\_BADDR\_CTRL 0x8f5**

Bit(s)	R/W	Default	Description
31-0	R/W	0	SRC2 base address in 64bits.

**GE2D\_SRC2\_STRIDE\_CTRL 0x8f6**

Bit(s)	R/W	Default	Description
19-0	R/W	0	SRC2 stride size in 64bits.

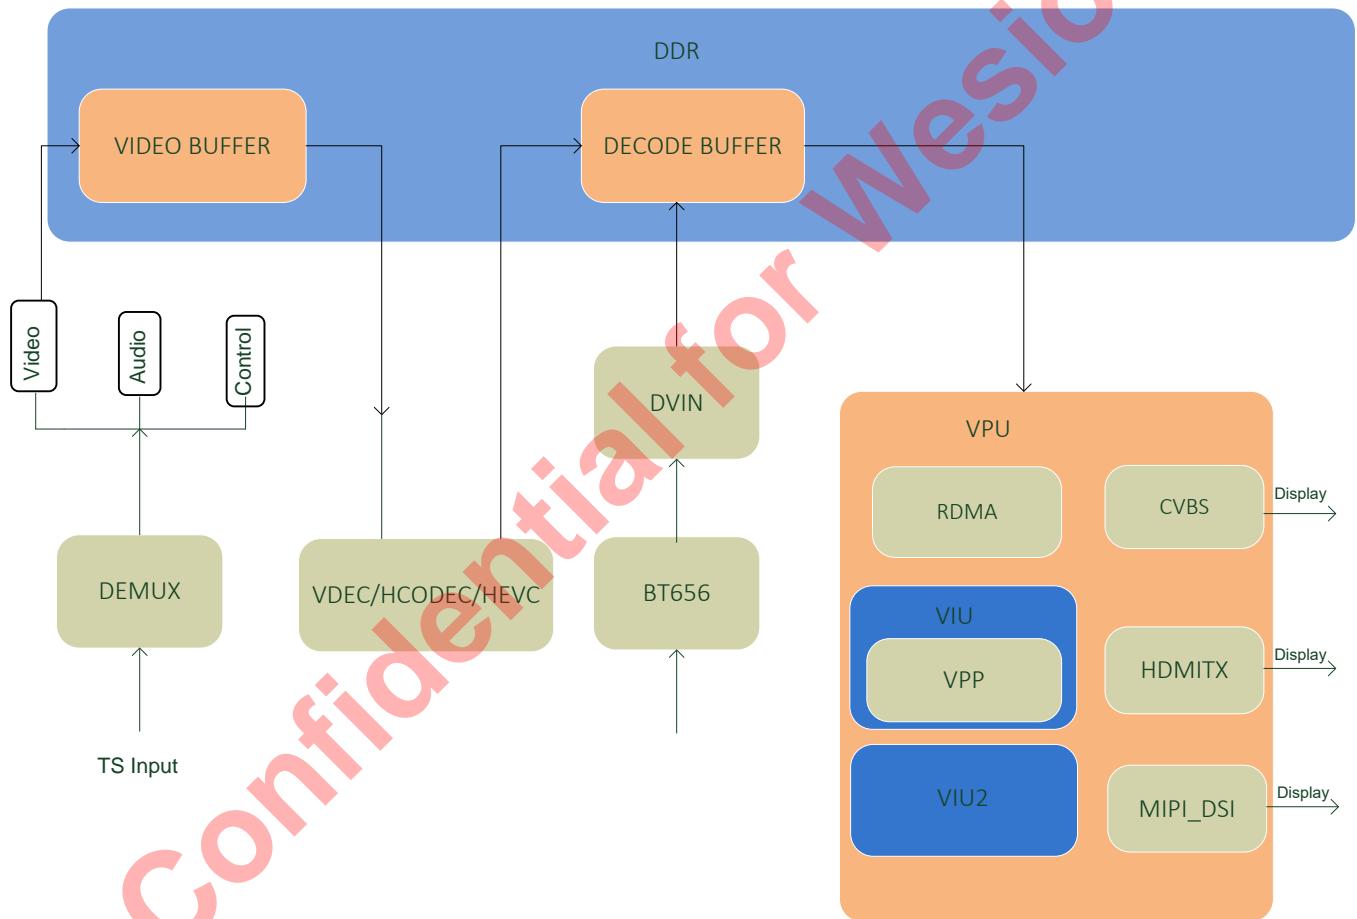

## 10. Video Path

The data path of the video path module is shown in Figure 10-1 below:

This section describe A311D video path from the following aspects:

- Video Input
- Video Output
  - RDMA
  - VPP(VIU/VPP)
  - CVBS
  - HDMI TX
  - MIPI-DSI

**Figure 10-1 Data Path of Video Path**

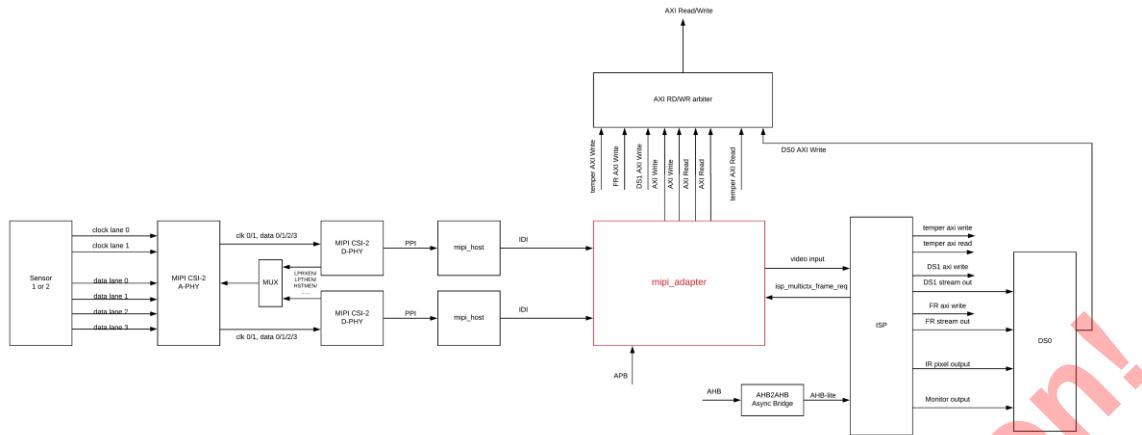

### 10.1 Video Input

#### 10.1.1 Overview

This part describes the video input module of A311D, include MIPI CSI and DEMUX.

Figure below shows the MIPI CSI-ISP data path.

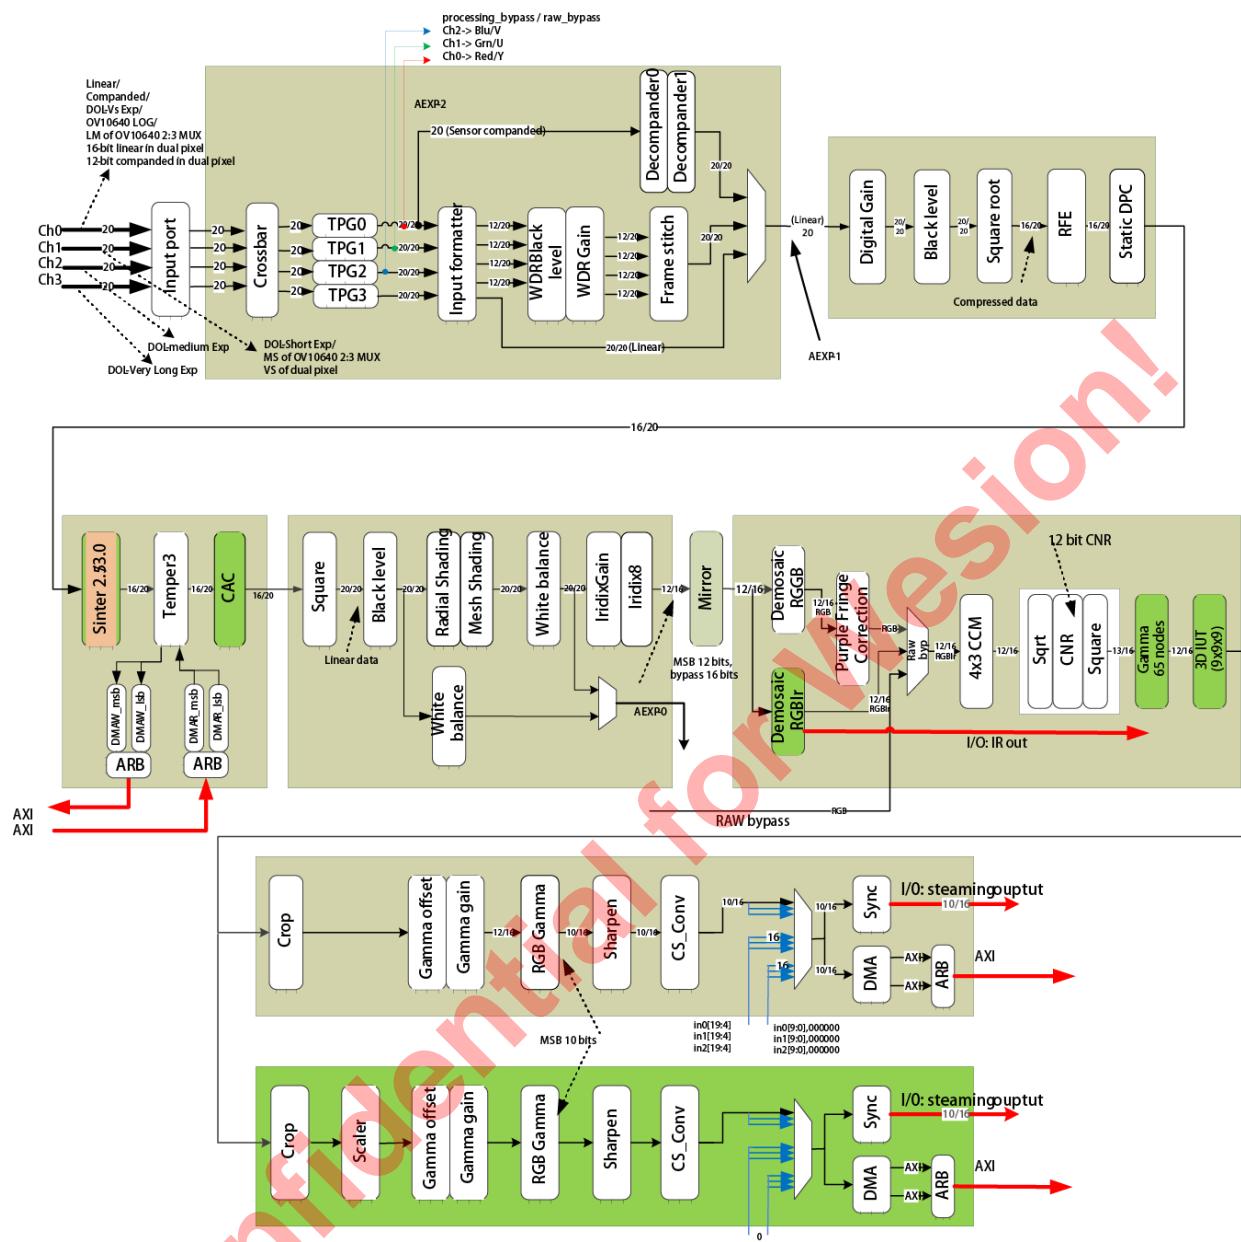

**Figure 10-2 MIPI CSI Data Path**

MIPI CSI host has the following features.

- Support up to 2 cameras, up to 8M pixel sensors, up to 60 fps
- 1 x 8Mpix x 60fps, or 1x 8Mpix x 30fps x 2exp
- 2 x 4Mpix x 60fps, or 2x 8Mpix x 30fps

Figure below shows the ISP internal data flow.

Figure 10-3 ISP Data Path

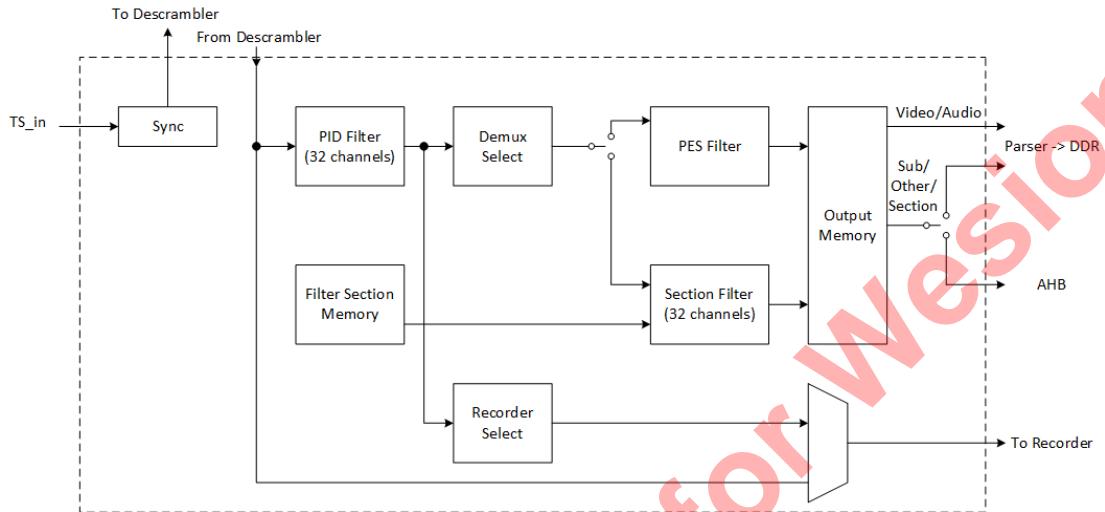

ISP features are listed below:

- Supports HDR sensor decompanding/ Dynamic Defect Pixel Correction/ Green channel equalization/ EW image flip
- Supports multipixel input
- Supports 3A(AE/AWB/AF)
- Supports Spatial/Temporal/Color Noise reduction
- Supports Static White balance
- Supports Lens shading correction
- Supports Demosaic
- Supports Chromatic aberration/purple Fringing correction
- Supports linear matrix color correction
- Supports Gamma correction

- Supports RGB sharpening
- Supports max resolution of 3840\*2160@60fps

A311D uses DEMUX to handle input video signals, and store the demuxed signal in DDR, which can be read directly.

Demux submodule of A311D is designed for connecting to external digital TV tuner/demodular and demux the input signal. It decomposes the input signal from TS/DDR into video signal, audio signal, and clock signal, the video signal will be first written in to DDR, then decoded by the video decoder(VDEC). Below shows the diagram of Demux submodule.

A311D intergrades 3 demux controllers, with the following features:

- Supports PID filter up to 32 channels
- Supports session filter up to 32 channels
- Supports up to 96 channels filter when use 3 demux as one group
- Supports AES/DES/DVB-CSA 1.0 crypto
- Supports inputs from both external TS inputs (serial or parallel, depending on pinmux) and DDR memory (file playback path)
- Supports input loopback to TS-out pins
- Supports separate selection for playback and recorder

## 10.1.2 Register Description

### 10.1.2.1 MIPI CSI Registers

Below are MIPI analog PHY registers.

**hi\_csi\_phy\_ctrl0 0xFF63C34C**

Bit(s)	R/W	Name	Description
31:28			lane 4 skew
27			HS skew adjust enable
26			HS CML resistor selection control, 1'b0: for larger than 1Gbps.
25			csi sync block reset signal, 1'b1: enable , 1'b0: reset

Bit(s)	R/W	Name	Description
24			1'b1: enable BG/regulator power up control
23:20			low level reference voltage control in low power mode with one hot code
19:16			highlevel reference voltage control in low power mode with one hot code
15:12			lane 5 skew
11			low power mode bias current generation method
10:7			RX term resistor trimming control with binary code
6			lane high speed and low power mode bias current generation method
5:4			low power mode RX receiver bias current control
3:1			high speed mode RX receiver bias current control
0			lane hs/lp mode bias current generation using BG current input mode enable control

**hi\_csi\_phy\_ctrl1 0xFF63C350**

Bit(s)	R/W	Name	Description
31			csi_ttl_en
21			CH5 power up
20			CH4 power up
19			CH3 power up
18			CH2 power up
17			CH1 power up
16			CH0 power up
15:12			lane 3 skew
11:8			lane 2 skew
7:4			lane 1 skew
3:0			lane 0 skew

**hi\_csi\_phy\_ctrl2 0xFF63C354**

Bit(s)	R/W	Name	Description
31			csi2_pt_en : production test
19: 0			csi2_pt_ctrl

**hi\_csi\_phy\_ctrl3 0xFF63C358**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
23			skew from Dphy
22			mbias_en from DPHY1
21			lane5 MUX to DPHY1
20			lane4 MUX to DPHY1
19			lane3 MUX to DPHY1
18			lane2 MUX to DPHY1
17			lane1 MUX to DPHY1
16			lane0 MUX to DPHY1
15			1'b1: hsout4_r/f use clock hsout5_ck, 1'b0: use hsout2_ck
14			1'b1: hsout3_r/f use clock hsout5_ck, 1'b0: use hsout2_ck
13			1'b1: hsout1_r/f use clock hsout5_ck, 1'b0: use hsout2_ck
12			1'b1: hsout0_r/f use clock hsout5_ck, 1'b0: use hsout2_ck
4			local regulator reference voltage generation method
3			local regulator reference voltage generation method
2			local regulator reference voltage generation method
1:0			regulator reference voltage selection control

Below are MIPI digital PHY registers. For PHY0, the base address is ff650000, for PHY1, the base address is ff652000. The final address of each register is calculated as: final address = base address + offset\*4.

**MIPI\_PHY\_CTRL 0x00**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
31			soft reset. set 1 will reset the MIPI phy cil_scnn and cil_sfen modules. set 0 will release the reset. it's level signal.
20			if set, all analog control signals will directly from the related register bit
19:18			mipi hs clock to pad selection. //2'b00 : no output. //2'b01 : output /2 clock. //2'b10 : output /4 clock. //2'b11 : output /8 clock.
{22,17:15}			mipi analog signal to pad selection. //3'b000: no output.

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
			//3'b001: clock lane. //3'b010: data lane 0. //3'b011: data lane 1. //3'b100: data lane 2. //3'b101: data lane 3.
13			ddr to reg. enable this bit the 8 interface DFFs result will be latch to // MIPI_PHY_DDR_STS registers.
12			enable this bit : all analog output signal will be latched to MIPI_PHY_ANA_STS registers.
11			Reserved
10			force analog MBIAS enable.
9:5			mipi_chpu to analog.
4			shut down digital clock lane.
3			Shut down digital data lane 3.
2			Shut down digital data lane 2.
1			Shut down digital data lane 1.
0			Shut down digital data lane 0.

**MIPI\_PHY\_CLK\_LANE\_CTRL 0x01**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
11			force clock lane TH check enable.
10			force clock lane LP enable.
9			force clock lane HS RECEIVER enable this signal is not used by analog.
8			force clock lane terminator enable
7			if set, will disable clock lane LPEN if clock lane is in HS mode. // if not set, the LPEN is always enabled until in ULPS state.
6			force clock TCLK_ZERO check when in clock lane HS mode.
5:3			TCLK_ZERO timing check. check with the hs clock counter. // 000: hs clock itself. // 001: hs clock /2 // 010: hs clock /4 // 011: hs clock /8 // 100: hs clock /16
2			Shut down digital data lane 2.

Bit(s)	R/W	Name	Description
1			force clock lane come out of ulps
0			force clock lane enter ULPS state.

**MIPI\_PHY\_DATA\_LANE\_CTRL 0x02**

Bit(s)	R/W	Name	Description
31			soft reset. set 1 will reset the MIPI phy cil_scnn and cil_sfen modules. set 0 will release the reset. it's level signal.
19:18			mipi hs clock to pad selection. //2'b00 : no output. //2'b01 : output /2 clock. //2'b10 : output /4 clock. //2'b11 : output /8 clock.
15			force data lane 3 THEN enable.
14			force data lane 3 LP receiver enable.
13			force data lane 3 HS receiver enable.
12			force data lane 3 terminator enable.
11			force data lane 2 THEN enable.
10			force data lane 2 LP receiver enable.
9			force data lane 2 HS receiver enable.
8			force data lane 2 terminator enable.
7			force data lane 1 THEN enable.
6			force data lane 1 LP receiver enable.
5			force data lane 1 HS receiver enable.
4			force data lane 1 terminator enable.
3			force data lane 0 THEN enable.
2			force data lane 0 LP receiver enable.
1			force data lane 0 HS receiver enable. // this bit is not used to control analog.
0			force data lane 0 terminator enable

**MIPI\_PHY\_DATA\_LANE\_CTRL1 0x03**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
12			LP data bit order.
11			HS data bit order. 2'b00. low bit input early.
9:7			data pipe sel. output data use with pipe line data.
6:2			these addition 5 pipe line to same the high speed data. //each bit for one pipe line.
1			if set enable the hs_sync error bit check.
0			for CSI2, only ULPS command accepted. if set this bit, all other command will insert the //ErrEsc signal.

**MIPI\_PHY\_TCLK\_MISS 0x04****MIPI\_PHY\_TCLK\_SETTLE 0x05****MIPI\_PHY\_THS\_EXIT 0x06****MIPI\_PHY\_THS\_SKIP 0x07****MIPI\_PHY\_THS\_SETTLE 0x08****MIPI\_PHY\_TINIT 0x09****MIPI\_PHY\_TULPS\_C 0x0a****MIPI\_PHY\_TULPS\_S 0x0b****MIPI\_PHY\_TMBIAS 0x0c**

How many cycles need to wait for analog MBIAS stable after MIPI\_MBIAS\_EN is inserted.

**MIPI\_PHY\_TLP\_EN\_W 0x0d**

How many cycles need to wait for analog LP receiver stable output after LPEN is inserted.

**MIPI\_PHY\_TLPOK 0x0e**

How many cycles need to wait for analog LP receiver stable output after LPEN is inserted.

**MIPI\_PHY\_TWD\_INIT 0x0f**

Watch dog for init.

**MIPI\_PHY\_TWD\_HS 0x10**

Watch dog for hs speed transfer

**MIPI\_PHY\_AN\_CTRL0 0x11****MIPI\_PHY\_AN\_CTRL1 0x12****MIPI\_PHY\_AN\_CTRL2 0x13****MIPI\_PHY\_CLK\_LANE\_STS 0x14**

Bit(s)	R/W	Name	Description
3:0			<p>clock lane states.</p> <p>// 4'h0 : Power_down state.</p> <p>// 4'h1 : POWER_UP state. //waiting for TINIT and MBIAS ready.</p> <p>// 4'h2 : INIT state //waiting the input to STOP.</p> <p>// 4'h3 : STOP state.</p> <p>// 4'h4 : ULPS request state. after receiver the ulps request, waiting everything settled.</p> <p>// 4'h5 : ULPS state.</p> <p>// 4'h6 : ULPS exit state. checked ULPS exit request and waiting for input in STOP.</p> <p>// 4'h7 : HS data transfer request state. LP = 2'b01:</p> <p>// 4'h8 : HS bridge state. LP = 2'b00:</p> <p>// 4'h9 : HS CLK ZERO state. enable the HS receiver in this stage the input clock is zero.</p> <p>// 4'ha : HS transfer state.</p> <p>// 4'hb : HS TRAIL state. if detected no clock edge , the state machine will try to go to stop state.</p>

**MIPI\_PHY\_DATA\_LANE0\_STS 0x15**

Bit(s)	R/W	Name	Description
6:4			<p>data lane 0 HS sub state. because this is across clock domain state. this is only for static debug.</p>
3:0			<p>data lane 0 state. //4'h0 : POWER_DOWN State.</p> <p>//4'h1 : POWER UP state.</p> <p>//4'h2 : INIT state.</p> <p>//4'h3 : STOP state.</p> <p>//4'h4 : HS REQUEST state.</p> <p>//4'h5 : HS PREPARE state.</p> <p>//4'h6 : HS transfer state.</p> <p>//4'h7 : HS exit state.</p> <p>//4'h8 : ESC request state.</p> <p>//4'h9 : ESC bridge 0 state.</p> <p>//4'ha : ESC bridge 1 state.</p> <p>//4'hb : ESC command state.</p> <p>//4'hc : ESC EXIT state.</p> <p>//4'hd : LP data transfer state.</p> <p>//4'he : ULPS state.</p> <p>//4'hf : ULPS exit state.</p>

**MIPI\_PHY\_DATA\_LANE1\_STS 0x16**

Bit(s)	R/W	Name	Description
6:4			data lane 0 HS sub state. because this is across clock domain state. this is only for static debug.
3:0			data lane 0 state.

**MIPI\_PHY\_DATA\_LANE2\_STS 0x17****MIPI\_PHY\_DATA\_LANE3\_STS 0x18****MIPI\_PHY\_ESC\_CMD 0x19****MIPI\_PHY\_INT\_CTRL 0x1a**

Bit(s)	R/W	Name	Description
24			read to clear the INT_STS. when this bit is set, read MIPI_PHY_INT_STS will clean all interrupt status bits.
18:0			each bit to enable related interrupt generate. if this bit is set, it will generate a interrupt to cpu when the interrupt source is triggered.otherwise only change the status bit.

**MIPI\_PHY\_INT\_STS 0x1b**

Bit(s)	R/W	Name	Description
27			data lane3 deskew done interrupt
26			data lane2 deskew done interrupt
25			data lane1 deskew done interrupt
24			data lane0 deskew done interrupt
23			data lane3 escape mode watch dog interrupt
22			data lane2 escape mode watch dog interrupt
21			data lane1 escape mode watch dog interrupt
20			data lane0 escape mode watch dog interrupt
18			clock lane ulps exit interupt
17			clock lane ulps enter interrupt
16			clock lane initilaztion watch dog interrupt.
15			data lane 3 initiliaztion watch dog interrupt.
14			data lane 2 initiliaztion watch dog interrupt.
13			data lane 1 initiliaztion watch dog interrupt.
12			data lane 0 initiliaztion watch dog interrupt.
11			data lane 3 HS transfer watch dog interrupt.

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
10			data lane 2 HS transfer watch dog interrupt.
9			data lane 1 HS transfer watch dog interrupt.
8			data lane 0 HS transfer watch dog interrupt.
7			data lane 3 HS transfer sync error interrupt.
6			data lane 2 HS transfer sync error interrupt.
5			data lane 1 HS transfer sync error interrupt.
4			data lane 0 HS transfer sync error interrupt.
3			data lane 3 ESC command ready interrupt.
2			data lane 2 ESC command ready interrupt.
1			data lane 1 ESC command ready interrupt.
0			data lane 0 ESC command ready interrupt.

**MIPI\_PHY\_ANA\_STS 0x1c****MIPI\_PHY\_DDR\_STS 0x1d****MIPI\_PHY\_TWD\_ESC 0x1e****MIPI\_PHY\_DESKEW\_CTRL 0x1f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
31			deskew enable
26			judges sync word 0xf8 to be potential deskew sync word. 0xf8 was considered to be 1bit error HS sync word
25			hardware auto judges the best phase for each lane, and set it to the analog
24			deskew hardware decision uses the best phase in data 55 or data AA. ideally, 0xAA is the right one, since the input sequence is 01010101, rising edge should sample 0
23:12			deskew window start, the statistic of byte data starts from this value
11:0			deskew window end, each analog phase will consumes the timing from 0 to window end

**MIPI\_PHY\_DESKEW\_L0\_55\_PHS10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
23:12	R/O		LANE0. the count of input byte which equals 0x55 in the window for phase 1
11:0	R/O		LANE0. the count of input byte which equals 0x55 in the window for phase 0

**MIPI\_PHY\_DESKEW\_L0\_55\_PHS32**

**MIPI\_PHY\_DESKEW\_PHS\_SEL**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
15:12	R/O		lane3, analog phase select by hardware
11:8	R/O		lane2, analog phase select by hardware
7:4	R/O		lane1, analog phase select by hardware
3:0	R/O		lane0, analog phase select by hardware

**MIPI\_PHY\_MUX\_CTRL0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
17:16			CK lane, 2'b00: select analog CK0, 2'b01: select analog CK1. 2'b10/11: input 0
14:12			SFEN0 input source. 3'b000: select analog data lane0, 3'b001: select analog data lane1. 3'b010: select analog data lane2. 3'b011: select analog data lane3. else, input 0
11:8			SFEN1 input source. 3'b000: select analog data lane0, 3'b001: select analog data lane1. 3'b010: select analog data lane2. 3'b011: select analog data lane3. else, input 0
7:4			SFEN2 input source. 3'b000: select analog data lane0, 3'b001: select analog data lane1. 3'b010: select analog data lane2. 3'b011: select analog data lane3. else, input 0
3:0			SFEN3 input source. 3'b000: select analog data lane0, 3'b001: select analog data lane1. 3'b010: select analog data lane2. 3'b011: select analog data lane3. else, input 0

**MIPI\_PHY\_MUX\_CTRL1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
17			Analog CK1 control signal input source: 1'b0: from D-PHY SCNN. 1'b1: input 0.
16			Analog CK0 control signal input source: 1'b0: from D-PHY SCNN. 1'b1: input 0.
14:12			Analog data lane 0 control signal input source: 3'b000: from SFEN0, 3'b001: from SFEN1, 3'b010: from SFEN2, 3'b011: from SFEN3. else input 0.
11:8			Analog data lane 1 control signal input source: 3'b000: from SFEN0, 3'b001: from SFEN1, 3'b010: from SFEN2, 3'b011: from SFEN3. else input 0.
7:4			Analog data lane 2 control signal input source: 3'b000: from SFEN0, 3'b001: from SFEN1, 3'b010: from SFEN2, 3'b011: from SFEN3. else input 0.
3:0			Analog data lane 3 control signal input source: 3'b000: from SFEN0, 3'b001: from SFEN1, 3'b010: from SFEN2, 3'b011: from SFEN3. else input 0.

**MIPI\_PHY\_DESKEW\_LEN\_LANE01**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
31:16	R/O		the deskew calibration length on lane0.
15:0	R/O		the deskew calibration length on lane1.

**MIPI\_PHY\_DESKEW\_LEN\_LANE23**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
31:16	R/O		the deskew calibration length on lane2.
15:0	R/O		the deskew calibration length on lane3.

Below are MIPI frontend based registers,

Frontend 0 base address: 0xFF654800

Frontend 1 base address: 0xFF654C00

Physical address = base address + offset \* 4

**CSI2\_CLK\_RESET**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R	0	Reserved
2	RW	0	clk_auto_gate_off: Enable/disable clock gating. 0=Enable auto clock gating for power saving; 1=Disable auto clock gating.
1	RW	0	clk_enable: To enable/disable clock to mipi_csi_adapt_frontend module. 0=Disable clock; 1=Enable clock.
0	RW	1	sw_reset: To reset mipi_csi_adapt_frontend module. 0=Release from reset; 1=Apply reset.

**CSI2\_GEN\_CTRL0**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:21	R	0	Reserved
20:16	RW	0x1f	enable_packets. [16] enable_raw. 1=Enable receive Raw data; 0=Ignore Raw data. [17] enable_yuv. 1=Enable receive YUV data; 0=Ignore YUV data. [18] enable_rgb. 1=Enable receive RGB data; 0=Ignore RGB data. [19] enable_embedded. 1=Enable receive Embedded data; 0=Ignore. [20] enable_user. 1=Enable receive User-define data; 0=Ignore User-define data.
15	R	0	Reserved
14	RW	0	buffer_ddr_wptr_other. 0=Reports the current ddr_wptr_other status; 1=Reports the buffered ddr_wptr_other status that was buffered at Frame_Start.
13	RW	0	ddr_64byte. HW uses it to calculate stride for Embedded or User-Defined address increment per line-end.

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			0=DDR is most efficient when address is 16-byte aligned; 1=DDR is most efficient when address is 64-byte aligned.
12	RW	0	ddr_wdone_mode. 0=After FrameEnd, assert interrupt when all previous writes are completed; 1=After (x_end_mem, y_end_mem) pixel are written to DDR, assert interrupt. However if somehow due to error, e.g. less lines are received, so that (x_end_mem, y_end_mem) never happens, then the interrupt will behave the same way as if cfg_ddr_wdone_mode=0 -- assert interrupt after FrameEnd, when all previous writes are completed.
11	RW	0	buffer_pic_size. Applicable only to direct path. 0=For active video size status, use non-buffered/instantaneous line/pixel count; 1=For active video size status, use line/pixel count that are buffered at end of field.
10	RW	0	use_null_packet. 0=Ignore Null packet; 1=Regard Null packet as one line.
9	RW	0	inv_field. Applicable only to interlace video to direct path. 0=first field is odd; 1=first field is even.
8	RW	0	interlace_en. Applicable only to direct path. 0=Progressive; 1=Interlace.
7	W	0	ddr_pingpong_init_set. Always read 0. Set to 1 when need to load ddr_pingpong_init_val into effect.
6	RW	0	ddr_pingpong_init_val. Only valid when ddr_pingpong_init_set=1. 0=Very 1st frame use start_addr; 1=Very 1st frame use start_addr_alt.
5	RW	0	ddr_pingpong_en. 0=DDR update with a new start_addr at every Frame_Start; 1=DDR set a pair of start_addr and start_addr_alt at INIT, and then DDR pointer will be ping-ponged at every Frame_Start.
4	RW	0	all_to_mem. 0=Depends on data type, some type might go to direct path, some might go to memory; 1>All data will go to memory, regardless of data type.
3:0	RW	0	virtual_channel_en: Enable one or more virtual channels at input. Bit[0] 1=Enable virtual channel 0, 0=Disable virtual channel 0; Bit[1] 1=Enable virtual channel 1, 0=Disable virtual channel 1; Bit[2] 1=Enable virtual channel 2, 0=Disable virtual channel 2; Bit[3] 1=Enable virtual channel 3, 0=Disable virtual channel 3;

**CSI2\_GEN\_CTRL1**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R	0	Reserved
7:6	RW	3	din_byte3_sel: Re-map the received 32-bit data's byte3. 0=Use input data's byte0 as actual byte3; 1=Use input data's byte1 as actual byte3; 2=Use input data's byte2 as actual byte3; 3=Use input data's byte3 as actual byte3.
5:4	RW	2	din_byte2_sel: Re-map the received 32-bit data's byte2. 0=Use input data's byte0 as actual byte2; 1=Use input data's byte1 as actual byte2; 2=Use input data's byte2 as actual byte2; 3=Use input data's byte3 as actual byte2.
3:2	RW	1	din_byte1_sel: Re-map the received 32-bit data's byte1. 0=Use input data's byte0 as actual byte1; 1=Use input data's byte1 as actual byte1; 2=Use input data's byte2 as actual byte1; 3=Use input data's byte3 as actual byte1.
1:0	RW	0	din_byte0_sel: Re-map the received 32-bit data's byte0. 0=Use input data's byte0 as actual byte0; 1=Use input data's byte1 as actual byte0; 2=Use input data's byte2 as actual byte0; 3=Use input data's byte3 as actual byte0.

**CSI2\_X\_START\_END\_ISP**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0xffff	x_end_isp. Applicable only to Raw data, direct ISP path.
15:0	RW	0	x_start_isp . Applicable only to Raw data, direct ISP path.

**CSI2\_Y\_START\_END\_ISP**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0xffff	y_end_isp. Applicable only to Raw data, direct ISP path.
15:0	RW	0	y_start_isp . Applicable only to Raw data, direct ISP path.

**CSI2\_X\_START\_END\_MEM**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0xffff	x_end_mem. Applicable only to Raw data, direct MEM path.
15:0	RW	0	x_start_mem. Applicable only to Raw data, MEM path.

**CSI2\_Y\_START\_END\_MEM**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0xffff	y_end_mem. Applicable only to Raw data, direct MEM path.
15:0	RW	0	y_start_mem. Applicable only to Raw data, MEM path.

**CSI2\_VC\_MODE**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	RW	0xf	hs_mem_sel_vc. The HS signal that goes to MEM path, is the logic operation of  (HS[all_4_channel_pre_reassign] & hs_mem_sel_vc[3:0]).
27:24	RW	0xf	vs_mem_sel_vc. The VS signal that goes to MEM path, is the logic operation of  (VS[all_4_channel_pre_reassign] & vs_mem_sel_vc[3:0]).
23:20	RW	0xf	hs_isp_sel_vc. The HS signal that goes to direct path, is the logic operation of  (HS[all_4_channel_pre_reassign] & hs_isp_sel_vc[3:0]).
19:16	RW	0xf	vs_isp_sel_vc. The VS signal that goes to direct path, is the logic operation of  (VS[all_4_channel_pre_reassign] & vs_isp_sel_vc[3:0]).
15:14	RW	0	vc_mode3[3]. Applicable only to Raw data.
13:12	RW	0	vc_mode3[2]. Applicable only to Raw data.
11:10	RW	0	vc_mode3[1]. Applicable only to Raw data.
9:8	RW	0	vc_mode3[0]. Applicable only to Raw data.
7:6	RW	0	vc_to_isp. Applicable only to Raw data. After VC re-assignment (if applicable), if the input data's VC==vc_to_isp, then the data go to direct path, otherwise it go to MEM path.
5:4	RW	0	vc_val1. Applicable only to Raw data.
3:2	RW	0	vc_val0. Applicable only to Raw data.
1:0	RW	0	assign_vc_mode. Applicable only to Raw data. 0=No virtual_channel re-assign. 1=Even line's VC=vc_val0, Odd line's VC=vc_val1. 2=If the first 64-bit (Payload   vc_mode2_match_mask)

Bit	R/W	Default	Description
			<p>== (vc_mode2_match_to_vc   vc_mode2_match_mask),  this line's VC=vc_val0;</p> <p>If the first 64-bit (Payload   vc_mode2_match_mask)  == (vc_mode2_match_to_ignore   vc_mode2_match_mask),  this line is to be ignored;</p> <p>Otherwise this line's VC=vc_val1.</p> <p>3=Reassign this line's VC to vc_mode3[VC].</p>

**CSI2\_VC\_MODE2\_MATCH\_MASK\_L**

Bit	R/W	Default	Description
31:0	RW	0	vc_mode2_match_mask[31:0]. Refer to assign_vc_mode.

**CSI2\_VC\_MODE2\_MATCH\_MASK\_H**

Bit	R/W	Default	Description
31:0	RW	0	vc_mode2_match_mask[63:32]. Refer to assign_vc_mode.

**CSI2\_VC\_MODE2\_MATCH\_TO\_VC\_L**

Bit	R/W	Default	Description
31:0	RW	0	vc_mode2_match_to_vc[31:0]. Refer to assign_vc_mode.

**CSI2\_VC\_MODE2\_MATCH\_TO\_VC\_H**

Bit	R/W	Default	Description
31:0	RW	0	vc_mode2_match_to_vc[63:32]. Refer to assign_vc_mode.

**CSI2\_VC\_MODE2\_MATCH\_TO\_IGNORE\_L**

Bit	R/W	Default	Description
31:0	RW	0	vc_mode2_match_to_ignore[31:0]. Refer to assign_vc_mode.

**CSI2\_VC\_MODE2\_MATCH\_TO\_IGNORE\_H**

Bit	R/W	Default	Description
31:0	RW	0	vc_mode2_match_to_ignore[63:32]. Refer to assign_vc_mode.

**CSI2\_DDR\_START\_PIX**

Bit	R/W	Default	Description
31:0	RW	0	DDR start address for pixel-based data (Raw/RGB/YUV). Must be 16-byte aligned, so low 4-bit will be ignored.

**CSI2\_DDR\_START\_PIX\_ALT**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	Alternative DDR start address for pixel-based data (Raw/RGB/YUV). Refer to ddr_pingpong_en. Must be 16-byte aligned, so low 4-bit will be ignored.

**CSI2\_DDR\_START\_OTHER**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	DDR start address for non-pixel-based data (Embedded or User-defined). Must be 16-byte aligned, so low 4-bit will be ignored.

**CSI2\_DDR\_START\_OTHER\_ALT**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	Alternative DDR start address for non-pixel-based data (Embedded or User-defined). Refer to ddr_pingpong_en. Must be 16-byte aligned, so low 4-bit will be ignored.

**CSI2\_DDR\_MAX\_BYTES\_OTHER**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	Maximum bytes allocated to DDR for storing non-pixel-based data (Embedded or User-defined).

Note: About reading Embedded or User-defined packets from DDR

The first packet starts from CSI2\_DDR\_START\_OTHER(\_ALT).

Byte0={virtual\_channel[1:0],data\_type[5:0]};

Byte1=word\_count[7:0];

Byte2=word\_count[15:8];

The rest of the bytes are packet payload bytes, total bytes of payload is word\_count, with lowest byte first, highest byte last.

SW calculates where to read the next packet, (if there is any):

new\_packet\_start\_addr = last\_packet\_start\_addr + (((last\_packet\_word\_count+3)+M-1)/M)\*M

Where M is defined by CSI2\_GEN\_CTRL0's bit[13] -- ddr\_64byte. If cfg\_ddr\_64byte=0, M=16; if ddr\_64byte=1, M=64.

If the new\_packet\_start\_addr >= the value read from CSI2\_DDR\_WPTR\_STAT\_OTHER. Then there is no more packets. Do not read the content starting from new\_packet\_start\_addr.

CSI2\_DDR\_WPTR\_STAT\_OTHER's value can be current address pointer or previous address pointer buffered by Frame\_Start.

**CSI2\_INTERRUPT\_CTRL\_STAT**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:21	R	0	Reserved
20:16	RW	0	interrupt status/clear. [16] vs_rise_isp sticky status, write 1 to clear it;

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			[17] vs_fall_isp sticky status, write 1 to clear it; [18] ddr_wdone sticky status, write 1 to clear it; [19] vs_rise_mem sticky status, write 1 to clear it; [20] vs_fall_mem sticky status, write 1 to clear it.
15:5	R	0	Reserved
4:0	RW	0	interrupt_sel. Enable one or more interrupts. [0]=1 to enable vs_rise_isp interrupt; [1]=1 to enable vs_fall_isp interrupt; [2]=1 to enable ddr_wdone interrupt; [3]=1 to enable vs_rise_mem interrupt; [4]=1 to enable vs_fall_mem interrupt.

**CSI2\_GEN\_STAT0**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R	0	Reserved
9	R	0	afifo_nempty.
8	R	0	afifo_full.
7:6	R	0	Reserved
5:0	R	0	afifo_count. The counter of async FIFO at input.

**CSI2\_ERR\_STAT0**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:13	R	0	Reserved
12	R	0	err_addr_other_overfl
11	R	0	err_axi_overdue
10	R	0	err_bfifo_underfl
9	R	0	err_bfifo_overfl
8	R	0	err_axi_bresp
7	R	0	err_axi_bresp_extra
6	R	0	err_wfifo_underfl
5	R	0	err_wfifo_overfl
4	R	0	err_awfifo_underfl
3	R	0	err_awfifo_overfl
2	R	0	err_afifo_ovfl
1	R	0	err_wc_ovfl
0	R	0	err_wc_unfl

**CSI2\_PIC\_SIZE\_STAT**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R	0	line_count measure for direct path only. Maybe buffered or non-buffered, depends on buffer_pic_size.
15:0	R	0	pix_count measure for direct path only. Maybe buffered or non-buffered, depends on buffer_pic_size.

**CSI2\_DDR\_WPTR\_STAT\_PIX**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R	0	Memory pointer for pixel lines. Always current status.

**CSI2\_DDR\_WPTR\_STAT\_OTHER**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R	0	Memory pointer for non-pixel lines. Can be buffered or current status depending on buffer_ddr_wptr_other.

**CSI2\_STAT\_MEM\_0**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R	0	Reserved
19:10	R	0	wfifo_count.
9	R	0	axi_w_state. 0=AXI_W_IDLE; 1=AXI_W_WAIT_READY
8:2	R	0	awfifo_cnt.
1:0	R	0	axi_aw_state. 0=AXI_AW_IDLE; 1= AXI_AW_WAIT_READY; 2= AXI_AW_WAIT_W.

**CSI2\_STAT\_MEM\_1**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R	0	aw_pending_cnt.
15:0	R	0	y_pos. Current line number, for RAW data only.

**CSI2\_STAT\_GEN\_SHORT\_08**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x08) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x08).
15:0	R	0	Received General Short Packet (type=0x08).

**CSI2\_STAT\_GEN\_SHORT\_09**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x09) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x09).
15:0	R	0	Recevied General Short Packet (type=0x09).

**CSI2\_STAT\_GEN\_SHORT\_0A**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x0A) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x0A).
15:0	R	0	Recevied General Short Packet (type=0x0A).

**CSI2\_STAT\_GEN\_SHORT\_0B**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x0B) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x0B).
15:0	R	0	Recevied General Short Packet (type=0x0B).

**CSI2\_STAT\_GEN\_SHORT\_0C**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x0C) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x0C).
15:0	R	0	Recevied General Short Packet (type=0x0C).

**CSI2\_STAT\_GEN\_SHORT\_0D**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x0D) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x0D).
15:0	R	0	Received General Short Packet (type=0x0D).

**CSI2\_STAT\_GEN\_SHORT\_0E**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x0E) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x0E).
15:0	R	0	Received General Short Packet (type=0x0E).

**CSI2\_STAT\_GEN\_SHORT\_0F**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0	General Short Packet (type=0x0F) receive flag. The flag will be cleared once the register is read. 0=Not received; 1=Received new packet.
17:16	R	0	Virtual Channel for General Short Packet (type=0x0F).
15:0	R	0	Received General Short Packet (type=0x0F).

Below are DDR RD registers.

base address: 0xFF655000

Physical address = base address + offset \* 4

**MIPI\_ADAPT\_DDR\_RD0\_CNTL0 0x00**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	frame_rd_start start read frame data from ddr, used in single frame read scenario, this bit is self-cleared
30	RW	0x0	port_sel

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			0: direct path mode, data from direct path input 1: ddr mode, data from ddr
29:28	RW	0x0	burst_type burst type for AXI read command 0: single 1: incr2 2: incr4 3: inrc8
27:26	RW	0x0	reg_sample_sel By default, control register will be latched from apb clk domain to vclk domain by enable and soft_load, you can use the following signal to latch the control register too 0: at posedge of frame_rd_start 1: vsync from frontend 2: delayed vsync from frontend 3: reserved
25	RW	0x0	soft_load control register will be latched from apb clk domain to vclk domain at posedge of soft_load
24	RW	0x0	continue_mode Used in ddr mode, if this bit is high, continuous frames will be read from ddr without any software control in every vblank period 0: single frame scenario 1: multiple frame scenario
23	RW	0x0	dol_mode 0: single exposure mode 1: DOL mode for HDR, 2-exposure mode
22	RW	0x0	pingpong_mode This bit is used for frame base address control. 0: frame_base_address_0 is used 1: frame_base_address_0 and frame_base_address_1 are used alternately
21	RW	0x0	dol_time_out_en Enable for the timeout control in DOL mode. 0: disable 1: enable
20	RW	0x0	frame_wr_done_sel When frontend module has written the whole frame data to ddr, it will send a flag to ddr_rd module. This is the flag source select control. 0: flag from frontend 0

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			1: flag from frontend 1
19	RW	0x0	<p>line_wr_done_sel</p> <p>When frontend module has written the whole line data to ddr, it will send a flag to ddr_rd module. This is the flag source select control.</p> <p>0: flag from frontend 0</p> <p>1: flag from frontend 1</p>
18	RW	0x0	<p>dol_frame_end_en</p> <p>Enable ddr_rd module read the missing lines when frontend module write less lines than expectation, only used in DOL mode</p>
17	RW	0x0	<p>dol_vblank_clr_sel</p> <p>In DOL mode, vblank flag is set by frame write done flag from frontend module, and clear by the following signal:</p> <p>0: ddr_rd has read all the lines from ddr for a frame</p> <p>1: vsync from frontend module</p>
16	RW	0x0	<p>din_vs_sel</p> <p>Vsync source select</p> <p>0:from frontend 1</p> <p>1:from frontend 0</p>
15:4	RW	0x0	<p>din_vs_dly_cnt</p> <p>Vsync from frontend will be delayed internally, this is the delay time setting in vck cycle</p>
3:2	RW	0x0	<p>lbuf_soft_rst_sel</p> <p>Line buffer 0 soft reset source select</p> <p>0: reserved</p> <p>1: vsync from frontend 0</p> <p>2: vsync from frontend 1</p> <p>3: delayed vsync</p>
0	RW	0x0	Module enable for ddr_rd

**MIPI\_ADAPT\_DDR\_RD0\_CNTL1 0x01**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	<p>line_number</p> <p>Line number in a frame, when N ,set N</p>
15:12	RW	0x0	<p>dol_line_threshold</p> <p>In DOL mode, ddr_rd start to read frame data from ddr when frontend module has written "dol_line_threshold" lines into ddr</p>
9:0	RW	0x0	<p>line_size</p> <p>Data size for a line, unit: 128bit</p>

**MIPI\_ADAPT\_DDR\_RD0\_CNTL2 0x02**

Bit(s)	R/W	Default	Description
31:0	RW	0x0	frame_base_address_0 Base address 0 for frame data

**MIPI\_ADAPT\_DDR\_RD0\_CNTL3 0x03**

Bit(s)	R/W	Default	Description
31:0	RW	0x0	frame_base_address_1 Base address 1 for frame data, valid in pingpong mode

**MIPI\_ADAPT\_DDR\_RD0\_CNTL4 0x04**

Bit(s)	R/W	Default	Description
31:13	RW	0x0	dol_time_out Set the IDLE period in vck cycle for frontend-ddr_rd interface to set the time out flag, valid in DOL mode
12:0	RW	0x0	line_threshold line number threshold for interrupt, when ddr_rd has read "line_threshold" lines, it will send out an interrupt flag

**MIPI\_ADAPT\_DDR\_RD0\_ST0 0x05**

Bit(s)	R/W	Default	Description
18	R	0x0	pixel_line_valid Valid line period for direct path
17:8	R	0x0	lbuf_counter Valid data number in line buffer
7:4	R	0x0	fe_frame_wr_counter Frame numbers present in DDR for read
3	R	0x0	lbuf_not_full full flag for line buffer 0: full 1: not full
2:0	R	0x0	ddr_rd_state Internal FSM state for ddr read control

**MIPI\_ADAPT\_DDR\_RD0\_ST1 0x06**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0x0	frame_base_address_sel Indicate which base address is used for current frame 0: frame_base_address_0 1: frame_base_address_1
28:16	R	0x0	v_counter Line number that has been read from ddr for a frame
9:0	R	0x0	line_count data number that has been read from ddr for a line

**MIPI\_ADAPT\_DDR\_RD0\_ST2 0x07**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29	R	0x0	fe_line_wr_done_mask Indicate frontend has written more lines than expectation to ddr for a frame
28:16	R	0x0	fe_line_wr_counter Valid Line number present in ddr, valid in DOL mode
13	R	0x0	dol_timeout_valid Time out flag in DOL mode
12:0	R	0x0	dol_frame_line_cnt Line number that frontend has written to ddr, valid in DOL mode

**MIPI\_ADAPT\_DDR\_RD1\_CNTL0 0x10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	frame_rd_start start read frame data from ddr, used in single frame read scenario, this bit is self-cleared
30	RW	0x0	port_sel 0: direct path mode, data from direct path input 1: ddr mode, data from ddr
29:28	RW	0x0	burst_type burst type for AXI read command 0: single 1: incr2 2: incr4 3: inrc8
27:26	RW	0x0	reg_sample_sel

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			<p>By default, control register will be latched from apb clk domain to vclk domain by enable and soft_load, you can use the following signal to latch the control register too</p> <p>0: at posedge of frame_rd_start 1: vsync from frontend 2: delayed vsync from frontend 3: reserved</p>
25	RW	0x0	<p>soft_load</p> <p>control register will be latched from apb clk domain to vclk domain at posedge of soft_load</p>
24	RW	0x0	<p>continue_mode</p> <p>Used in ddr mode, if this bit is high, continuous frames will be read from ddr without any software control in every vblank period</p> <p>0: single frame scenario 1: multiple frame scenario</p>
23	RW	0x0	<p>dol_mode</p> <p>0: single exposure mode 1: DOL mode for HDR, 2-exposure mode</p>

20	RW	0x0	<p>frame_wr_done_sel</p> <p>When frontend module has written the whole frame data to ddr, it will send a flag to ddr_rd module. This is the flag source select control.</p> <p>0: flag from frontend 0 1: flag from frontend 1</p>
19	RW	0x0	<p>line_wr_done_sel</p> <p>When frontend module has written the whole line data to ddr, it will send a flag to ddr_rd module. This is the flag source select control.</p> <p>0: flag from frontend 0 1: flag from frontend 1</p>
18	RW	0x0	<p>dol_frame_end_en</p> <p>Enable ddr_rd module read the missing lines when frontend module write less lines than exception, only used in DOL mode</p>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
17	RW	0x0	dol_vblank_clr_sel In DOL mode, vblank flag is set by frame write done flag from frontend module, and clear by the following signal: 0: ddr_rd has read all the lines from ddr for a frame 1: vsync from frontend module
16	RW	0x0	din_vs_sel Vsync source select 0:from frontend 1 1:from frontend 0
15:4	RW	0x0	din_vs_dly_cnt Vsync from frontend will be delayed internally, this is the delay time setting in vck cycle
3:2	RW	0x0	lbuf_soft_rst_sel Line buffer 0 soft reset source select 0: reserved 1: vsync from frontend 1 2: vsync from frontend 0 3: delayed vsync
0	RW	0x0	Module enable for ddr_rd

**MIPI\_ADAPT\_DDR\_RD1\_CNTL1 0x11**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	line_number Line number in a frame,when N ,set N
15:12	RW	0x0	dol_line_threshold In DOL mode, ddr_rd start to read frame data from ddr when frontend module has written "dol_line_threshold" lines into ddr
9:0	RW	0x0	line_size Data size for a line, unit: 128bit

**MIPI\_ADAPT\_DDR\_RD1\_CNTL2 0x12**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0x0	frame_base_address_0 Base address 0 for frame data

**MIPI\_ADAPT\_DDR\_RD1\_CNTL3 0x13**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0x0	frame_base_address_1 Base address 1 for frame data, valid in pingpong mode

**MIPI\_ADAPT\_DDR\_RD1\_CNTL4 0x14**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:13	RW	0x0	dol_time_out Set the IDLE period in vck cycle for frontend-ddr_rd interface to set the time out flag, valid in DOL mode
12:0	RW	0x0	line_threshold line number threshold for interrupt, when ddr_rd has read "line_threshold" lines, it will send out an interrupt flag

**MIPI\_ADAPT\_DDR\_RD1\_ST0 0x15**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18	R	0x0	pixel_line_valid Valid line period for direct path
17:8	R	0x0	lbuf_counter Valid data number in line buffer
7:4	R	0x0	fe_frame_wr_counter Frame numbers present in DDR for read
3	R	0x0	lbuf_not_full full flag for line buffer 0: full 1: not full
2:0	R	0x0	ddr_rd_state Internal FSM state for ddr read control

**MIPI\_ADAPT\_DDR\_RD1\_ST1 0x16**

Bit(s)	R/W	Default	Description
31	R	0x0	frame_base_address_sel Indicate which base address is used for current frame 0: frame_base_address_0 1: frame_base_address_1
28:16	R	0x0	v_counter Line number that has been read from ddr for a frame
9:0	R	0x0	line_count data number that has been read from ddr for a line

**MIPI\_ADAPT\_DDR\_RD1\_ST2 0x17**

Bit(s)	R/W	Default	Description
29	R	0x0	fe_line_wr_done_mask Indicate frontend has written more lines than expectation to ddr for a frame
28:16	R	0x0	fe_line_wr_counter Valid Line number present in ddr, valid in DOL mode
13	R	0x0	dol_timeout_valid Time out flag in DOL mode
12:0	R	0x0	dol_frame_line_cnt Line number that frontend has written to ddr, valid in DOL mode

Below are pixel registers.

base address: 0xFF655000

Physical address = base address + offset \* 4

**MIPI\_ADAPT\_PIXEL0\_CNTL0 0x20**

Bit(s)	R/W	Default	Description
31	RW	0x0	data_mode 0 ddr mode 1 direct mode
30	RW	0x0	sf_fifo_rd_size_en 0:sf_fifo_rd_size invalid, will auto calculate fifo_rd_size by data_type and pixel_num 1:sf_fifo_rd_size valid, will use sf_fifo_rd_size as fifo_rd_size
25:16	RW	0x0	sf_fifo_rd_size Fifo rd data number from fifo for each line configured by software, valid when sf_fifo_rd_size_en = 1 The number of data should be N x 128bit

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:13	RW	0x0	<p>data_type Input video data format</p> <p>1 RAW6 2 RAW7 3 RAW8 4 RAW10 5 RAW12 6 RAW14</p>
12:0	RW	0x0	<p>pixel_num Pixel number in a line (Set N when N pixel per line)</p>

**MIPI\_ADAPT\_PIXEL0\_CNTL1 0x21**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	<p>start_en Start enable, write 1 to start, will auto clear to 0</p>
30:16	RW	0x0	<p>frame_sync_dely_time Frame_sync delay time, N x vclk cycles, valid when frame_sync_dely_en = 1</p>
15	RW	0x0	<p>frame_sync_dely_en Can use frame_sync from frontend after delay some cycles of vclk 0 Frame_sync delay disable 1 Frame_sync delay enable</p>
12	RW	0x0	<p>frame_sync_sel 0 frame_sync from frontend0 1 frame_sync from frontend1</p>
11	RW	0x0	<p>frame_sync_en Can use frame_sync from frontend to soft reset pixel model 0 frame_sync disable 1 frame_sync enable, will sync and reload register when frame_sync valid</p>
9:0	RW	0x0	<p>fifo_threshold pixel will start read fifo after fifo depth &gt; threshold</p>

**MIPI\_ADAPT\_PIXEL1\_CNTL0 0x22**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	<p>data_mode 0 ddr mode 1 direct mode</p>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30	RW	0x0	sf_fifo_rd_size_en 0:sf_fifo_rd_size unvalid,will auto calculate fifo_rd_size by data_type and pixel_num 1:sf_fifo_rd_size valid,will use sf_fifo_rd_size as fifo_rd_size
25:16	RW	0x0	sf_fifo_rd_size Fifo rd data number from fifo for each line configured by software,valid when sf_fifo_rd_size_en = 1 The number of data should be N x 128bit
15:13	RW	0x0	data_type Input video data format 1 RAW6 2 RAW7 3 RAW8 4 RAW10 5 RAW12 6 RAW14
12:0	RW	0x0	pixel_num Pixel number in a line (Set N when N pixel per line)

**MIPI\_ADAPT\_PIXEL1\_CNTL1 0x23**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	start_en Start enable, write 1 to start ,will auto clear to 0
30:16	RW	0x0	frame_sync_dely_time Frame_sync delay time,N x vclk cycles,valid when frame_sync_dely_en = 1
15	RW	0x0	frame_sync_dely_en Can use frame_sync from frontend after delay some cycles of vclk 0 Frame_sync delay disable 1 Frame_sync delay enable
12	RW	0x0	frame_sync_sel 0 frame_sync from frontend0 1 frame_sync from frontend1
11	RW	0x0	frame_sync_en Can use frame_sync from frontend to soft reset pixel model 0 frame_sync disable 1 frame_sync enable, will sync and reload register when frame_sync valid
9:0	RW	0x0	fifo_threshold pixel will start read fifo after fifo depth > threshold

Below are Alignment registers.

base address: 0xFF655000

Physical address = base address + offset \* 4

**MIPI\_ADAPT\_ALIG\_CNTL0 0x30**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	h_num_a For camera A,H total in a line,when N, set N
12:0	RW	0x0	v_num_a For camera A,V total in a frame,when N, set N

**MIPI\_ADAPT\_ALIG\_CNTL1 0x31**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	hps_num_a For camera A, Start pixel in a line, when N, set N
12:0	RW	0x0	hpe_num_a For camera A, End pixel in a line, when N, set N+1

**MIPI\_ADAPT\_ALIG\_CNTL2 0x32**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	vps_num_a For camera A,Start line in a frame,when N,set N
12:0	RW	0x0	vpe_num_a For camera A,End line in a frame,when N,set N+1

**MIPI\_ADAPT\_ALIG\_CNTL3 0x33**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	h_num_b For camera B,H total in a line,when N,set N
12:0	RW	0x0	v_num_b For camera B,V total in a frame,when N,set N

**MIPI\_ADAPT\_ALIG\_CNTL4 0x34**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	hps_num_b For camera B,Start pixel in a line,when N,set N
12:0	RW	0x0	hpe_num_b For camera B,End pixel in a line,when N,set N+1

**MIPI\_ADAPT\_ALIG\_CNTL5 0x35**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	RW	0x0	vps_num_b For camera B,Start line in a frame,when N,set N
12:0	RW	0x0	vpe_num_b For camera B,End line in a frame,when N,set N+1

**MIPI\_ADAPT\_ALIG\_CNTL6 0x36**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:16	RW	0x0	fill_data Fill data value when less line or less pixel in direct path,will use this value to fill the missing pixel
15	RW	0x0	vdata3_en 0:vdata3 disable 1:vdata3 enable
14	RW	0x0	vdata2_en

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			0:vdata2 disable 1:vdata2 enable
13	RW	0x0	vdata1_en 0:vdata1 disable 1:vdata1 enable
12	RW	0x0	vdata0_en 0:vdata0 disable 1:vdata0 enable
11	RW	0x0	vdata3_sel When camera_mode = 1, this bit replaced by camera_sel When camera_mode = 0, vdata3 select 0:lane0 data 1:lane1 data
10	RW	0x0	vdata2_sel When camera_mode = 1, this bit replaced by camera_sel When camera_mode = 0, vdata2 select 0:lane0 data 1:lane1 data
9	RW	0x0	vdata1_sel When camera_mode = 1, this bit replaced by camera_sel When camera_mode = 0, vdata1 select 0:lane0 data 1:lane1 data
8	RW	0x0	vdata0_sel When camera_mode = 1, this bit replaced by camera_sel When camera_mode = 0, vdata0 select 0:lane0 data 1:lane1 data
5	RW	0x0	pix_datemode_1 Pixel 1 data mode 0 ddr mode 1 direct mode
4	RW	0x0	pix_datemode_0 Pixel 0 data mode 0 ddr mode 1 direct mode
3	RW	0x0	lane1_sel

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			Lane1 input source select 0 pixel 0 1 pixel 1
2	RW	0x0	lane1_en 0 lane1 disable 1 lane1 enable When camera_mode =1,camera_sel should set to 1 to make lane1 enable
1	RW	0x0	lane0_sel Lane0 input source select 0 pixel 0 1 pixel 1
0	RW	0x0	lane0_en 0 lane0 disable 1 lane0 enable When camera_mode =1,camera_sel should set to 0 to make lane0 enable

**MIPI\_ADAPT\_ALIG\_CNTL7 0x37**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0x0	inc_mask_timeout When inc_mask_timeout_en = 1,those bits are valid will be timeout after when no valid data with direct mode in vvalid period after N x vclk cycles
15	RW	0x0	inc_mask_timeout_en 0:in_mask timeout disable 1:in_mask timeout enable
13	RW	0x0	frame_sync_en Can use frame_sycn from frontend to do soft reset for this model,and can reset the start line and start pixel to certain line and certain pixel 0 frame_sync disable 1 frame_sync enable
13	RW	0x0	frame_sync_sel frame_sync source select 0 frame_sync from frontend0 1 frame_sync from frontend1
12:0	RW	0x0	frame_start_line Will valid ,When frame_sync_en =1 Can start at N line of frame at the time of frame_sync

Bit(s)	R/W	Default	Description
			Should not greater than the vps_num(first valid line position)

**MIPI\_ADAPT\_ALIG\_CNTL8 0x38**

Bit(s)	R/W	Default	Description
31	RW	0x0	start_en Alignment start enable, will auto clear to 0
28:16	RW	0x0	frame_start_pixel Will valid , When frame_sync_en =1 Can start at N pixel of frame_start_line at the time of frame_sync Should be less than the h_num(h total)
13	RW	0x0	no_frame_sv_sync_en When frame_sync_en =0, can start frame at frame_start_line and frame_start_pixel after counter equal h_num and v_num
12	RW	0x0	exc_mask_dis When in direct mode pixel or line is received is more than setting, and the inc_mask_timeout_en is valid, will treat it as pixel or line exceed, can select stop counter or not stop counter until received the lineend/frameend information. 0 hold counter when pixel or line exceed 1 not hold counter when pixel or line exceed
11	RW	0x0	mult_camera_req_sf_en 0 mult_camera_req_sf disable 1 mult_camera_req_sf enable
10	RW	0x0	mult_camera_req_sf ISP in mult camera mode will output isp_multictx_frame_req, we should start transmit when isp_multictx_frame_req. But we can use this register instant of isp_multictx_frame_req when mult_camera_req_sf_en = 1
9	RW	0x0	camera_mode 0 single camera mode 1 dual camera mode
8	RW	0x0	camera_sel When camera_mode =1, camera_sel should set to 1 to make lane1 enable When camera_mode =1, camera_sel should set to 0 to make lane0 enable 0 select camera A 1 select camera B
5	RW	0x0	frame_continue 0 disable continue mode, should set start_en each frame 1 enable continue mode, will auto start the next frame transmit

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
4	RW	0x0	<p>fr_vdata_rrdy_dis</p> <p>fr_vdata_rrdy is the ready single from swrmif, will valid when swrmif can not receive more data from isp. When fr_vdata_rrdy is valid, alignment will desert cke to hold ISP.</p> <p>0 fr_vdata_rrdy valid</p> <p>1 fr_vdata_rrdy invalid</p>
1:0	RW	0x0	<p>frame_vs_sel</p> <p>Alignment will send out a frame_vs single to swrmif for sync.</p> <p>frame_vs to swrmif select</p> <p>0 frame_sync</p> <p>1 frame start by auto count</p> <p>2 frame_sync before delay</p> <p>3 frame end by auto count</p>

**MIPI\_ADAPT\_ALIG\_CNTL9 0x39**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	<p>frame_sync_dely_en</p> <p>Can use frame_sync from frontend after delay some cycles of vclk</p> <p>0 Frame_sync delay disable</p> <p>1 Frame_sync delay enable</p>
30:16	RW	0x0	<p>frame_sync_dely_time</p> <p>Frame_sync delay time, N x vclk cycles, valid when frame_sync_dely_en = 1</p>

Below are MISC registers.

base address: 0xFF655000

Physical address = base address + offset \* 4

**MIPI\_OTHER\_CNTL0 0x40**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	RW	0x0	<p>reg_soft_rst</p> <p>Can use register to soft reset those modules:</p> <p>bit 3 : lbuf0,lbuf1,pixel0,pixel1,alignment</p> <p>bit 2 : alignment</p> <p>bit 1 : ddr_rd1,lbuf1,pixel1</p> <p>bit 0 : ddr_rd0,lbuf0,pixel0</p>
17	RW	0x0	<p>reg_lbuf1_clk_on</p> <p>0 : lbuf1 clock gate disable</p> <p>1 : lbuf1 clock gate enable</p>
16	RW	0x0	reg_lbuf0_clk_on

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			0 :lbuf0 clock gate disable 1 :lbuf0 clock gate enable
15:14	RW	0x0	reg_gclk_ctrl_mipi_axi_arb for axi arb
12:4	RW	0x0	reg_ugt_cntl Axi arbit ugt can set by software Bit8 :sc_wrmif axi write Bit7 :isp temper axi write Bit6 :isp ds axi write Bit5 :isp fr axi write Bit4 :frontend1 axi write Bit3 :frontend0 axi write Bit2 :isp temper axi read Bit1 :ddr_rd1 axi read Bit0 :ddr_rd0 axi read

**MIPI\_OTHER\_CNTL1 0x41**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	cmd_mask_en ddr_rd0 axi read cmd bus can be hold intermittent by this bit to reduce the bandwidth loading 0 : disable 1 : enable
15:8	RW	0x0	cmd_number When cmd_mask_en = 1,will hold ddr_rd0 axi read cmd bus after send those number of read cmd
7:0	RW	0x0	cmd_block_cycle When cmd_mask_en =1,after the number of read cmd equal cmd_number will hold the cmd bus for cmd_block_cycle cycles of vclk.

**MIPI\_OTHER\_CNTL2 0x42**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	cmd_mask_en ddr_rd1 axi read cmd bus can be hold intermittent by this bit to reduce the bandwidth loading 2 : disable 3 : enable
15:8	RW	0x0	cmd_number

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			When cmd_mask_en = 1, will hold ddr_rd0 axi read cmd bus after send those number of read cmd
7:0	RW	0x0	cmd_block_cycle When cmd_mask_en = 1, after the number of read cmd equal cmd_number will hold the cmd bus for cmd_block_cycle cycles of vclk.

**MIPI\_OTHER\_CNTL3 0x43**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	noblock_en Isp ds axi wrbus can not wait bresp when this bit set 0: disable 1: enable
30	RW	0x0	soft_rst ds_noblock soft_rst, write 1 to reset ds_noblock module
29	RW	0x0	cmd_cnt_clr Set cmd_cnt to 0, cmd_cnt used to count the number of cmd have not receive bresp from bus
18:16	RW	0x0	frame_sync_sel Check cmd_cnt equal 0 at frame_sync 5 : isp_vvalid_neg 4 : isp_vvalid_pos 3 : frame_vs (from alignment) 2 : frontend1_vs 1 : frontend0_vs 0 : disable
15	RW	0x0	frame_sync_dely_en 0 : frame_sync delay disable 1 : frame_sync delay enable
14:0	RW	0x0	frame_sync_dely_time frame_sync delay time, N x vclk cycles, valid when frame_sync_dely_en = 1

**MIPI\_OTHER\_CNTL4 0x44**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0x0	noblock_en Isp fr axi wrbus can not wait bresp when this bit set 0: disable 1: enable

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30	RW	0x0	soft_rst fr_noblock soft_rst, write 1 to reset fr_noblock module
29	RW	0x0	cmd_cnt_clr Set cmd_cnt to 0, cmd_cnt used to count the number of cmd have not receive bresp from bus
18:16	RW	0x0	frame_sync_sel Check cmd_cnt equal 0 at frame_sync 5 : isp_vvalid_neg 5 : isp_vvalid_pos 4 : frame_vs (from alignment) 3 : frontend1_vs 2 : frontend0_vs 0 : disable
15	RW	0x0	frame_sync_dely_en 0 : frame_sync delay disable 1 : frame_sync delay enable
14:0	RW	0x0	frame_sync_dely_time frame_sync delay time, N x vclk cycles, valid when frame_sync_dely_en = 1

**MIPI\_OTHER\_ST0 0x4a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R	0x0	cmd_cnt in ds axi wrbus noblock module

**MIPI\_OTHER\_ST1 0x4b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R	0x0	cmd_cnt in fr axi wrbus noblock module

**DDR\_RD0\_LBUF\_STATUS 0x50**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
14	R	0x0	ddr_rd_0_lbuf_overflow
13	R	0x0	ddr_rd_0_lbuf_underflow
12	R	0x0	ddr_rd_0_lbuf_full
11	R	0x0	ddr_rd_0_lbuf_halffull
10	R	0x0	ddr_rd_0_lbuf_empty
9:0	R	0x0	ddr_rd_0_lbuf_count

**DDR\_RD1\_LBUF\_STATUS 0x51**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
14	R	0x0	ddr_rd_0_lbuf_overflow
13	R	0x0	ddr_rd_0_lbuf_underflow
12	R	0x0	ddr_rd_0_lbuf_full
11	R	0x0	ddr_rd_0_lbuf_halffull
10	R	0x0	ddr_rd_0_lbuf_empty
9:0	R	0x0	ddr_rd_0_lbuf_count

**MIPI\_ADAPT\_IRQ\_MASK0 0x60**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30:0	RW	0x0	Irq_mask, set 1 to each bit to enable the pending in MIPI_ADAPT_IRQ_PENDING0 as interrupt

**MIPI\_ADAPT\_IRQ\_PENDING0 0x61**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30	RW	0x0	ddr_rd1_dol_more_line_pending When ddr_rd in dol mode and with ddr mode, will set this pending when ddr_rd received more lines than the setting for ddr_rd1
29	RW	0x0	ddr_rd1_dol_less_line_pending When ddr_rd in dol mode and with ddr mode, will set this pending at 2 cases: 1 ddr_rd received the next frame_vsync and the number of lines is less than the setting for ddr_rd1 2 when set dol_time_out_en=1, and ddr_rd did not receive valid line in the setting time period for ddr_rd1
28	RW	0x0	ddr_rd_1_lbuf_wr_ov_pending When lbuf1 overflow will set this pending
27	RW	0x0	ddr_rd_0_lbuf_wr_ov_pending When lbuf0 overflow will set this pending
26	RW	0x0	fe_1_pending[4]:frame_end_mem frame end for ddr mode data in frontend1
25	RW	0x0	fe_1_pending[3]:frame_start_mem frame start for ddr mode data in frontend1
24	RW	0x0	fe_1_pending[2]:ddr_wdone frame ddr data have been write to ddr by frontend1
23	RW	0x0	fe_1_pending[1]:frame_end_isp frame end for direct mode data in frontend1

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
22	RW	0x0	fe_1_pending[0]:frame_start_isp frame start for direct mode data in frontend1
21	RW	0x0	fe_0_pending[4]:frame_end_mem frame end for ddr mode data in frontend0
20	RW	0x0	fe_0_pending[3]:frame_start_mem frame start for ddr mode data in frontend0
19	RW	0x0	fe_0_pending[2]:ddr_wdone frame ddr data have been write to ddr by frontend0
18	RW	0x0	fe_0_pending[1]:frame_end_isp frame end for direct mode data in frontend0
17	RW	0x0	fe_0_pending[0]:frame_start_isp frame start for direct mode data in frontend0
16	RW	0x0	ddr_rd0_dol_more_line_pending When ddr_rd in dol mode and with ddr mode, will set this pending when ddr_rd received more lines than the setting fro ddr_rd0
15	RW	0x0	ddr_rd0_dol_less_line_pending When ddr_rd in dol mode and with ddr mode, will set this pending at 2 cases: 1 ddr_rd received the next frame_vsync and the number of lines is less than the setting for ddr_rd0 2 when set dol_time_out_en=1, and ddr_rd did not received valid line in the setting time period for ddr_rd0
14	RW	0x0	DS0 interrupt pending
13	RW	0x0	ddr_rd0_frame_rd_done_pending When ddr_rd0 read over one frame with setting in ddr_rd0, will set this pending
12	RW	0x0	ddr_rd0_frame_v_count_pending When ddr_rd0 has read "line_threshold" lines, will set this pending
11	RW	0x0	ddr_rd1_frame_rd_done_pending When ddr_rd1 read over one frame with setting in ddr_rd1, will set this pending
10	RW	0x0	ddr_rd1_frame_v_count_pending When ddr_rd1 has read "line_threshold" lines, will set this pending
9	RW	0x0	alig_data_less_timeout_pending When inc_mask_timeout_en is valid, will set this pending when no valid date from pixel last inc_mask_timeout x vclk cycles
8	RW	0x0	alig_frame_end_pending

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			When alignment send out the entire frame with camera setting in alignment (both valid period and blank period),will set this pending
7	RW	0x0	alig_lane0_pixel_less_pending When lane0 is in direct mode,will set this pending when the number of pixel in a line from source is less than camera setting in alignment
6	RW	0x0	alig_lane0_pixel_exc_pending When lane0 is in direct mode,will set this pending when the number of pixel in a line from source is more than camera setting in alignment
5	RW	0x0	alig_lane0_line_less_pending When lane0 is in direct mode, and inc_mask_timeout_en is valid, will set this pending when the number of line from source is less than camera setting in alignment
4	RW	0x0	alig_lane0_line_exc_pending When lane0 is in direct mode,will set this pending when the number of line from source is more than camera setting in alignment
3	RW	0x0	alig_lane1_pixel_less_pending When lane1 is in direct mode,will set this pending when the number of pixel in a line from source is less than camera setting in alignment
2	RW	0x0	alig_lane1_pixel_exc_pending When lane1 is in direct mode,will set this pending when the number of pixel in a line from source is more than camera setting in alignment
1	RW	0x0	alig_lane1_line_less_pending When lane1 is in direct mode, and inc_mask_timeout_en is valid, will set this pending when the number of line from source is less than camera setting in alignment
0	RW	0x0	alig_lane1_line_exc_pending When lane1 is in direct mode,will set this pending when the number of line from source is more than camera setting in alignment

**MIPI\_ADAPT\_IRQ\_MASK1 0x62**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0	RW	0x0	Irq_mask, set 1 to each bit to enable the pending in MIPI_ADAPT_IRQ_PENDING1 as interrupt

**MIPI\_ADAPT\_IRQ\_PENDING1 0x63**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5	RW	0x0	axi_ds_wbus_noblock_pending When noblock enable for ds axi wbus and frame_sync_en valid in the noblock module,will set this pending at frame_sync if the cmd number from ISP not equal the bresp number from NIC
4	RW	0x0	axi_fr_wbus_noblock_pending

Bit(s)	R/W	Default	Description
			When noblock enable for fr axi wbus and frame_sync_en valid in the noblock module, will set this pending at frame_sync if the cmd number from ISP not equal the bresp number from NIC
3	RW	0x0	ddr_rd0_dol_hang_pending When ddr_rd in dol mode, will set this pending when the next frame_sync come before ddr_rd send out all valid pixel
2	RW	0x0	ddr_rd1_dol_hang_pending When ddr_rd in dol mode, will set this pending when the next frame_sync come before ddr_rd send out all valid pixel
1	RW	0x0	alig_lane0_dir_data_timeout_pending When lane0 valid, will set this pending if did not receive valid data in valid period for 65535 vclk cycles
0	RW	0x0	alig_lane1_dir_data_timeout_pending When lane1 valid, will set this pending if did not receive valid data in valid period for 65535 vclk cycles

Below are MIPI CSI host registers.

#### Version 0x000

Bit(s)	R/W	Name	Description
31:0	R	Version	Version of the CSI-2 Host Controller

#### N\_LANES 0x004

Bit(s)	R/W	Name	Description
1:0	R/W	N_LANES	Number of Active Data Lanes. <ul style="list-style-type: none"> <li>00: 1 Data Lane (Lane 0)</li> <li>01: 2 Data Lanes (Lane 0, and 1)</li> <li>10: 3 Data Lanes (Lane 0,1 and 2)</li> <li>11: 4 Data Lanes (All)</li> </ul> Can only be updated when the PHY lane is in stopstate.

#### PHY\_SHUTDOWNZ 0x008

Bit(s)	R/W	Name	Description
0	R/W	PHY_SHUTDOWNZ	Shutdown input. This line is used to place the complete macro in power down. All analog blocks are in power down mode and digital logic is cleared. Active Low.

#### DPHY\_RSTZ 0x00C

Bit(s)	R/W	Name	Description
0	R/W	DPHY_RSTZ	DPHY reset output. Active Low.

**CSI2\_RESETN 0x010**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
0	R/W	CSI2_RESETN	CSI-2 controller reset output. Active Low.

**PHY\_STATE 0x014**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
0	R	phy_rxulpsesc_0	Lane module 0 has entered the Ultra Low Power mode
1	R	phy_rxulpsesc_1	Lane module 1 has entered the Ultra Low Power mode
2	R	phy_rxulpsesc_2	Lane module 2 has entered the Ultra Low Power mode
3	R	phy_rxulpsesc_3	Lane module 3 has entered the Ultra Low Power mode
4	R	phy_stopstatedata_0	Data Lane 0 in Stop state
5	R	phy_stopstatedata_1	Data Lane 1 in Stop state
6	R	phy_stopstatedata_2	Data Lane 2 in Stop state
7	R	phy_stopstatedata_3	Data Lane 3 in Stop state
8	R	phy_rxclkactivehs	Indicates that the clock lane is actively receiving a DDR clock
9	R	phy_rxulpclknot	Active Low. This signal indicates that the Clock Lane module has entered the Ultra Low Power state
10	R	phy_stopstateclk	Clock Lane in Stop state
11	R/W	bypass_2ecc_tst	Payload Bypass test mode for double ECC errors

**DATA\_IDS\_1 0x018**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
5:0	R/W	di0_dt	Data ID 0 Data Type
7:6	R/W	di0_vc	Data ID 0 Virtual channel
13:8	R/W	di1_dt	Data ID 1 Data Type
15:14	R/W	di1_vc	Data ID 1 Virtual channel
21:16	R/W	di2_dt	Data ID 2 Data Type
23:22	R/W	di2_vc	Data ID 2 Virtual channel
29:24	R/W	di3_dt	Data ID 3 Data Type
31:30	R/W	di3_vc	Data ID 3 Virtual channel

**DATA\_IDS\_2 0x01C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
5:0	R/W	di4_dt	Data ID 4 Data Type
7:6	R/W	di4_vc	Data ID 4 Virtual channel
13:8	R/W	di5_dt	Data ID 5 Data Type
15:14	R/W	di5_vc	Data ID 5 Virtual channel
21:16	R/W	di6_dt	Data ID 6 Data Type
23:22	R/W	di6_vc	Data ID 6 Virtual channel
29:24	R/W	di7_dt	Data ID 7 Data Type
31:30	R/W	di7_vc	Data ID 7 Virtual channel

**ERR1 0x020**

<b>Bit(s)</b>	<b>R/W</b>	<b>Name</b>	<b>Description</b>
0	R	phy_errsotsynchs_0	Start of Transmission Error on data lane 0 (no synchronization achieved)
1	R	phy_errsotsynchs_1	Start of Transmission Error on data lane 1 (no synchronization achieved)
2	R	phy_errsotsynchs_2	Start of Transmission Error on data lane 2 (no synchronization achieved)
3	R	phy_errsotsynchs_3	Start of Transmission Error on data lane 3 (no synchronization achieved)
4	R	err_f_bndry_match_vc0	Error matching Frame Start with Frame End for Virtual Channel 0
5	R	err_f_bndry_match_vc1	Error matching Frame Start with Frame End for Virtual Channel 1
6	R	err_f_bndry_match_vc2	Error matching Frame Start with Frame End for Virtual Channel 2
7	R	err_f_bndry_match_vc3	Error matching Frame Start with Frame End for Virtual Channel 3
8	R	err_f_seq_vc0	Incorrect Frame Sequence detected in Virtual Channel 0
9	R	err_f_seq_vc1	Incorrect Frame Sequence detected in Virtual Channel 1
10	R	err_f_seq_vc2	Incorrect Frame Sequence detected in Virtual Channel 2

Bit(s)	R/W	Default	Description
			5. Read back the ISP_COMMON:input port: mode status register to see the status of mode request. And wait until it shows the correct status. 6. Wait for the ISP_COMMON:isp global monitor: fr pipeline busy signal to become low. 7. Assert the global fsm reset. 8. Clear the global fsm reset. 9. Reconfigure the ISP configuration space. 10. Unmask the necessary interrupt sources. 11. Configure the input port in safe_start mode.

<a>:dma global config [26:0]

[0] : check bid

[1] : check rid

The following signals are diagnostic signals which helps identifying some of the AXI interface error cases. This must be used only as debug signals. You should follow these sequence

- Mask the dma error interrupt
- clear DMA interrupt if there is an active interrupt
- Write appropriate values to these registers
- Clear DMA alarms to clear the existing alarm
- unmask the DMA error interrupt

20	R/W		hs polarity vc 0 = vertical counter increments on rising edge of HS 1 = vertical counter increments on falling edge of HS
19:16	R/W		Reserved.
15	R/W		vc r select 0 = vertical counter is reset on edge of vs 1 = vertical counter is reset after timeout on hs
14	R/W		vc c select 0 = vertical counter counts on hs 1 = vertical counter counts on horizontal counter overflow or reset
13:4	R/W		Reserved.
3:0	R/W		Preset. Allows selection of various input port presets for standard sensor inputs. 2: preset mode 2, 6: preset mode 6, others: reserved

**0x00088**

Bit(s)	R/W	Default	Description
31:16	R/W	0x0000FFFF	hc start0. window0 start for ACL gate..
15:0	R/W		hc limit. horizontal counter limit value (counts: 0,1,...hc_limit-1,hc_limit,0,1,...)

**0x0008C**

Bit(s)	R/W	Default	Description
31:16	R/W	0x00000000	hc start. window1 start for HS gate..
15:0	R/W		hc size0. window0 size for ACL gate..

**0x00090**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0xFFFF0000	vc limit. vertical counter limit value (counts: 0,1,...vc_limit-1,vc_limit,0,1,...)
15:0	R/W		hc size1. window1 size for HS gate..

**0x00094**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00000000	vc size. window2 size for ACL gate..
15:0	R/W		vc start. window2 start for ACL gate..

**0x00098**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RO	-	frame height. detected frame height. Read only value.
15:0	RO		frame width. detected frame width. Read only value.

**0x0009C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x00000000	Reserved.
7	R/W		freeze config. Used to freeze input port configuration. Used when multiple register writes are required to change input port configuration. 0 = normal operation 1 = hold previous input port config state
6:3	R/W	0x00000000	Reserved.
2:0	R/W		mode request. Used to stop and start input port.. Only modes-0 and 1 are used. all other values are reserved 0 = safe stop 1 = safe start 2 = Reserved 3 = Reserved 4 = Reserved 5 = Reserved 6 = Reserved 7 = Reserved

**0x000A0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	RO	-	Reserved.
2:0	RO		mode status. Used to monitor input port status: bit 0: 1=running, 0=stopped, bits 1,2-reserved

**input port frame stats****0x000A4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0x000000000	Reserved.
0	R/W		stats reset. Resets the frame statistics registers and starts the sampling period. Note all the frame statistics saturate at $2^{31}$

**0x000A8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0x000000000	Reserved.
0	R/W		stats hold. Synchronously disables the update of the statistics registers. This should be used prior to reading out the register values so as to ensure consistent values

**0x000B4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active width min. The minimum number of active pixels observed in a line within the sampling period

**0x000B8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active width max. The maximum number of active pixels observed in a line within the sampling period

**0x000BC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active width sum. The total number of the active pixels values observed in a line within the sampling period

**0x000C0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active width num. The number of lines observed within the sampling period

**0x000C4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active height min. The minimum number of active lines in the frames observed within the sampling period

**0x000C8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active height max. The maximum number of active lines in the frames observed within the sampling period

**0x000CC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active height max. The total number of active lines in the frames observed within the sampling period.

**0x000D0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	active height num. The total number of frames observed within the sampling period

**0x000D4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	hblank min. The minimum number of horizontal blanking samples observed within the sampling period

**0x000D8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	hblank max. The maximum number of horizontal blanking samples observed within the sampling period

**0x000DC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	hblank sum. The total number of the horizontal blanking samples observed within the sampling period

**0x000E0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	hblank num. The total number of the lines observed within the sampling period

**0x000E4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	vblank min. The minimum number of vertical blanking samples observed within the sampling period

**0x000E8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	vblank max. The maximum number of vertical blanking samples observed within the sampling period

**0x000EC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	vblank sum. The total number of the vertical blanking samples observed within the sampling period

**0x000F0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	vblank num. The total number of frames observed within the sampling period

**LUT3D\_MEM Array**

This is an array of 1000 32-bit registers. The address for element (i) is: 0x00508 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x00508	31:0	R/W	-	Data(0)
0x0050c	31:0	R/W	-	Data(1)
...repeated until ...				
0x014A4	31:0	R/W	-	Data(999)

**DS\_SCALER\_HFILT\_COEFMEM Array**

This is an array of 512 32-bit registers. The address for element (i) is: 0x014A8 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x014A8	31:0	R/W	-	Data(0)
0x014AC	31:0	R/W	-	Data(1)
...repeated until ...				
0x01CA4	31:0	R/W	-	Data(511)

**DS\_SCALER\_VFILT\_COEFMEM Array**

This is an array of 512 32-bit registers. The address for element (i) is: 0x01CA8 + 4i.

Address	Bit(s)	R/W	Default	Description
0x01CA8	31:0	R/W	-	Data(0)
0x01CAC	31:0	R/W	-	Data(1)
...repeated until ...				
0x024A4	31:0	R/W	-	Data(511)

#### AEXP\_HIST\_STATS\_MEM Array

This is an array of 1024 32-bit registers. The address for element (i) is:  $0x024A8 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x024A8	31:0	R/W	-	Data(0)
0x024AC	31:0	R/W	-	Data(1)
...repeated until ...				
0x034A4	31:0	R/W	-	Data(1023)

#### IHIST\_STATS\_MEM Array

This is an array of 1024 32-bit registers. The address for element (i) is:  $0x034A8 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x034A8	31:0	R/W	-	Data(0)
0x034AC	31:0	R/W	-	Data(1)
...repeated until ...				
0x044A4	31:0	R/W	-	Data(1023)

#### METERING\_STATS\_PING\_MEM Array

This is an array of 6575 32-bit registers. The address for element (i) is:  $0x044B0 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x044B0	31:0	R/W	-	Data(0)
0x044B4	31:0	R/W	-	Data(1)
...repeated until ...				
0x0AB68	31:0	R/W	-	Data(6574)

#### DECOMPANDER0\_PING\_MEM Array

This is an array of 33 32-bit registers. The address for element (i) is:  $0x0AB6C + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x0AB6C	31:0	R/W	-	Data(0)
0x0AB70	31:0	R/W	-	Data(1)
...repeated until ...				
0x0ABEC	31:0	R/W	-	Data(32)

### **DECOMPANDER1\_PING\_MEM Array**

This is an array of 257 32-bit registers. The address for element (i) is: 0x0ABF0 + 4i.

Address	Bit(s)	R/W	Default	Description
0x0ABF0	31:0	R/W	-	Data(0)
0x0ABF4	31:0	R/W	-	Data(1)
...repeated until ...				
0x0AFF0	31:0	R/W	-	Data(256)

### **DPC\_PING\_MEM Array**

This is an array of 4096 32-bit registers. The address for element (i) is: 0x0AFF4 + 4i.

Address	Bit(s)	R/W	Default	Description
0x0AFF4	31:0	R/W	-	Data(0)
0x0AFF8	31:0	R/W	-	Data(1)
...repeated until ...				
0x0EFF0	31:0	R/W	-	Data(4095)

### **CA\_CORRECTION\_FILTER\_PING\_MEM**

Cromatic aberration correction polyphase filter lookup table, 32 entries of 32 bits each. Each entry address corresponds to fractional part of the pixel displacement.

Each entry is four 8-bit filter coefficients in fix point format.

- Codes 0...128 correspond to values 0.0 ... 1.0 (with resolution 1/128)
- Codes 129...191 correspond to values 129/128 ... 191/128
- Codes 192...255 correspond to values -64/128 ... -1/128

### **Array**

This is an array of 32 32-bit registers. The address for element (i) is: 0x0EFF4 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x0EFF4	31:0	R/W	-	Data(0)
0x0EFF8	31:0	R/W	-	Data(1)
...repeated until ...				
0x0F070	31:0	R/W	-	Data(31)

### **CA\_CORRECTION\_MESH\_PING\_MEM**

Chromatic aberration correction coordinate lookup table, 8192 entries for tile displacement of 16 bits each. Each entry is 16 bits, 8 LSBs is X displacement of the tile and 8 MSBs is Y displacement. The coordinates are coded as two's complement, 3.5 fixed point.

#### **Array**

This is an array of 4096 32-bit registers. The address for element (i) is:  $0x0F074 + 4i$

<b>.Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x0F074	31:0	R/W	-	Data(0)
0x0F078	31:0	R/W	-	Data(1)
...repeated until ...				
0x13070	31:0	R/W	-	Data(4095)

### **MESH\_SHADING\_PING\_MEM Array**

This is an array of 4096 32-bit registers. The address for element (i) is:  $0x13074 + 4i$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x13074	31:0	R/W	-	Data(0)
0x13078	31:0	R/W	-	Data(1)
...repeated until ...				
0x17070	31:0	R/W	-	Data(4095)

### **RADIAL\_SHADING\_PING\_MEM**

4 banks of radial shading lookup tables - for R,G,B,Ir channels. The banks start at the addresses 0, 256, 512, 768.

Each bank has 129 entries for piecewise linear table, each entry occupies 32 bits, of which 16 least significant bits are encoding shading correction factor in 4.12 fix point format.

#### **Array**

This is an array of 897 32-bit registers. The address for element (i) is:  $0x17074 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x17074	31:0	R/W	-	Data(0)
0x17078	31:0	R/W	-	Data(1)
...repeated until ...				
0x17E74	31:0	R/W	-	Data(896)

### IRIDIX\_RP\_PING\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x17E78 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x17E78	31:0	R/W	-	Data(0)
0x17E7C	31:0	R/W	-	Data(1)
...repeated until ...				
0x18078	31:0	R/W	-	Data(128)

### IRIDIX\_FP1\_PING\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x1807C + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x1807C	31:0	R/W	-	Data(0)
0x18080	31:0	R/W	-	Data(1)
...repeated until ...				
0x1827C	31:0	R/W	-	Data(128)

### FR\_GAMMA\_RGB\_PING\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x18280 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x18280	31:0	R/W	-	Data(0)
0x18284	31:0	R/W	-	Data(1)
...repeated until ...				
0x18480	31:0	R/W	-	Data(128)

### DS\_GAMMA\_RGB\_PING\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x18484 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x18484	31:0	R/W	-	Data(0)
0x18488	31:0	R/W	-	Data(1)
...repeated until ...				
0x18684	31:0	R/W	-	Data(128)

### LUMVAR\_STATS\_PING\_MEM Array

This is an array of 512 32-bit registers. The address for element (i) is: 0x18688 + 4i.

Address	Bit(s)	R/W	Default	Description
0x18688	31:0	R/W	-	Data(0)
0x1868C	31:0	R/W	-	Data(1)
...repeated until ...				
0x18E84	31:0	R/W	-	Data(512)

### ISP\_CONFIG\_PING (SINGLE\_CONTEXT\_CONFIG)

#### Top

Miscellaneous top-level ISP controls

#### 0x18E88

Bit(s)	R/W	Default	Description
31:16	R/W	0x04380780	Active Height. Active video height in lines
15:0	R/W		Active Width. Active video width in pixels

#### 0x18E8C

Bit(s)	R/W	Default	Description
31:26	R/W		Reserved
25:24	R/W	0x00000000	Linear data src. Linear data src 0 = Sensor stitched and linear data directly coming from sensor 1 = linear data from frame stitch 2 = Sensor companded data linearised through decomander 3 = reserved
23:18	R/W		Reserved
17:16	R/W		Cfa pattern. The pixel arrangement of the CFA array on the sensor. Set in the Top register group and used by several blocks in the pipeline: 0 = RGGB

Bit(s)	R/W	Default	Description
			1 = reserved 2 = Rlrb 3 = RGlrB
15:10	R/W		Reserved
9:8	R/W		RGGB start post mirror. Starting color of the rggb pattern for all the modules after mirror this must be same as RGGB start pre mirror if mirror is bypassed
7:2	R/W		Reserved
1:0	R/W		<b>RGGB start pre mirror.</b> Starting color of the rggb pattern for all the modules before mirror 0 = R Gr Gb B 1 = Gr R B Gb 2 = Gb B R Gr 3 = B Gb Gr R

**0x18EAC**

Bit(s)	R/W	Default	Description
31:6	R/W		Reserved
5	R/W		Bypass frame stitch. Bypass frame stitching logic
4	R/W	0x00000000	Bypass gain wdr. Bypass gain wdr
3	R/W		Bypass sensor offset wdr. Bypass sensor offset wdr
2	R/W		Bypass decompande. Bypass front end decompander
1	R/W		Bypass input formatter. Bypass input formatter module.
0	R/W		Bypass video test gen. Bypass video test generator

**0x18EB0**

Bit(s)	R/W	Default	Description
31:5	R/W		Reserved
4	R/W	0x00000004	Bypass defect pixel. Bypass static defect pixel
3	R/W		Bypass RAW frontend. Bypass RAW frontend (green equalization and dynamic defect pixel)
2	R/W		Bypass fe sqrt. Bypass square root function before raw frontend

1	R/W		Bypass frontend sensor offset. Bypass digital gain module
0	R/W		Bypass digital gain. Bypass digital gain module

**0x18EB8**

Bit(s)	R/W	Default	Description
31:3	R/W	0x00000002	Reserved
2	R/W		Bypass ca correction. Bypass chromatic abberation correction
1	R/W		Bypass temper
0	R/W		Bypass sinter

**0x18EBC**

Bit(s)	R/W	Default	Description
31:7	R/W	0x00000000	Reserved
6	R/W		Bypass iridix
5	R/W		Bypass iridix gain
4	R/W		Bypass white balance
3	R/W		Bypass mesh shading
2	R/W		Bypass radial shading
1	R/W		Bypass sensor offset pre shading. Bypass sensor offset pre shading
0	R/W		Bypass square be. Bypass backend square

**0x18EC0**

Bit(s)	R/W	Default	Description
31:8	R/W	0x00000000	Reserved
7	R/W		Bypass noneq u gamma
6	R/W		Bypass s 3D lut
5	R/W		Bypass s CNR
4	R/W		Bypass s CCM
3	R/W		Bypass pf correctio n
2	R/W		Bypass demosaic rgbir
1	R/W		Bypass demosaic rgb

Bit(s)	R/W	Default	Description
0	R/W		Bypass mirror. Bypass EW mirror

**0x18EC4**

Bit(s)	R/W	Default	Description
31:4	R/W	0x00000000	Reserved
3	R/W		Bypass fr cs conv
2	R/W		Bypass fr sharpen
1	R/W		Bypass fr gamma rgb
0	R/W		Bypass fr crop

**0x18EC8**

Bit(s)	R/W	Default	Description
31:5	R/W	0x00000000	Reserved
4	R/W		Bypass ds cs conv
3	R/W		Bypass ds sharpen
2	R/W		Bypass ds gamma rgb
1	R/W		Bypass ds scaler
0	R/W		Bypass ds crop

**0x18ECC**

Bit(s)	R/W	Default	Description
31:10	R/W	0x00000000	Reserved
9:8	R/W		ISP processing fr bypass mode. ISP FR bypass modes. For debug purposes only. Should be set to 0 during normal operation. Used to bypass entire ISP after input port or to pass the stitched image directly to the output. 0 = Full processing 1 = Bypass entire ISP processing and output [19:4] of raw sensor data After video test gen 2 = Bypass entire ISP processing and output LSB 10-bits bits of raw sensor data After video test gen. Data must be MSB aligned 3 = Reserved
7:2	R/W		Reserved
1	R/W		ISP downscale pipe disable.

Bit(s)	R/W	Default	Description
			0: Downscale pipeline is enabled 1: Downscale pipeline is disabled. No data is sent out in DMA and streaming channel 0 = Select processed. 1 = Bypass ISP RAW processing.
0	R/W		ISP RAW bypass. Used to select between normal ISP processing with image sensor data and up to 12 bit RGB input. In the latter case data is reinserted into pipeline after purple fringing correction block. 0 = Select processed. 1 = Bypass ISP RAW processing.

**0x18ED0**

Bit(s)	R/W	Default	Description
31:25	R/W	0x00010000	Reserved
24	R/W		aexp src. 0 = After static white balance when applied before shading 1 = After static white balance when applied after shading
23:20	R/W		Reserved
19	R/W		Lumavar switch. Luma variance tap in the pipeline. 0 = Full resolution pipeline, 1 = Downscaled pipeline
18	R/W		Lumavar Disable. 0 = Enabled, 1 = Disabled
17	R/W		Reserved
16	R/W		iHist disable. Post iridix histogram enable. Enables statistics gathering for global histogram 0 = Enabled, 1 = Disabled
15	R/W		Reserved
14:13	R/W		AEXP Histogram switch. AE global histogram tap in the pipeline. Location of statistics gathering for 1024 bin global histogram 0 = After static white balance whose position is selected by aexp_src signal 1 = After WDR Frame Stitch. if its sensor companded data, then use decompanded output. If its sensor linearised data, then use it directly 2 = After VTPG, 3 = reserved
12	R/W		AEXP hist disable. 0: AEXP 1024-bin histogram enabled 1: AEXP 1024-bin histogram disabled
11:10	R/W		Reserved
9	R/W		AWB switch. AWB tap in the pipeline. Location of AWB statistics collection.

Bit(s)	R/W	Default	Description
			0 = Immediately after demosaic, 1 = Immediately after CNR
8	R/W		AWB disable. 0: AWB enabled, 1: AWB disabled
7:6	R/W		Reserved
5	R/W		AF switch. AF tap in the pipeline. . 0 = After Sinter, 1 = before Sinter
4	R/W		AF disable. 0: AF enabled, 1: AF disabled
3	R/W		Reserved
2:1	R/W		AE switch. AE 5bin histogram tap in the pipeline. Location of AE statistic collection. 0 = After static white balance whose position is selected by aexp_src signal 1 = After WDR Frame Stitch. if its sensor companded data, then use decompanded output. If its sensor linearised data, then use it directly 2 = After VTPG, 3 = reserved
0	R/W		AE 5bin hist disable. 0: AEXP 5-bin histogram enabled, 1: AEXP 5-bin histogram disabled

27:16	R/W	0	offset 11. offset offset for color channel 11 (B)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**gain wdr**

Gain adjustment for the WDR stitching

**0x18FD4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29	R/W	0x01000100	Reserved
28:16	R/W		Gain m. Gain applied to ch-medium data in 5.8 format
15:13	R/W		Reserved
12:0	R/W		Gain l. Gain applied to ch-long data in 5.8 format

**0x18FD8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29	R/W	0x01000100	Reserved
28:16	R/W		Gain vs. Gain applied to ch-vs data in 5.8 format
15:13	R/W		Reserved
12:0	R/W		Gain s. Gain applied to ch-short data in 5.8 format

**0x18FDC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	black level m. Sensor offset applied to ch-medium data
15:12	R/W	0	Reserved
11:0	R/W	0	black level l. Sensor offset applied to ch-long data

**0x18FE0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	black level vs. Sensor offset applied to ch-veryshort data
15:12	R/W	0	Reserved
11:0	R/W	0	black level s. Sensor offset applied to ch-short data

**frame stitch**

4-exposure wide-dynamic-range blending

**NOTE:**

If the WDR is configured to stitch 2 exposures, then the configuration must be done through the LM\_ pair the short exposures black level must be programmed through the med\_black\_level register so that the LM pair can be used.

**0x18FE4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:8	R/W	0	<p>output select. This register is only for debug purpose. for normal operation it must be kept in its default value (0)</p> <p>0 : normal stitched output 1 : long data routed out 2 : medium data routed out 4 : short data routed out 8 : very short data routed out 16: LM stitched output taken out 32: MS stitched output taken out 64: SVS stitched output taken out others: reserved</p>
7:2	R/W	0	Reserved
1:0	R/W	0	<p>mode in.</p> <p>0 : 4-exposure 1 : 2-exposure 2 : 3-exposure 3 : 4-exposure</p>

**0x18FE8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01000100	Reserved
27:16	R/W		<p>MS Exposure Ratio. Sets ratio between medium and short exposures - this must match the actual exposure ratio on the sensor</p> <p>Format: unsigned 6.6-bit fixed-point</p>
15:12	R/W		Reserved
11:0	R/W		<p>LM Exposure Ratio. Sets ratio between long and medium exposures - this must match the actual exposure ratio on the sensor</p> <p>Format: unsigned 6.6-bit fixed-point</p>

**0x18FEC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0x01000100	Reserved
11:0	R/W		SVS Exposure Ratio. Sets ratio between short and very short exposures - this must match the actual exposure ratio on the sensor Format: unsigned 6.6-bit fixed-point

**0x18FF0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C000F00	Reserved
27:16	R/W		LM Thresh low. Data below this threshold will be taken from long exposure only
15:12	R/W		Reserved
11:0	R/W		LM Thresh high. These two thresholds are for LM pairs. Both are with respect to the longer stitches. Data above this threshold will be taken from short exposure only

**0x18FF4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C000F00	Reserved
27:16	R/W		Data below this threshold will be taken from long exposure only
15:12	R/W		Reserved
11:0	R/W		LM Thresh high. These two thresholds are for MS pairs. Both are with respect to the longer stitches. Data above this threshold will be taken from short exposure only

**0x18FF8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C000F00	Reserved
27:16	R/W		SVS Thresh low. Data below this threshold will be taken from long exposure only
15:12	R/W		Reserved
11:0	R/W		SVS Thresh high. These two thresholds are for SVS pairs. Both are with respect to the longer stitches. Data above this threshold will be taken from short exposure only

**0x18FFC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Black level Medium. Black level for medium exposure input
15:12	R/W	0	Reserved
11:0	R/W	0	Black level long. Black level for long exposure input <b>Note:</b> <i>If the wdr unit is configured to use as 2-exposure, THIS REGISTER POSITION must contain the black level of short exposure as the LM pair is used for all other configurations</i>

**0x19000**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Black level very Short. Black level for very short exposure input
15:12	R/W	0	Reserved
11:0	R/W	0	Black level Short. Black level for short exposure input

**0x19004**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	Black level Out. Black level for module output

**0x19008**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x06000180	Reserved
27:16	R/W		MS NP mult. The noise profile weights are multiplied by this value to give expected noise amplitude.
15:12	R/W		Reserved
11:0	R/W		LM NP mult. The noise profile weights are multiplied by this value to give expected noise amplitude.

**0x1900C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C000600	Reserved

Bit(s)	R/W	Default	Description
27:16	R/W		LM Alpha MOV slope. This defines the gradient of the motion alpha ramp. Higher values mean a steeper ramp and so a more rapid transition between non-motion-corrected and motion-corrected regions.
15:12	R/W		Reserved
11:0	R/W		SVS NP mult. The noise profile weights are multiplied by this value to give expected noise amplitude.

**0x19010**

Bit(s)	R/W	Default	Description
31:28	R/W	0x01800180	Reserved
27:16	R/W		SVS Alpha MOV slope. This defines the gradient of the motion alpha ramp. Higher values mean a steeper ramp and so a more rapid transition between non-motion-corrected and motion-corrected regions.
15:12	R/W		Reserved
11:0	R/W		MS Alpha MOV slope. This defines the gradient of the motion alpha ramp. Higher values mean a steeper ramp and so a more rapid transition between non-motion-corrected and motion-corrected regions.

**0x19014**

Bit(s)	R/W	Default	Description
31:28	R/W	0x01000100	Reserved
27:16	R/W		Gain B. Multiplier for color channel B Format: unsigned 4.8-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		Gain R. Multiplier for color channel R Format: unsigned 4.8-bit fixed-point

**0x19018**

Bit(s)	R/W	Default	Description
31:12	R/W	0x00000100	Reserved
11:0	R/W		Consistency thresh mov. Pixel consistency reporting - motion threshold Format: unsigned 4.8-bit fixed-point

**0x1901C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	<b>0x00080000</b>	Reserved
19:0	R/W		Consistency thresh lvl. Pixel consistency reporting - flicker threshold Format: unsigned 4.8-bit fixed-point

**0x19020**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:22	R/W	0	Reserved
21:16	R/W	0	Im neg weight. Higher values make it more likely to interpret differences between the long and medium exposures as noise (and thus do no motion correction).
15:14	R/W	0	Reserved
13:8	R/W	0	Im pos weight. Lower values make it more likely to interpret differences between the long and medium exposures as noise (and thus do no motion correction).
7:6	R/W	0	Reserved
5:0	R/W	0	Im noise thresh. Higher values make it more likely to interpret differences between the long and medium exposures as noise (and thus do no motion correction).

**0x19024**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Im med noise intensity thresh
15:12	R/W	0	Reserved
11:0	R/W	0	Im med noise alpha thresh

**0x19028**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:22	R/W	0	Reserved
21:0	R/W	0	Im mc blend slope

**0x1902C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Im mc blend offset
15:8	R/W	0	Reserved
7:0	R/W	0	Im mc blend thresh

**0x19030**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:22	R/W	0	Reserved
21:0	R/W	0	Im mc thresh slope

**0x19034**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	Im mc thresh thresh

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11:0	R/W	0	Im mc thresh offset

**0x1903C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:22	R/W	0	Reserved
21:0	R/W	0	Im mc mag thresh slope

**0x19040**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	Im mc mag thresh thresh

**0x19044**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31:28	R/W	0	Reserved
27:16	R/W	0	Im mc mag lblend thresh
15:12	R/W	0	Reserved
11:0	R/W	0	Im mc mag thresh offset

**0x19048**

Bit(s)	R/W	Default	Description
31:24	R/W	0	Reserved
23:16	R/W	0	Exposure mask thresh. Threshold for selection of exposure mask in blending regions. Where the alpha value is above this value the shorter exposure will be indicated.
15:12	R/W	0	Reserved
11:0	R/W	0	MCoff WB offset

**0x1904C**

Bit(s)	R/W	Default	Description
31:17	R/W	0	Reserved
16	R/W	0	Im alg select. Select which L/M stitching algorithm to use.
15:9	R/W	0	Reserved
8	R/W	0	mcoff mode enable
7:3	R/W	0	Reserved
2	R/W	0	MCoff NC Enable
1	R/W	0	Use 3x3 max
0	R/W	0	bwb select

**0x19050**

Bit(s)	R/W	Default	Description
31:28	R/W	0	Reserved
27:16	R/W	0	MCoff M max
15:12	R/W	0	Reserved
11:0	R/W	0	MCoff L max

**0x19054**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	MCoff vs max
15:12	R/W	0	Reserved
11:0	R/W	0	MCoff S max

**0x19058**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	MCoff LM scaler
15:12	R/W	0	Reserved
11:0	R/W	0	MCoff L scaler

**0x1905C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	MCoff NC thresh low
15:12	R/W	0	Reserved
11:0	R/W	0	MCoff LMS scaler

**0x19060**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

27:16	R/W	0	MCoff NC scale
15:12	R/W	0	Reserved
11:0	R/W	0	MCoff NC thresh high

**frame stitch NP LUT VS**

Noise profile for short exposure data at frame stitch.

This is an array of 128 8-bit registers. The address for element (i) is: 0x19064 + 4 \* int(i / 4).

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x19064	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.

Address	Bit(s)	R/W	Default	Description
0x190E0	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x190E8	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x190E0	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

### frame stitch NP LUT S

Noise profile for med2 exposure data at frame stitch

This is an array of 128 8-bit registers. The address for element (i) is:  $0x190E4 + 4 * \text{int}(i / 4)$ .

Address	Bit(s)	R/W	Default	Description
0x190E4	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x190E8	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x19160	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.

Address	Bit(s)	R/W	Default	Description
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

### frame stitch NP LUT M

Noise profile for med1 exposure data at frame stitch

This is an array of 128 8-bit registers. The address for element (i) is:  $0x19164 + 4 * \text{int}(i / 4)$ .

Address	Bit(s)	R/W	Default	Description
0x19164	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x19168	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x191E0	31:24	R/W	-	Weight lut(127). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

### frame stitch NP LUT L

Noise profile for long exposure data at frame stitch

This is an array of 128 8-bit registers. The address for element (i) is:  $0x191E4 + 4 * \text{int}(i / 4)$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x191E4	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x191E8	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x19260	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

**decompander0 0x19264**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:5	R/W	0	Reserved
4	R/W	0	Offset Mode. Lookup0 reflection mode for black offset region 0 = Manual curve reflection 1 = Automatic curve reflection
3:1	R/W	0	Reserved
0	R/W	0	Enable. Frontend lookup0 enable: 0=off 1=on

**decompander1 0x19268**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:5	R/W	0	Reserved
4	R/W	0	Offset Mode. Lookup0 reflection mode for black offset region 0 = Manual curve reflection 1 = Automatic curve reflection
3:1	R/W	0	Reserved

Bit(s)	R/W	Default	Description
0	R/W	0	Enable. Frontend lookup0 enable: 0=off 1=on

**digital gain 0x1926C**

Bit(s)	R/W	Default	Description
31:12	R/W	0x00000100	Reserved
11:0	R/W		<b>Gain.</b> Gain applied to data in 4.8 format

**sensor offset fe**

offset offset subtraction for each color channel and exposure

**0x19274**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x19278**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	offset 01. offset offset for color channel 01 (Gr)

**0x1927C**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**0x19280**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	offset 11. offset offset for color channel 11 (B)

**sqrt**

sensor offset for the sqrt module

**0x19284**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	black level in. input Data black level

**0x19288**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	black level out. output Data black level

**raw frontend**

RAW frontend processing

**0x1928C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x00000005	Reserved
7	R/W		bright disable. Disable detection of bright pixels
6	R/W		dark disable. Disable detection of dark pixels
5:4	R/W		Reserved
3	R/W		show dynamic defect pixel. Show Defect Pixel: 0=off, 1=on
2	R/W		dp enable. Dynamic Defect Pixel enable: 0=off, 1=on
1	R/W		Reserved
0	R/W		ge enable. Green equalization enable: 0=off, 1=on

**0x19290**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	debug sel. Debug selection port

**0x19294**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00400200	Reserved
27:16	R/W		dp threshold. Defect pixel threshold.
15:12	R/W		Reserved
11:0	R/W		dp slope. Slope for HP Mask function

**0x19298**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x000000266	Reserved
23:16	R/W		dp blend. Controls blending between non-directional and directional replacement values in dynamic defect pixel correction. 0x00 Replace detected defects with non-directional replacement value 0xFF Replace detected defects with directional replacement value
15:0	R/W		dpdev threshold. Controls the aggressiveness of the dynamic defect pixel correction near edges.

**0x1929C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x04000000	ge threshold. green equalization threshold
15:8	R/W		Reserved
7:0	R/W		ge strength. Controls strength of Green equalization. Set during calibration.

**0x192A0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x008000AA	Reserved
23:15	R/W		ge sens. Controls the sensitivity of green equalization to edges.
15:12	R/W		Reserved
11:0	R/W		ge slope. Slope for GE Mask function

**0x192A4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00000150	Sigma In. Manual override of noise estimation
15:0	R/W		line thresh. Controls the directional nature of the dynamic defect pixel correction near edges

**0x19A8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00003000	Reserved
15:8	R/W		Thresh Long. Noise threshold for long exposure data Format: unsigned 4.4-bit floating-point
7:0	R/W		Thresh Short. Noise threshold for short exposure data Format: unsigned 4.4-bit floating-point

**raw frontend np**

Noise profile controls for RAW frontend

**0x192AC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x0000FFFF	Reserved
15:0	R/W		Exp Thresh. Threshold for determining long/short exposure data

**0x192B0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00000420	Reserved
15:8	R/W		Long Ratio. Multiplier applied to long exposure data for noise profile calculation Format: unsigned 6.2-bit fixed-point
7:0	R/W		Short Ratio. Multiplier applied to short exposure data for noise profile calculation Format: unsigned 6.2-bit fixed-point

**0x192B4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/W	0	Reserved
8	R/W	0	NP off reflect. Defines how values below black level are obtained. 0: Repeat the first table entry.

Bit(s)	R/W	Default	Description
			1: Reflect the noise profile curve below black level.
7	R/W	0	Reserved
6:0	R/W	0	NP off. Noise profile black level offset

### raw frontend np lut

Noise profile controls for RAW frontend

This is an array of 128 8-bit registers. The address for element (i) is:  $0x192B8 + 4 * \text{int}(i / 4)$ .

Address	Bit(s)	R/W	Default	Description
0x192B8	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x192BC	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x19334	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

### defect pixel

Detection and processing of static defect-pixels

#### 0x1933C

Bit(s)	R/W	Default	Description
31:4	R/W	0	Reserved
3	R/W	0	Detection enable. Starts detection
2	R/W	0	Show Static Defect Pixels. Show which pixels have been detected as bad
1	R/W	0	Correction Enable. Correction enable: 0=off 1=on

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0	R/W	0	Show Reference. For debug purposes. Show reference values which are compared with actual values to detect bad pixels

**0x19340**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	RO	-	Reserved
27:16	RO	-	Table Start. Address of first defect-pixel in defect-pixel store
15:13	RO	-	Reserved
12:1	RO	-	Defect Pixel Count. Number of defect-pixels detected
0	RO	-	Overflow. Table overflow flag

**0x19344**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11:0	R/W	0	Defect Pixel Count In. Number of defect-pixels in the written table

**sinter****0x19348**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x00000001C	Reserved
7	R/W		rm enable. Adjusts sinter strength radially from center to compensate for Lens shading correction. enable: 0=off, 1=on
6	R/W		Int select. Select intensity filter. Should not be modified from suggested values.
5	R/W		Filter select. Sinter filter fine tuning. Should not be modified from suggested values.
4	R/W		Enable. Sinter enable: 0=off 1=on
3:0	R/W		Reserved

**0x1934C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:6	R/W	0x000000034	Reserved
5	R/W		nonlinear wkgen. This config is only valid fr sinter3 Enables (1) or disables (0) nonlinear weight generation
4	R/W		nLM en. This config is only valid fr sinter3 Enables (1) or disables (0) the NLM filter
3:0	R/W		int config. Intensity blending with mosaic raw

**0x19350**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x000000009	Reserved
7:0	R/W		sad filt thresh. Block match difference filtering threshold

**0x19354**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x01680280	rm center y. Center y coordinate of shading map
15:0	R/W		rm center x. Center x coordinate of shading map

**0x19358**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x000000100	Reserved
15:0	R/W		rm off center mult. Normalizing factor which scales the radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x1935C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	Thresh 4h. Noise threshold for low horizontal spatial frequencies
23:16	R/W	0	Thresh 2h. Noise threshold for low horizontal spatial frequencies
15:8	R/W	0	Thresh 1h. Noise threshold for high horizontal spatial frequencies
7:0	R/W	0	Thresh 0h. Noise threshold for high horizontal spatial frequencies

**0x19360**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	Thresh 4v. Noise threshold for high vertical spatial frequencies
23:16	R/W	0	Thresh 2v. Noise threshold for high vertical spatial frequencies
15:8	R/W	0	Thresh 1v. Noise threshold for low vertical spatial frequencies
7:0	R/W	0	Thresh 0v. Noise threshold for low vertical spatial frequencies

**0x19364**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0xFFFFFFFF	Strength 4. Noise reduction effect for low spatial frequencies
23:16	R/W		Strength 2. Unused - no effect
15:8	R/W		Strength 1. Noise reduction effect for high spatial frequencies
7:0	R/W		Strength 0. Unused - no effect

**sinter Noise Profile**

Noise profile controls for Sinter

**0x19368**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x000000803	Reserved
15:8	R/W		global offset. A global offset that will be added to each of the hlog... values above..
7:3	R/W		Reserved
2	R/W		Black Reflect. Specifies how to deal with data below black level. 0: Clip to zero, 1: Reflect.
1	R/W		use exp mask. 1 = use exposure mask provided by Frame stitching or threshold
0	R/W		Use LUT. 1 = use LUT data 0 = use exposure mask provided by Frame stitching or threshold

**0x1936C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	Black Level. Black level offset for Mode 0

**0x19370**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W		Reserved
15:0	R/W	0x00004000	<p>Thresh1. Exposure thresholds. Used to determine which exposure generated the current pixel.</p> <p>Pixels with a value greater than or equal to a given threshold will be deemed to have been generated by the shorter exposure.</p> <p>Pixels with a value less than a given threshold will be deemed to have been generated by the longer exposure.</p> <p>E.G. Where 4 exposures are used:</p> <p>VS &gt;= Thresh 3 &gt; S &gt;= Thresh 2 &gt; M &gt;= Thresh 1 &gt; L</p> <p>For 3 exposures set Thresh 1 to 0</p> <p>For 2 exposures set Thresh 1 and Thresh 2 to 0</p> <p>For 1 exposures set all exposure thresholds to 0</p>

**0x19374**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W		Reserved
15:0	R/W	0x00008000	Thresh2, see above

**0x19378**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W		Reserved
15:0	R/W	0x0000C000	Thresh3, see above

**0x1937C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	noise level 3. Noise level of L exposure
23:16	R/W	0	noise level 2. Noise level of M exposure
15:8	R/W	0	noise level 1. Noise level of S exposure
7:0	R/W	0	noise level 0. Noise level of VS exposure

**sinter Noise Profile LUT**

This is an array of 128 8-bit registers. The address for element (i) is: 0x19438 + 4 \* int(i / 4)

Address	Bit(s)	R/W	Default	Description
0x19438	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x1943C	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x194B4	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

### sinter shading

This is an array of 33 8-bit registers. The address for element (i) is: 0x1A9F8 + 4 \* int(i / 4).

Address	Bit(s)	R/W	Default	Description
0x1A9F8	31:24	R/W	-	rm shading lut(3). Radial Sinter LUT.
	23:16	R/W	-	rm shading lut(2). Radial Sinter LUT.
	15:8	R/W	-	rm shading lut(1). Radial Sinter LUT.
	7:0	R/W	-	rm shading lut(0). Radial Sinter LUT.
0x1A9FC	31:24	R/W	-	rm shading lut(7). Radial Sinter LUT.
	23:16	R/W	-	rm shading lut(6). Radial Sinter LUT.
	15:8	R/W	-	rm shading lut(5). Radial Sinter LUT.
	7:0	R/W	-	rm shading lut(4). Radial Sinter LUT.
... repeated until ...				
0x1AA14	31:24	R/W	-	rm shading lut(31). Radial Sinter LUT.
	23:16	R/W	-	rm shading lut(30). Radial Sinter LUT.

Address	Bit(s)	R/W	Default	Description
0x1AA18	15:8	R/W	-	rm shading lut(29). Radial Sinter LUT.
	7:0	R/W	-	rm shading lut(28). Radial Sinter LUT.
0x1AA18	31:8	R/W	-	Reserved
	7:0	R/W	-	m shading lut(32)

**temper**

Temporal noise reduction

**0x1AA1C**

Bit(s)	R/W	Default	Description
31:2	R/W	0	Reserved
1	R/W	0	Temper2 Mode. 0: 0=Temper3 mode 1=Temper2 mode
0	R/W	0	Enable. Temper enable: 0=off 1=on

**0x1AA24**

Bit(s)	R/W	Default	Description
31:16	R/W	0x00000202	Reserved
15:8	R/W		Delta
7:4	R/W		Reserved
3:0	R/W		Recursion Limit. Controls length of filter history. Low values result in longer history and stronger temporal filtering

**temper Noise Profile**

Noise profile controls for Temper

**0x1AA28**

Bit(s)	R/W	Default	Description
31:16	R/W	0x00000803	Reserved
15:8	R/W		global offset. A global offset that will be added to each of the hlog... values above.
7:3	R/W		Reserved
2	R/W		Black Reflect. Specifies how to deal with data below black level. 0: Clip to zero, 1: Reflect
1	R/W		use exp mask. 1 = use exposure mask provided by Frame stitching or threshold
0	R/W		Use LUT

Bit(s)	R/W	Default	Description
			1 = use LUT data 0 = use exposure mask provided by Frame stitching or threshold

**0x1AA2C**

Bit(s)	R/W	Default	Description
31:16	R/W	0	Reserved
15:0	R/W	0	Black Level. Black level offset for Mode 0

**0x1AA30**

Bit(s)	R/W	Default	Description
31:16	R/W		Reserved
15:0	R/W	0x00004000	<p>Thresh1. Exposure thresholds. Used to determine which exposure generated the current pixel.</p> <p>Pixels with a value greater than or equal to a given threshold will be deemed to have been generated by the shorter exposure.</p> <p>Pixels with a value less than a given threshold will be deemed to have been generated by the longer exposure.</p> <p>E.G. Where 4 exposures are used:</p> <p>VS &gt;= Thresh 3 &gt; S &gt;= Thresh 2 &gt; M &gt;= Thresh 1 &gt; L</p> <p>For 3 exposures set Thresh 1 to 0</p> <p>For 2 exposures set Thresh 1 and Thresh 2 to 0</p> <p>For 1 exposures set all exposure thresholds to 0</p>

**0x1AA34**

Bit(s)	R/W	Default	Description
31:16	R/W		Reserved
15:0	R/W	0x00008000	Thresh2. See above.

**0x1AA38**

Bit(s)	R/W	Default	Description
31:16	R/W		Reserved
15:0	R/W	0x0000C000	Thresh3. See above.

**0x1AA3C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	noise level 3. Noise level of L exposure
23:16	R/W	0	noise level 2. Noise level of M exposure
15:8	R/W	0	noise level 1. Noise level of S exposure
7:0	R/W	0	noise level 0. Noise level of VS exposure

**temper Noise Profile LUT**

This is an array of 128 8-bit registers. The address for element (i) is:  $0x1AAF8 + 4 * \text{int}(i / 4)$

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x1AAF8	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x1AAFC	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x1AB74	31:24	R/W	-	Weight lut(127). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

**temper dma****0x1AB78**

Bit(s)	R/W	Default	Description
31:11	R/W	0x0000000F	Reserved
10	R/W		temper dw. 0: 16bit valid data 1: upto 12 bit valid data, MSB aligened to 16 bit
9:4	R/W		Reserved
3	R/W		Frame read on LSB dma. This must be set to 1 whenever Temper (either T2 or T3 mode) is enabled
2	R/W		Frame read on MSB dma. This must be set to 1 only in Temper-3 mode
1	R/W		Frame write on LSB dma. This must be set to 1 whenever Temper (either T2 or T3 mode) is enabled
0	R/W		Frame write on MSB dma. This must be set to 1 only in Temper-3 mode

**0x1AB7C**

Bit(s)	R/W	Default	Description
31:8	R/W	0x00000014	Reserved
7:0	R/W		Format. 20: for 16bit data both in T3 and T2 modes 6 : for 12bit data both in T3 and T2 modes

**0x1AB80**

Bit(s)	R/W	Default	Description
31:0	RO	-	The bits are defined as follows: 0 Write FIFO Fail (Full) 1 Write FIFO Fail (Empty) 2 Read FIFO Fail (Full) 3 Read FIFO Fail (Empty) 4 Pack Fail (Overflow) 5 Unpack Fail (Overflow) 6 Writer fail (Active Width) 7 Writer fail (Active Height) 8 Writer fail (Interline blanking) 9 Writer fail (Interframe blanking) 10 Reader fail (Active Width) 11 Reader fail (Active Height)

Bit(s)	R/W	Default	Description
			12 Reader fail (Interline blanking) 13 Reader fail (Interframe blanking) 14 0 15 0 16 Writer fail (A resp) 17 Writer fail (AW wait) 18 Writer fail (W wait) 19 Writer fail (Outstanding Transactions) 20 Reader fail (AR wait) 21 Reader fail (R resp) 22 Reader fail (Outstanding Transfers) 23 0 24 intw_fail_user_intfSig 25 intr_fail_user_intfSig 26 0 27 0 28 0 29 0 30 0 31 0

**0x1AB84**

Bit(s)	R/W	Default	Description
31:0	R/W	0	msb bank base writer. base address for frame buffer, should be word-aligned. This is used only in 16bit temper3 mode. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The MSB part is stored into this buffer.

**0x1AB88**

Bit(s)	R/W	Default	Description
31:0	R/W	0	lsb bank base writer. base address for frame buffer, should be word-aligned. This is used all the times temper is used.. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The LSB part is stored into this buffer.

**0x1AB8C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	msb bank base reader. base address for frame buffer, should be word-aligned. This is used only in 16bit temper3 mode. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The MSB part is stored into this buffer

**0x1AB90**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	lsb bank base reader. base address for frame buffer, should be word-aligned. This is used all the times temper is used.. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The LSB part is stored into this buffer.

**0x1AB94**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0x00001000	Line offset. Indicates the offset in bytes from the start of one line to the next line. This value should be equal to or larger than one line of image data and should be word-aligned

**0x1AB98**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R/W	0x00000002	Reserved
1	R/W		linetick eol. linetick start/end of line control. 0 = use start of line, 1 = use end of line
0	R/W		Reserved

**0x1ABA0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00000040	linetick repeat. line number of first linetick. 0 = no repeat
15:0	R/W		linetick first. line number of first linetick. 0 = no linetick

**0x1ABA8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/W	0x0F007E00	Reserved
8	R/W		writer axi id multi. 0= static value (axi_id_value) for awid/wid, 1 = incrementing value per transaction for awid/wid wrapping to 0 after axi_id_value
7:4	R/W		lsb writer axi id value. value to send for awid, wid and expected on bid
3:0	R/W		msb writer axi id value. value to send for awid, wid and expected on bid.

**0x1ABAC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x0F007E00	Reserved
7:4	R/W		lsb reader axi id value. value to send for awid, wid and expected on bid. Good default = "0000"
3:0	R/W		msb reader axi id value. value to send for awid, wid and expected on bid. Good default = "0000"

**ca correction****0x1ABB0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:6	R/W	0	Reserved
5:4	R/W	0	Mesh Scale. extra shift of mesh data: 00- no shift, 01- shift left by 1, ..., 11- shift left by 3, used to increase the range at cost of accuracy
3:1	R/W	0	Reserved
0	R/W	0	Enable. module enable, if 0 the data_i(dw*(kh-1)/2+dw-1 downto dw*(kh-1)/2) is presented at data_o after pipeline length

**0x1ABB4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:23	R/W	0x00400040	Reserved
22:16	R/W		Mesh Height.number of tiles vertically. Maximum supported mesh height is 64 for RGGB sensor and 42 for RGBIr sensors.
15:7	R/W		Reserved
6:0	R/W		Mesh Width. number of tiles across. Maximum supported mesh width is 64.

**0x1ABB8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29	R/W	0x00400040	Reserved
28:16	R/W		Plane Offset. offset between colour planes, can differ from line_offset*mesh_height
15:13	R/W		Reserved
12:0	R/W		Line Offset. offset between lines of tiles, can differ from mesh_width, but its safe to keep same as mesh width

**square be**

sensor offset for the square module

**0x1ABC0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	black level in. input Data black level

**0x1ABC4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	black level out. output Data black level

**sensor offset pre shading**

offset offset subtraction for each color channel and exposure

**0x1ABC8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x1ABCC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 01. offset offset for color channel 01 (Gr)

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 11. offset offset for color channel 10 (B)

**radial shading**

Radial Lens shading correction

**0x1ABD8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0	Reserved
0	R/W	0	Enable. Lens shading correction enable: 0=off, 1=on

**0x1ABDC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerR y. Center y coordinate of the red shading map
15:0	R/W		centerR x. Center x coordinate of the red shading map

**0x1ABE0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerG y. Center y coordinate of the green shading map
15:0	R/W		centerG x. Center x coordinate of the green shading map

**0x1ABE4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerB y. Center y coordinate of the blue shading map
15:0	R/W		centerB x. Center x coordinate of the blue shading map

**0x1ABE8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerIr y. Center y coordinate of the IR shading map
15:0	R/W		centerIr x. Center x coordinate of the IR shading map

**0x1ABEC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multRy. Normalizing Y factor which scales the Red radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.
15:0	R/W		off center multRx. Normalizing X factor which scales the Red radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x1ABF0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multGy. Normalizing Y factor which scales the green radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels
15:0	R/W		off center multGx. Normalizing X factor which scales the green radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x1ABF4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multBy. Normalizing Y factor which scales the blue radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.
15:0	R/W		off center multBx. Normalizing X factor which scales the blue radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x1ABF8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multiRy. Normalizing Y factor which scales the Ir radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.
15:0	R/W		off center multiRx. Normalizing X factor which scales the Ir radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**mesh shading**

Mesh Lens shading correction

**0x1ABFC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0x3F3FE406	Reserved
29:24	R/W		Mesh height. Number of vertical nodes minus 1

Bit(s)	R/W	Default	Description
23:22	R/W		Reserved
21:16	R/W		Mesh width. Number of horizontal nodes minus 1
15:14	R/W		Mesh page Ir. Selects memory page for IR pixels correction.
13:12	R/W		Mesh page B. Selects memory page for blue pixels correction.
11:10	R/W		Mesh page G. Selects memory page for green pixels correction.
9:8	R/W		Mesh page R. Selects memory page for red pixels correction.
7	R/W		Reserved
6:5	R/W		Mesh alpha mode. Sets alpha blending between mesh shading tables. 0 = no alpha blending; 1=2 banks (odd/even bytes) 2=4 banks (one per 8 bit lane in each dword)
4:2	R/W		Mesh scale. Selects the precision and maximal gain range of mesh shading correction Gain range: 00- 0..2; 01- 0..4; 02- 0..8; 03- 0..16; 04- 1..2; 05- 1..3; 06- 1..5; 07- 1..9(float)
1	R/W		Mesh show. Lens shading correction debug: 0=off, 1=on (show mesh data)
0	R/W		Enable. Lens shading correction enable: 0=off, 1=on

**0x1AC04**

Bit(s)	R/W	Default	Description
31:12	R/W	0	Reserved
11:9	R/W	0	Mesh alpha bank Ir. Bank selection for Ir blend: 0: 0+1; 1: 1+2; 2: 2:3; 3: 3+0; 4:0+2; 5: 1+3; 6,7: reserved
8:6	R/W	0	Mesh alpha bank B. Bank selection for B blend: 0: 0+1; 1: 1+2; 2: 2:3; 3: 3+0; 4:0+2; 5: 1+3; 6,7: reserved
5:3	R/W	0	Mesh alpha bank G. Bank selection for G blend: 0: 0+1; 1: 1+2; 2: 2:3; 3: 3+0; 4:0+2; 5: 1+3; 6,7: reserved:

11:0	R/W		Gain 00. Multiplier for color channel 00 (R) Format: unsigned 4.8-bit fixed-point

**0x1AC1C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01000100	Reserved
27:16	R/W		Gain 11. Multiplier for color channel 11 (B) Format: unsigned 4.8-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		Gain 10. Multiplier for color channel 10 (Gb) Format: unsigned 4.8-bit fixed-point

**iridix gain**

Digital gain for RAW sensor data

**0x1AC20**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0x00000100	Reserved
11:0	R/W		Gain. Gain applied to data in 4.8 format

**0x1AC24**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	Offset. Data black level

**iridix**

Iridix is an adaptive, space-variant tone mapping engine.

It is used to maintain or enhance shadow detail while preserving highlights.

**0x1AC28**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00004629	Reserved
15:14	R/W		stat mult
13:7	R/W		Reserved
6	R/W		postgamma pos. PosGamma application 0=gain 1=data
5	R/W		black level amp0. 1=Ignore Black level (set to zero) in amplifier. 0=Use Black level value.
4	R/W		Reserved
3	R/W		max alg type. Max Bayer Algorithm Type.
2:1	R/W		Reserved

Bit(s)	R/W	Default	Description
0	R/W		iridix on. Iridix enable: 0=off 1=on

**0x1AC2C**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00408012	Reserved
13:16	R/W		slope min. Restricts the minimum slope (gain) which can be generated by the adaptive algorithm
15:8	R/W		slope max. Restricts the maximum slope (gain) which can be generated by the adaptive algorithm
7:4	R/W		variance intensity. Sets the degree of luminance sensitivity of the algorithm(Irdx7F)
3:0	R/W		variance space. Sets the degree of spatial sensitivity of the algorithm(Irdx7F)

**0x1AC30**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	black level. Iridix black level. Values below this will not be affected by Iridix.

**0x1AC34**

Bit(s)	R/W	Default	Description
31:20	R/W	0x0000FFFF	Reserved
19:0	R/W		white level. Iridix white level. Values above this will not be affected by Iridix.

**0x1AC38**

Bit(s)	R/W	Default	Description
31:12	R/W	0x000000100	Reserved
11:0	R/W		collection correction

**0x1AC3C**

### demosaic rgb

Bayer Demosaic

#### 0x1AE7C

Bit(s)	R/W	Default	Description
31:24	R/W	0xADAAC0C0	UU Slope. Slope of undefined blending threshold in 4.4 logarithmic format
23:16	R/W		VA Slope. Slope of VH-AA blending threshold in 4.4 log format. High values will tend to favor one direction over the other (depending on VA Thresh) while lower values will give smoother blending.
15:8	R/W		AA Slope. Slope of angular (45/135) blending threshold in 4.4 format. High values will tend to favor one direction over the other (depending on AA Thresh) while lower values will give smoother blending.
7:0	R/W		VH Slope. Slope of vertical/horizontal blending threshold in 4.4 logarithmic format. High values will tend to favor one direction over the other (depending on VH Thresh) while lower values will give smoother blending.

**0x1AE80**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x0000005D	Reserved
7:0	R/W		Sat Slope. Slope of saturation blending threshold in linear format 2.6

**0x1AE84**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00A00131	Reserved
27:16	R/W		AA Thresh. Threshold for the range of angular (45/135) blending. The threshold defines the difference of 45 and 135 gradients at which the 45 gradient will start to be taken into account in the blending (if AA Offset is set to 0). Setting the offset not null (or the slope low) will include proportion of the 45 gradient in the blending before even the gradient difference reaches the threshold (see AA Offset for more details).
15:12	R/W		Reserved
11:0	R/W		VH Thresh. Threshold for the range of vertical/horizontal blending The threshold defines the difference of vertical and horizontal gradients at which the vertical gradient will start to be taken into account in the blending (if VH Offset is set to 0). Setting the offset not null (or the slope low) will include proportion of the vertical gradient in the blending before even the gradient difference reaches the threshold (see VH Offset for more details).

**0x1AE88**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01710070	Reserved
27:16	R/W		UU Thresh. Threshold for the range of undefined blending
15:12	R/W		Reserved
11:0	R/W		VA Thresh. Threshold for the range of VH-AA blending. The threshold defines the difference of VH and AA gradients at which the VH gradient will start to be taken into account in the blending (if VA Offset is set to 0). Setting the offset not null (or the slope low) will include proportion of the VH gradient in the blending before even the gradient difference reaches the threshold (see VA Offset for more details).

**0x1AE8C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00600171	Reserved
27:16	R/W		Ium thresh. Luminance threshold for directional sharpening
15:12	R/W		Reserved
11:0	R/W		Sat Thresh. Threshold for the range of saturation blending in signed 2.9 format

**0x1AE90**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x08000800	Reserved
27:16	R/W		AA Offset. Offset for angular (A45/A135) blending threshold. This register has great impact on how AA Thresh is used. Setting this register to a value offset tells the blending process to weight the 45 and 135 gradients, at the threshold, with respectively offset/16 and 255 - (offset/16). If AA Thresh not equals to 0, these same blending weights apply from -AA Thresh to +AA Thresh
15:12	R/W		Reserved
11:0	R/W		VH Offset. Offset for vertical/horizontal blending threshold

**0x1AE94**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00000800	Reserved
27:16	R/W		UU Offset. Offset for undefined blending threshold
15:12	R/W		Reserved
11:0	R/W		VA Offset. Offset for VH-AA blending threshold. This register has great impact on how VA Thresh is used. Setting this register to a value offset tells the blending process to weight the VH and AA gradients, at the threshold, with respectively offset/16 and 255 - (offset/16). If VA Thresh not equals to 0, these same blending weights apply from -VA Thresh to +VA Thresh.

**0x1AE9C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x000002030	Reserved
23:16	R/W		np offset. Noise profile offset in logarithmic 4.4 format
15:8	R/W		sharp alt ud. Non-directional sharp mask strength in signed 4.4 format
7:0	R/W		sharp alt d. Directional sharp mask strength in signed 4.4 format

**0x1AEA0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0	Reserved

Bit(s)	R/W	Default	Description
31:13	R/W	0x00001F48	Reserved
12:0	R/W		min ud strength. Min threshold for the un-directional L_Lu in signed 2's complement s.12 format

**0x1AEBC**

Bit(s)	R/W	Default	Description
31:1	R/W	0x00000001	Reserved
0	R/W		<b>sharpen alg select.</b> To select new sharp algorithm or not

**0x1AEC0**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00080880	Reserved
23:16	R/W		grey det thresh. Threshold applied to the inter-channel difference for detecting grey region
15:8	R/W		lg det thresh. Level to which the green channel is considered low in which case the gradient is calculated using only the blue and red channels
7:0	R/W		UU SH Slope. Slope of undefined blending threshold in 4.4 logarithmic format

**0x1AEC4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00000008	Reserved
27:16	R/W		UU SH Offset. Offset for undefined blending threshold
15:12	R/W		Reserved
11:0	R/W		UU SH Thresh. Threshold for the range of undefined blending

**0x1AEC8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x10688000	grey det slope. Control the ramp of the linear thresholding for the grey detector
15:0	R/W		lg det slope. Control the ramp of the linear thresholding for the low green detector

**0x1AECC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29	R/W	0x03330333	Reserved
28:16	R/W		max ud strength. Max threshold for the undirectional L_Lu in signed 2's complement s1+0.12 format
15:13	R/W		Reserved
12:0	R/W		max d strength. Max threshold for the directional L_L in signed 2's complement s1+0.12 format

**0x1AED0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000008	Reserved
23:16	R/W		luma offset low d. Linear threshold offset corresponding to luma_thresh_low_d
15:12	R/W		Reserved
11:0	R/W		luma thresh low d. Intensity values above this value will be sharpen

**0x1AED4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0x00004000	Reserved
19:0	R/W		luma slope low d. Linear threshold slope corresponding to luma_thresh_low_d

**0x1AED8**

Bit(s)	R/W	Default	Description
31:28	R/W	0x0FA00000	Reserved
27:16	R/W		luma thresh high d. Intensity values below this value will be sharpen
15:0	R/W		Reserved

**0x1AEDC**

Bit(s)	R/W	Default	Description
31:20	R/W	0x00004000	Reserved
19:0	R/W		luma slope high d. Linear threshold slope corresponding to luma_thresh_high_d

**0x1AEE0**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00000008	Reserved
23:16	R/W		luma offset low ud. Linear threshold offset corresponding to luma_thresh_low_ud
15:12	R/W		Reserved
11:0	R/W		luma thresh low ud. Intensity values above this value will be sharpen

**0x1AEE4**

Bit(s)	R/W	Default	Description
31:20	R/W	0x00004000	Reserved
19:0	R/W		luma slope low ud. Linear threshold slope corresponding to luma_thresh_low_ud

**0x1AEE8**

Bit(s)	R/W	Default	Description
31:12	R/W	0x00000FA0	Reserved
11:0	R/W		luma thresh high ud. Intensity values below this value will be sharpen

**0x1AEEC**

Bit(s)	R/W	Default	Description
31:20	R/W	0x00004000	Reserved
19:0	R/W		luma slope high ud. Linear threshold slope corresponding to luma_thresh_high_ud

**demosaic rgb Noise Profile**

Bayer Demosaic lookup

This is an array of 128 8-bit registers. The address for element (i) is: 0x1AEF0 + 4 \* int(i / 4).

Address	Bit(s)	R/W	Default	Description
0x1AEF0	31:24	R/W	-	Weight lut(3). Noise profile LUT.
	23:16	R/W	-	Weight lut(2). Noise profile LUT.

11	R/W	0	axi xact comp. 0 = dont wait for axi transaction completion at end of frame(just all transfers accepted). 1 = wait for all transactions completed
10	R/W	0	Reserved
9	R/W	0	frame write on. 0 = no frames written(when switched from 1, current frame completes writing before stopping). 1= write frame(s) (write single or continuous frame(s) )
8	R/W	0	Reserved
7:6	R/W	0	Plane select. Plane select for planar base modes. Only used if planar outputs required. Not used. Should be set to 0
5	R/W	0	Reserved
4:0	R/W	0	Base mode. Base DMA packing mode for RGB/RAW/YUV etc

**0x1C0F0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x04380780	active height. Active video height in lines 128-8000
15:0	R/W		active width. Active video width in pixels 128-8000

**0x1C0F4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank0 base. bank 0 base address for frame buffer, should be word-aligned

**0x1C0F8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank1 base. bank 1 base address for frame buffer, should be word-aligned

**0x1C0FC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank2 base. bank 2 base address for frame buffer, should be word-aligned

**0x1C100**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank3 base. bank 3 base address for frame buffer, should be word-aligned

**0x1C104**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank4 base. bank 4 base address for frame buffer, should be word-aligned

**0x1C108**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R/W	0	Reserved
2:0	R/W	0	max bank. highest bank*_base to use for frame writes before recycling to bank0_base, only 0 to 4 are valid

**0x1C10C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Line offset

**0x1C110**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	RO	-	Reserved
3:1	RO		wbank curr. write bank currently active. valid values =0-4. updated at start of frame write
0	RO		wbank active. 1 = wbank_curr is being written to. Goes high at start of writes, low at last write transfer/completion on axi.

**0x1C11C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RO	-	frame wcount. count of outgoing frame writes (starts) from vdma_writer sent to AXI output, non resetable, rolls over, updates at pixel 1 of new frame on video in
15:0	RO		frame icount. count of incoming frames (starts) to vdma_writer on video input, non resetable, rolls over, updates at pixel 1 of new frame on video in

**0x1C124**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	RO	-	Reserved
8	RO	-	video alarm. active high, problem found on video port(s) ( active width/height or interline/frame blanks failure)
7	RO	-	vi fail interframe blanks. clearable alarm, high to indicate interframe blanking below min
6	RO	-	vi fail interline blanks. clearable alarm, high to indicate interline blanking below min
5	RO	-	vi fail active height. clearable alarm, high to indicate mismatched active_height detected ( also raised on missing field!)
4	RO	-	vi fail active width. clearable alarm, high to indicate mismatched active_width detected
3	RO	-	axi fail wxact ostand. clearable alarm, high when wxact_ostand_limit reached
2	RO	-	axi fail wmaxwait. clearable alarm, high when wmaxwait_limit reached
1	RO	-	axi fail awmaxwait. clearable alarm, high when awmaxwait_limit reached
0	RO	-	axi fail bresp. clearable alarm, high to indicate bad bresp captured

**0x1C128**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	<p>blk status. block status output (reserved)</p> <ul style="list-style-type: none"> <li>- blk_status(0) = wfifo_fail_full</li> <li>- blk_status(1) = wfifo_fail_empty</li> <li>- blk_status(4) = pack_fail_overflow</li> <li>- blk_status(24) = intw_fail_user_intfcsig</li> <li>- blk_status(others) = zero</li> </ul>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	lines wrapped. Number of lines to write from base address before wrapping back to base address. 0 = no wrapping, >0 = last line written before wrapping

**0x1C130**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick first. Line number of first linetick. 0 = no linetick, >0 = line number to generate linetick

**0x1C134**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick repeat. Line repeat interval of linetick. 0 = no repeat, >0 = repeat interval in lines

**0x1C138**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	<p>linetick delay. Linetick delay in vcke cycles to add to min 3 cycle latency from acl_vi. 0-65535.</p> <p>Must be less than next linetick generation time or count will not mature and no linetick is not produced.</p> <p><b>Note:</b></p> <p><i>linetick delay can run past end of frame/field and also into next frame!</i></p> <ul style="list-style-type: none"> <li>• Take care maturity time is less than next configured linetick generation position!</li> <li>• Take care when changing config between frame too!</li> </ul>
15:1	R/W	0	Reserved
0	R/W	0	linetick eol. Linetick start/end of line control. 0 = use start of line, 1 = use end of line to generate linetick

**0x1C13C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R/W	0x0F000F0C	Reserved
1	R/W		axi id multi. 0= static value (axi_id_value) for awid/wid, 1 = incrementing value per transaction for awid/wid wrapping to 0 after axi_id_value
0	R/W		Reserved

**0x1C140**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0	Reserved
3:0	R/W	0	axi id value. value to send for awid, wid and expected on bid. Good default = 0000

**fr uv dma writer**

DMA writer controls

**0x1C144**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11	R/W	0	axi xact comp. 0 = dont wait for axi transaction completion at end of frame(just all transfers accepted). 1 = wait for all transactions completed
10	R/W	0	Reserved
9	R/W	0	frame write on. 0 = no frames written(when switched from 1, current frame completes writing before stopping), 1= write frame(s) (write single or continous frame(s) )
8	R/W	0	Reserved
7:6	R/W	0	Plane select. Plane select for planar base modes. Only used if planar outputs required. Not used. Should be set to 0
5	R/W	0	Reserved
4:0	R/W	0	Base mode. Base DMA packing mode for RGB/RAW/YUV etc

**0x1C148**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W		active height. Active video height in lines 128-8000
15:0	R/W	0x04380780	active width. Active video width in pixels 128-8000

**0x1C14C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank0 base. bank 0 base address for frame buffer, should be word-aligned

**0x1C150**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank1 base. bank 1 base address for frame buffer, should be word-aligned

**0x1C154**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank2 base. bank 2 base address for frame buffer, should be word-aligned

**0x1C158**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank3 base. bank 3 base address for frame buffer, should be word-aligned

**0x1C15C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank4 base. bank 4 base address for frame buffer, should be word-aligned

**0x1C160**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R/W	0	Reserved
2:0	R/W	0	max bank. highest bank*_base to use for frame writes before recycling to bank0_base, only 0 to 4 are valid

**0x1C164**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Line offset. Indicates the offset in bytes from the start of one line to the next line. This value should be equal to or larger than one line of image data and should be word-aligned

**0x1C168**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	RO	-	Reserved
3:1	RO	-	wbank curr. write bank currently active. valid values =0-4. updated at start of frame write
0	RO	-	wbank active. 1 = wbank_curr is being written to. Goes high at start of writes, low at last write transfer/completion on axi.

**0x1C174**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RO	-	frame wcount. count of outgoing frame writes (starts) from vdma_writer sent to AXI output, non resetable, rolls over, updates at pixel 1 of new frame on video in
15:0	RO	-	frame icount. count of incoming frames (starts) to vdma_writer on video input, non resetable, rolls over, updates at pixel 1 of new frame on video in

**0x1C17C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	RO	-	Reserved
8	RO	-	video alarm. active high, problem found on video port(s) ( active width/height or interline/frame blanks failure)
7	RO	-	vi fail interframe blanks. clearable alarm, high to indicate interframe blanking below min
6	RO	-	vi fail interline blanks. clearable alarm, high to indicate interline blanking below min
5	RO	-	vi fail active height. clearable alarm, high to indicate mismatched active_height detected ( also raised on missing field!)
4	RO	-	vi fail active width. clearable alarm, high to indicate mismatched active_width detected
3	RO	-	axi fail wxact_ostand. clearable alarm, high when wxact_ostand_limit reached
2	RO	-	axi fail wmaxwait. clearable alarm, high when wmaxwait_limit reached
1	RO	-	axi fail awmaxwait. clearable alarm, high when awmaxwait_limit reached
0	RO	-	axi fail bresp. clearable alarm, high to indicate bad bresp captured

**0x1C180**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	blk status. block status output (reserved) - blk_status(0) = wfifo_fail_full - blk_status(1) = wfifo_fail_empty - blk_status(4) = pack_fail_overflow - blk_status(24) = intw_fail_user_intfc_sig - blk_status(others) = zero

**0x1C1E4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	offset g. Offset subtracted from the G channel
15:12	R/W	0	Reserved
11:0	R/W	0	offset r. Offset subtracted from the R channel

**0x1C1E8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11:0	R/W	0	offset b. Offset subtracted from the B channel

**ds sharpen**

Sharpen

Luma transform red coefficient. u0.8

Luma transform blue coefficient. u0.8

**0x1C1EC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0	Reserved
0	R/W	0	Enable. Sharpening enable: 0=off, 1=on

**0x1C1F0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/W		Reserved
8:0	R/W	0x00000010	Strength. Controls strength of sharpening effect. u5.4

**0x1C1F4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00131E4C	Reserved
23:16	R/W		Alpha Undershoot. Alpha blending of undershoot and overshoot u0.7, 0 = only undershoot, 255 = only overshoot
15:8	R/W		Control B
7:0	R/W		Control R

**0x1C1F8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	Reserved
23:16	R/W	0	Luma Offset Low. Luma offset (min value) of thre region of less than Luma Thresh Low.
15:10	R/W	0	Reserved
9:0	R/W	0	Luma Thresh Low. Luma threshold below this value, no sharpening will be applied.

**0x1C1FC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26	R/W	0x033203FC	Reserved
25:16	R/W		Luma Thresh High. Luma threshold above this value, sharpening level will be dicreased.
15:0	R/W		Luma Slope Low. Luma linear threshold slope at dark luminance region

**0x1C200**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06A40000	Luma Slope High. Luma linear threshold slope at bright luminance region
15:8	R/W		Reserved
7:0	R/W		Luma Offset High. Luma offset (min value) of thre region of more than Luma Thresh High.

**0x1C204**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0x00CD3FFF	Reserved
29:16	R/W		Clip Str Min. clips sharpening mask of min value. This will control undershoot. U0.14. It is used as negative value. (0 ~ -16383)
15:14	R/W		Reserved
13:0	R/W		Clip Str Max. clips sharpening mask of max value. This will control overshoot. U0.14. (0 ~ 16383)

**0x1C208**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0	Reserved
3:0	R/W	0	Debug. To support different debug output. 0 = normal operation, 1 = luma, 2 = sharpening mask

**ds cs conv**

Conversion of RGB to YUV data using a 3x3 color matrix plus offsets

**0x1C20C**

Bit(s)	R/W	Default	Description
31:4	R/W	0	Reserved
3	R/W	0	Enable vertical downsample
2	R/W	0	Enable horizontal downsample
1	R/W	0	Enable filter
0	R/W	0	Enable matrix. Color matrix enable: 0=off 1=on

**0x1C210**

Bit(s)	R/W	Default	Description
31:16	R/W	0x0000002F	Reserved
15:0	R/W		Coefft 11. Matrix coefficient for R-Y multiplier. Format: sign/magnitude 8.8-bit fixed-point

31:16	R/W	0x00008066	Reserved
15:0	R/W		Coefft 32. Matrix coefficient for G-Cr multiplier. Format: sign/magnitude 8.8-bit fixed-point

**0x1C230**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x0000800A	Reserved
15:0	R/W		Coefft 33. Matrix coefficient for B-Cr multiplier. Format: sign/magnitude 8.8-bit fixed-point

**0x1C234**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:11	R/W	0	Reserved
10:0	R/W	0	Coefft o1. Offset for Y. Format: signed (2's complement) 11-bit integer

**0x1C238**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:11	R/W	0x00000200	Reserved
10:0	R/W		Coefft o2. Offset for Cb. Format: signed (2's complement) 11-bit integer

**0x1C23C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:11	R/W	0x00000200	Reserved
10:0	R/W		Coefft o3. Offset for Cr. Format: signed (2's complement) 11-bit integer

**0x1C240**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0	Reserved
9:0	R/W	0	Clip min Y. Minimal value for Y. Values below this are clipped. Format: signed (2's complement) 10-bit integer

**0x1C244**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x000003FF	Reserved
9:0	R/W		Clip min Y. Minimal value for Y. Values below this are clipped. Format: signed (2's complement) 10-bit integer

**0x1C248**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0	Reserved
9:0	R/W	0	Clip min UV. Minimal value for Cb, Cr. Values below this are clipped. Format: signed (2's complement) 10-bit integer

**0x1C24C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x000003FF	Reserved
9:0	R/W		Clip max UV. Maximal value for Cb, Cr. Values above this are clipped. Format: signed (2's complement) 10-bit integer

**0x1C250**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x0000003FF	Reserved
9:0	R/W		Data mask RY. Data mask for channel 1 (R or Y). Bit-wise and of this value and video data.

**0x1C254**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x0000003FF	Reserved
9:0	R/W		Data mask GU. Data mask for channel 2 (G or U). Bit-wise and of this value and video data.

**0x1C258**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x0000003FF	Reserved
9:0	R/W		Data mask BV. Data mask for channel 3 (B or V). Bit-wise and of this value and video data.

**ds cs conv dither****0x1C25C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:5	R/W	0	Reserved
4	R/W	0	Shift mode. 0=output is LSB aligned; 1=output is MSB aligned
3	R/W	0	Reserved
2:1	R/W	0	Dither amount. 0=dither to 9 bits; 1=dither to 8 bits; 2=dither to 7 bits; 3=dither to 6 bits
0	R/W	0	Enable dither. Enables dithering module

**ds dma writer**

DMA writer controls

**0x1C260**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11	R/W	0	axi xact comp. 0 = dont wait for axi transaction completion at end of frame(just all transfers accepted). 1= wait for all transactions completed
10	R/W	0	Reserved

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
9	R/W	0	frame write on. 0 = no frames written(when switched from 1, current frame completes writing before stopping), 1= write frame(s) (write single or continuous frame(s) )
8	R/W	0	Reserved
7:6	R/W	0	Plane select. Plane select for planar base modes. Only used if planar outputs required. Not used. Should be set to 0
5	R/W	0	Reserved
4:0	R/W	0	Base mode. Base DMA packing mode for RGB/Raw/YUV etc

**0x1C264**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x04380780	active height. Active video height in lines 128-8000
15:0	R/W		active width. Active video width in pixels 128-8000

**0x1C268**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank0 base. bank 0 base address for frame buffer, should be word-aligned

**0x1C26C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank1 base. bank 1 base address for frame buffer, should be word-aligned

**0x1C270**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank2 base. bank 2 base address for frame buffer, should be word-aligned

**0x1C274**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank3 base. bank 3 base address for frame buffer, should be word-aligned

**0x1C278**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank4 base. bank 4 base address for frame buffer, should be word-aligned

**0x1C27C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R/W	0	Reserved
2:0	R/W	0	max bank. highest bank*_base to use for frame writes before recycling to bank0_base, only 0 to 4 are valid

**0x1C280**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0x00001000	Line offset. Indicates the offset in bytes from the start of one line to the next line. This value should be equal to or larger than one line of image data and should be word-aligned

**0x1C284**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	RO	-	Reserved
3:1	RO	-	wbank curr. write bank currently active. valid values =0-4. updated at start of frame write
0	RO	-	wbank active. 1 = wbank_curr is being written to. Goes high at start of writes, low at last write transfer/completion on axi.

**0x1C290**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RO	-	frame wcount. count of outgoing frame writes (starts) from vdma_writer sent to AXI output, non resetable, rolls over, updates at pixel 1 of new frame on video in
15:0	RO	-	frame icount. count of incomming frames (starts) to vdma_writer on video input, non resetable, rolls over, updates at pixel 1 of new frame on video in

**0x1C298**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	RO	-	Reserved
8	RO	-	video alarm. active high, problem found on video port(s) ( active width/height or interline/frame blanks failure)
7	RO	-	vi fail interframe blanks. clearable alarm, high to indicate interframe blanking below min
6	RO	-	vi fail interline blanks. clearable alarm, high to indicate interline blanking below min
5	RO	-	vi fail active height. clearable alarm, high to indicate mismatched active_height detected ( also raised on missing field!)
4	RO	-	vi fail active width. clearable alarm, high to indicate mismatched active_width detected

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
3	RO	-	axi fail wxact_ostand. clearable alarm, high when wxact_ostand_limit reached
2	RO	-	axi fail wmaxwait. clearable alarm, high when wmaxwait_limit reached
1	RO	-	axi fail awmaxwait. clearable alarm, high when awmaxwait_limit reached
0	RO	-	axi fail bresp. clearable alarm, high to indicate bad bresp captured

**0x1C29C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	blk status. block status output (reserved) - blk_status(0) = wfifo_fail_full - blk_status(1) = wfifo_fail_empty - blk_status(4) = pack_fail_overflow - blk_status(24) = intw_fail_user_intfcsig - blk_status(others) = zero

**0x1C2A0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	lines wrapped. Number of lines to write from base address before wrapping back to base address. 0 = no wrapping, >0 = last line written before wrapping

**0x1C2A4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick first. Line number of first linetick. 0 = no linetick, >0 = line number to generate linetick

**0x1C2A8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick repeat. Line repeat interval of linetick. 0 = no repeat, >0 = repeat interval in lines

**0x1C2AC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	linetick delay. Linetick delay in vcke cycles to add to min 3 cycle latency from acl_vi. 0-65535.

Bit(s)	R/W	Default	Description
			<p>Must be less than next linetick generation time or count will not mature and no linetick is not produced.</p> <p><b>NOTE:</b></p> <p><i>Linetick delay can run past end of frame/field and also into next frame!</i></p> <ul style="list-style-type: none"> <li><i>Take care maturity time is less than next configured linetick generation position!</i></li> <li><i>Take care when changing config between frame too!</i></li> </ul>
15:1	R/W	0	Reserved
0	R/W	0	linetick eol. Linetick start/end of line control. 0 = use start of line, 1 = use end of line to generate linetick

**0x1C2B0**

Bit(s)	R/W	Default	Description
31:2	R/W	0x0F000FOC	Reserved
1	R/W		axi id multi. 0= static value (axi_id_value) for awid/wid, 1 = incrementing value per transaction for awid/wid wrapping to 0 after axi_id_value
0	R/W		Reserved

**0x1C2B4**

Bit(s)	R/W	Default	Description
31:4	R/W	0	Reserved
3:0	R/W	0	axi id value. value to send for awid, wid and expected on bid. Good default = 0000

**ds uv dma writer**

DMA writer controls

**0x1C2B8**

Bit(s)	R/W	Default	Description
31:12	R/W	0	Reserved
11	R/W	0	axi xact comp. 0 = dont wait for axi transaction completion at end of frame(just all transfers accepted). 1= wait for all transactions completed
10	R/W	0	Reserved
9	R/W	0	frame write on. 0 = no frames written(when switched from 1, current frame completes writing before stopping), 1= write frame(s) (write single or continuous frame(s) )
8	R/W	0	Reserved
7:6	R/W	0	Plane select. Plane select for planar base modes. Only used if planar outputs required. Not used. Should be set to 0

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5	R/W	0	Reserved
4-0	R/W	0	Base mode. Base DMA packing mode for RGB/Raw/YUV etc

**0x1C2BC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x04380780	active height. Active video height in lines 128-8000
15:0	R/W		active width. Active video width in pixels 128-8000

**0x1C2C0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank0 base. bank 0 base address for frame buffer, should be word-aligned

**0x1C2C4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank1 base. bank 1 base address for frame buffer, should be word-aligned

**0x1C2C8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank2 base. bank 2 base address for frame buffer, should be word-aligned

**0x1C2CC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank3 base. bank 3 base address for frame buffer, should be word-aligned

**0x1C2D0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Bank4 base. bank 4 base address for frame buffer, should be word-aligned

**0x1C2D4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R/W	0	Reserved
2:0	R/W	0	max bank. ghost bank*_base to use for frame writes before recycling to bank0_base, only 0 to 4 are valid

**0x1C2D8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0x00001000	Line offset. Indicates the offset in bytes from the start of one line to the next line. This value should be equal to or larger than one line of image data and should be word-aligned

**0x1C2DC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	RO	-	Reserved
3:1	RO	-	wbank curr. write bank currently active. valid values =0-4. updated at start of frame write
0	RO	0	wbank active. = wbank_curr is being written to. Goes high at start of writes, low at last write transfer/completion on axi.

**0x1C2E8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RO	-	frame wcount. count of outgoing frame writes (starts) from vdma_writer sent to AXI output, non resetable, rolls over, updates at pixel 1 of new frame on video in
15:0	RO	-	frame icount. count of incomming frames (starts) to vdma_writer on video input, non resetable, rolls over, updates at pixel 1 of new frame on video in

**0x1C2F0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	RO	-	Reserved
8	RO	-	video alarm. active high, problem found on video port(s) ( active width/height or interline/frame blanks failure)
7	RO	-	vi fail interframe blanks. clearable alarm, high to indicate interframe blanking below min
6	RO	-	vi fail interline blanks. clearable alarm, high to indicate interline blanking below min
5	RO	-	vi fail active height. clearable alarm, high to indicate mismatched active_height detected ( also raised on missing field!)
4	RO	-	vi fail active width. clearable alarm, high to indicate mismatched active_width detected
3	RO	-	axi fail wxact ostand. clearable alarm, high when wxact_ostand_limit reached
2	RO	-	axi fail wmaxwait. clearable alarm, high when wmaxwait_limit reached
1	RO	-	axi fail awmaxwait. clearable alarm, high when awmaxwait_limit reached
0	RO	-	axi fail bresp. clearable alarm, high to indicate bad bresp captured

**0x1C2F4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	<p>blk status. block status output (reserved)</p> <ul style="list-style-type: none"> <li>- blk_status(0) = wfifo_fail_full</li> <li>- blk_status(1) = wfifo_fail_empty</li> <li>- blk_status(4) = pack_fail_overflow</li> <li>- blk_status(24) = intw_fail_user_intfc_sig</li> <li>- blk_status(others) = zero</li> </ul>

**0x1C2F8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	lines wrapped. Number of lines to write from base address before wrapping back to base address. 0 = no wrapping, >0 = last line written before wrapping

**0x1C2FC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick first. Line number of first linetick. 0 = no linetick, >0 = line number to generate linetick

**0x1C300**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick first. Line repeat interval of linetick. 0 = no repeat, >0 = repeat interval in lines

**0x1C304**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	<p>linetick delay. 15:1	R/W	0	Reserved
0	R/W	0	linetick eol. Linetick start/end of line control. 0 = use start of line, 1 = use end of line to generate linetick

**0x1C308**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R/W	0x0F000F0C	Reserved
1	R/W		axi id multi. 0= static value (axi_id_value) for awid/wid, 1 = incrementing value per transaction for awid/wid wrapping to 0 after axi_id_value
0	R/W		Reserved

**0x1C30C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0	Reserved
3:0	R/W	0	axi id value. value to send for awid, wid and expected on bid. Good default = 0000

multi ctx

**0x1C310**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0	Reserved
0	R/W	0	Config done. This signal is only required in multi-context mode Once configuration for ping/pong address space is done, MCU must write 1 into this address. This register is self-clearing. So the read-back will be 0

**METERING\_STATS\_PONG\_MEM Array**

This is an array of 6575 32-bit registers. The address for element (i) is: 0x1C470 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x1C470	31:0	R/W	-	Data(0)
0x1C474	31:0	R/W	-	Data(1)
...repeated until ...				
0x22B28	31:0	R/W	-	Data(6574)

**DECOMPANDER0\_PONG\_MEM Array**

This is an array of 33 32-bit registers. The address for element (i) is: 0x22B2C + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x22B2C	31:0	R/W	-	Data(0)
0x22B30	31:0	R/W	-	Data(1)
...repeated until ...				
0x22BAC	31:0	R/W	-	Data(32)

### **DECOMPANDER1\_PONG\_MEM Array**

This is an array of 257 32-bit registers. The address for element (i) is: 0x22BB0 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x22BB0	31:0	R/W	-	Data(0)
0x22BB4	31:0	R/W	-	Data(1)
...repeated until ...				
0x22FB0	31:0	R/W	-	Data(256)

### **DPC\_PONG\_MEM**

The content of the memory is {y-coord[11:0], x-coord[12:0]}. Phisical memory width is 25bits. the top-left corner of the frame is indicated by {1,1}.

#### **Array**

This is an array of 4096 32-bit registers. The address for element (i) is: 0x22FB4 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x22FB4	31:0	R/W	-	Data(0)
0x22FB8	31:0	R/W	-	Data(1)
...repeated until ...				
0x26FB0	31:0	R/W	-	Data(4095)

### **CA\_CORRECTION\_FILTER\_PONG\_MEM**

Cromatic aberration correction polyphase filter lookup table, 32 entries of 32 bits each. Each entry address corresponds to fractional part of the pixel displacement.

Each entry is four 8-bit filter coefficients in fix point format.

- Codes 0...128 correspond to values 0.0 ... 1.0 (with resolution 1/128)
- Codes 129...191 correspond to values 129/128 ... 191/128
- Codes 192...255 correspond to values -64/128 ... -1/128

#### **Array**

This is an array of 32 32-bit registers. The address for element (i) is: 0x26FB4 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x26FB4	31:0	R/W	-	Data(0)
0x26FB8	31:0	R/W	-	Data(1)
...repeated until ...				
0x27030	31:0	R/W	-	Data(31)

### **CA\_CORRECTION\_MESH\_PONG\_MEM**

Chromatic aberration correction coordinate lookup table, 8192 entries for tile displacement of 16 bits each. Each entry is 16 bits, 8 LSBs is X displacement of the tile and 8 MSBs is Y displacement. The coordinates are coded as two's complement, 3.5 fixed point.

#### **Array**

This is an array of 4096 32-bit registers. The address for element (i) is:  $0x27034 + 4i$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x27034	31:0	R/W	-	Data(0)
0x27038	31:0	R/W	-	Data(1)
...repeated until ...				
0x2B030	31:0	R/W	-	Data(4095)

### **MESH\_SHADING\_PONG\_MEM Array**

This is an array of 4096 32-bit registers. The address for element (i) is:  $0x2B034 + 4i$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x2B034	31:0	R/W	0	Data(0)
0x2B038	31:0	R/W	0	Data(1)
...repeated until ...				
0x2F030	31:0	R/W	0	Data(4095)

### **RADIAL\_SHADING\_PONG\_MEM**

4 banks of radial shading lookup tables - for R,G,B,Ir channels. The banks start at the addresses 0, 256, 512, 768.

Each bank has 129 entries for piecewise linear table, each entry occupies 32 bits, of which 16 least significant bits are encoding shading correction factor in 4.12 fix point format.

#### **Array**

This is an array of 897 32-bit registers. The address for element (i) is:  $0x2F034 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x2F034	31:0	R/W	-	Data(0)
0x2F038	31:0	R/W	-	Data(1)
...repeated until ...				
0x2FE34	31:0	R/W	-	Data(896)

### IRIDIX\_RP\_PONG\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x2FE38 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x2FE38	31:0	R/W	-	Data(0)
0x2FE3C	31:0	R/W	-	Data(1)
...repeated until ...				
0x30038	31:0	R/W	-	Data(128)

### IRIDIX\_FP1\_PONG\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x3003C + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x3003C	31:0	R/W	-	Data(0)
0x30040	31:0	R/W	-	Data(1)
...repeated until ...				
0x3023C	31:0	R/W	-	Data(128)

### FR\_GAMMA\_RGB\_PONG\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x30240 + 4i$ .

Address	Bit(s)	R/W	Default	Description
0x30240	31:0	R/W	-	Data(0)
0x30244	31:0	R/W	-	Data(1)
...repeated until ...				
0x30440	31:0	R/W	-	Data(128)

### DS\_GAMMA\_RGB\_PONG\_MEM Array

This is an array of 129 32-bit registers. The address for element (i) is:  $0x30444 + 4i$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x30444	31:0	R/W	-	Data(0)
0x30448	31:0	R/W	-	Data(1)
...repeated until ...				
0x30644	31:0	R/W	-	Data(128)

**LUMVAR\_STATS\_PONG\_MEM**

This is an array of 512 32-bit registers. The address for element (i) is: 0x30648 + 4i.

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x30648	31:0	R/W	-	Data(0)
0x3064C	31:0	R/W	-	Data(1)
...repeated until ...				
0x30E44	31:0	R/W	-	Data(511)

**ISP\_CONFIG\_PONG(SINGLE\_CONTEXT\_CONFIG)****Top**

Miscellaneous top-level ISP controls

**0x30E48**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Active Height. Active video height in lines
15:0	R/W	0	Active Width. Active video width in pixels

**0x30E4C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26	R/W	0x04380780	Reserved
25:24	R/W		Linear data src. Linear data src 0 = Sensor stitched and linear data directly coming from sensor 1 = linear data from frame stitch 2 = Sensor companded data linearised through decompander 3 = reserved
23:18	R/W		Reserved
17:16	R/W		Cfa pattern. The pixel arrangement of the CFA array on the sensor. Set in the Top register group and used by several blocks in the pipeline: 0 = RGGB 1 = reserved 2 = RLrGB 3 = RGlB
15:10	R/W		Reserved
9:8	R/W		RGGB start post mirror. Starting color of the rggb pattern for all the modules after mirror this must be same as RGGB start pre mirror if mirror is bypassed
7:2	R/W		Reserved
1:0	R/W		RGGB start pre mirror. Starting color of the rggb pattern for all the modules before mirror 0 = R Gr Gb B 1 = Gr R B Gb 2 = Gb B R Gr 3 = B Gb Gr R

**0x30E6C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:6	R/W	0	Reserved
5	R/W	0	Bypass frame stitch. Bypass frame stitching logic
4	R/W	0	Bypass gain wdr. Bypass gain wdr
3	R/W	0	Bypass sensor offset wdr. Bypass sensor offset wdr
2	R/W	0	Bypass decompander. Bypass front end decompander
1	R/W	0	Bypass input formatter. Bypass input formatter module.
0	R/W	0	Bypass video test gen. Bypass video test generator

**0x30E70**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:5	R/W	0x00000004	Reserved
4	R/W		Bypass defect pixel. Bypass static defect pixel
3	R/W		Bypass RAW frontend. Bypass RAW frontend (green equalization and dynamic defect pixel)
2	R/W		Bypass fe sqrt. Bypass square root function before raw frontend
1	R/W		Bypass frontend sensor offset. Bypass digital gain module
0	R/W		Bypass digital gain. Bypass digital gain module

**0x30E78**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R/W	0x00000004	Reserved
2	R/W		Bypass ca correction. Bypass chromatic abberation correction
1	R/W		Bypass temper
0	R/W		Bypass sinter

**0x30E7C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:7	R/W	0	Reserved
6	R/W	0	Bypass iridix
5	R/W	0	Bypass iridix gain
4	R/W	0	Bypass white balance
3	R/W	0	Bypass mesh shading
2	R/W	0	Bypass radial shading
1	R/W	0	Bypass sensor offset pre shading.
0	R/W	0	Bypass square be. Bypass backend square

**0x30E80**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0	Reserved
7	R/W	0	Bypass noneq u gamma
6	R/W	0	Bypass 3D lut
5	R/W	0	Bypass CNR
4	R/W	0	Bypass CCM
3	R/W	0	Bypass pf correction
2	R/W	0	Bypass demosaic rgbir
1	R/W	0	Bypass demosaic rgb
0	R/W	0	Bypass mirror

**0x30E84**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0	Reserved
3	R/W	0	Bypass fr cs conv
2	R/W	0	Bypass fr sharpen
1	R/W	0	Bypass fr gamma rgb
0	R/W	0	Bypass fr crop

**0x30E88**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:5	R/W	0	Reserved
4	R/W	0	Bypass ds cs conv
3	R/W	0	Bypass ds sharpen
2	R/W	0	Bypass ds gamma rgb
1	R/W	0	Bypass ds scaler
0	R/W	0	Bypass ds crop

**0x30E8C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0	Reserved
9:8	R/W	0	<p>ISP processing fr bypass mode. ISP FR bypass modes. For debug purposes only. Should be set to 0 during normal operation. Used to bypass entire ISP after input port or to pass the stitched image directly to the output.</p> <p>0 = Full processing 1 = Bypass entire ISP processing and output [19:4] of raw sensor data After video test gen 2 = Bypass entire ISP processing and output LSB 10-bits bits of raw sensor data After video test gen. Data must be MSB aligned 3 = Reserved</p>
7:2	R/W	0	Reserved
1	R/W	0	<p>ISP downscale pipe disable. 0: Downscale pipeline is enabled 1: Downscale pipeline is disabled. No data is sent out in DMA and streaming channel</p> <p>0 = Select processed. 1 = Bypass ISP RAW processing.</p>
0	R/W	0	<p>ISP RAW bypass. Used to select between normal ISP processing with image sensor data and up to 12 bit RGB input. In the latler case data is reinserted into pipeline after purple fringing correction block.</p> <p>0 = Select processed. 1 = Bypass ISP RAW processing.</p>

**0x30E90**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:25	R/W	0x00010000	Reserved
24	R/W		aexp src. 0 = After static white balance when applied before shading 1 = After static white balance when applied after shading
23:20	R/W		Reserved
19	R/W		Lumavar switch. Luma variance tap in the pipeline. 0 = Full resolution pipeline 1 = Downscaled pipeline
18	R/W		Lumavar Disable. 0 = Enabled 1 = Disabled
17	R/W		Reserved

Bit(s)	R/W	Default	Description
16	R/W		iHist disable. Post iridix histogram enable. Enables statistics gathering for global histogram 0 = Enabled 1 = Disabled
15	R/W		Reserved
14:13	R/W		AEXP Histogram switch. AE global histogram tap in the pipeline. Location of statistics gathering for 1024 bin global histogram 0 = After static white balance whose position is selected by aexp_src signal 1 = After WDR Frame Stitch. If its sensor companded data, then use decompanded output. If its sensor linearised data, then use it directly 2 = After VTPG 3 = reserved
12	R/W		AEXP hist disable. 0: AEXP 1024-bin histogram enabled 1: AEXP 1024-bin histogram disabled
11:10	R/W		Reserved
9	R/W		AWB switch. AWB tap in the pipeline. Location of AWB statistics collection. 0 = Immediately after demosaic 1 = Immediately after CNR
8	R/W		AWB disable. 0: AWB enabled 1: AWB disabled
7:6	R/W		Reserved
5	R/W		AF switch. AF tap in the pipeline. . 0 = After Sinter 1 = before Sinter
4	R/W		AF disable. 0: AF enabled 1: AF disabled
3	R/W		Reserved
2:1	R/W		AE switch. AE 5bin histogram tap in the pipeline. Location of AE statistic collection. 0 = After static white balance whose position is selected by aexp_src signal 1 = After WDR Frame Stitch. If its sensor companded data, then use decompanded output. If its sensor linearised data, then use it directly 2 = After VTPG 3 = reserved
0	R/W		AE 5bin hist disable. 0: AEXP 5-bin histogram enabled

Bit(s)	R/W	Default	Description
			1: AEXP 5-bin histogram disabled

**crossbar****0x30E94**

Bit(s)	R/W	Default	Description
31:26	R/W	0x03020100	Reserved
25:24	R/W		channel4 select. Channel4 selection from the input 4 channels
23:18	R/W		Reserved
17:16	R/W		Channel3 select. Channel2 selection from the input 4 channels
15:10	R/W		Reserved
9:8	R/W		Channel2 select. Channel1 selection from the input 4 channels
7:2	R/W		Reserved
1:0	R/W		Channel1 select. channel0 selection from the input 4 channels

**video test gen ch0**

Video test generator controls.

**0x30E98**

Bit(s)	R/W	Default	Description
31:4	R/W	0	Reserved
3	R/W	0	Generate mode. 0 = One Shot (on request) generation. 1 = free run (continuous) generation
2	R/W	0	bayer rgb o sel. Bayer or rgb select for output video: 0=bayer, 1=rgb
1	R/W	0	bayer rgb i sel. Bayer or rgb select for input video: 0=bayer, 1=rgb
0	R/W	0	test pattern off on. Test pattern off-on: 0=off, 1=on

**0x30E9C**

Bit(s)	R/W	Default	Description
31:8	R/W	0x00000003	Reserved
7:0	R/W		pattern type. Pattern type select: 0=Flat field,1=Horizontal gradient,2=Vertical Gradient,3=Vertical Bars,4=Rectangle,5-255=Default white frame on black

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0x0008FFFF	Reserved
19:0	R/W		g foregnd. Green foreground value 16bit, MSB aligned to used width

**0x30F44**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0x0008FFFF	Reserved
19:0	R/W		b foregnd. Blue foreground value 16bit, MSB aligned to used width

**0x30F48**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00003CAA	Reserved
15:0	R/W		rgb gradient. RGB gradient increment per pixel (0-15) for first channel Format: unsigned 4.12-bit fixed-point

**0x30F4C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	rgb gradient start. RGB gradient start value for first channel 16bit, MSB aligned to used width

**0x30F50**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0x01000001	Reserved
29:16	R/W		rect bot. Rectangle top line number 1-n
15:14	R/W		Reserved
13:0	R/W		rect top. Rectangle bottom line number 1-n

**0x30F54**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0x01000001	Reserved
29:16	R/W		rect right. Rectangle right pixel number 1-n
15:14	R/W		Reserved
13:0	R/W		rect left. Rectangle left pixel number 1-n

**input formatter**

Adapts received data format to ISP format. See following table of setting to be used for various sensors/modes.

<b>Sensor mode</b>	<b>Description</b>
Linear data	Up to 20 bits and MSB aligned.
Sensor companded data	Up to 16 bits and MSB aligned.
3-2 exposures wdr: 16bit Linear + 12bit VS	Supported companded data widths are: 8, 10, 12, 14, 16

3-2 exposures wdr: 12bit companded + 12bit VS	OV2770 or equivalent.
3:2 mux mode	OV10640 3:2 mux mode
16-bit log mode	OV10640 16bit log mode

**0x30F58**

Bit(s)	R/W	Default	Description
31:19	R/W		Reserved
18:16	R/W	0x00020000	input bitwidth select. Input bitwidth select 0 = 8 bits 1 = 10 bits 2 = 12 bits 3 = 14 bits 4 = 16 bits 5 = 20 bits (no 18 bits) 6 = Reserved 7 = Reserved
15:3	R/W		Reserved
2:0	R/W		mode in. Input mode 0 = Linear data 1 = 2:3 multiple exposure multiplexing 2 = Logarithmic encoding 3 = Companding curve with knee points 4 = 16bit linear+ 12bit VS 5 = 12bit companded + 12bit VS 6 = Reserved 7 = pass through mode

**0x30F5C**

Bit(s)	R/W	Default	Description
31:18	R/W	0x00010000	Reserved
17:0	R/W		factor ML. 18 bit, 6.12 fix point - ratio between long and medium exposure for 2:3 multiplexed mode

**0x30F60**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:13	R/W	0x00010000	Reserved
12:0	R/W		factor MS. 13 bit, 1.12 fix point - ratio between short and medium exposure for 2:3 multiplexed mode

**0x30F64**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11:0	R/W	0	black level. Black level of sensor data for 2:3 multiplexed mode

**0x30F68**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x05800200	knee point1. Second knee point
15:0	R/W		knee point0. First knee point

**0x30F6C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00000881	Reserved
15:0	R/W		knee point2. Third knee point

**0x30F70**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x09060402	Reserved
27:24	R/W		slope3 select. Last slope for companding table segments (encoding is the same as slope0 select)
23:20	R/W		Reserved
19:16	R/W		Slope2 select. Third slope for companding table segments (encoding is the same as slope0 select)
15:12	R/W		Reserved
11:8	R/W		Slope1 select. Second slope for companding table segments (encoding is the same as slope0 select)
7:4	R/W		Reserved
3:0	R/W		slope0 select. First slope for companding table segments

Bit(s)	R/W	Default	Description
			0 = 1x 1 = 2x 2 = 4x 3 = 8x 4 = 16x 5 = 32x 6 = 64x 7 = 128x 8 = 256x 9 = 512x 10 = 1024x 11 = 2048x 12 = 4096x 13 = 8192x 14 = 16384x 15 = 32768x

**sensor offset wdr l**

offset offset subtraction for each color channel and exposure

**0x30F74**

Bit(s)	R/W	Default	Description
31:28	R/W	0	Reserved
27:16	R/W	0	offset 01. offset offset for color channel 01 (Gr)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x30F78**

Bit(s)	R/W	Default	Description
31:28	R/W	0	Reserved
27:16	R/W	0	offset 11. offset offset for color channel 11 (B)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**sensor offset wdr m**

offset offset subtraction for each color channel and exposure

**0x30F7C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Offset 01. offset offset for color channel 01 (Gr)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x30F80**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Offset 11. offset offset for color channel 11 (B)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**sensor offset wdr s**

offset offset subtraction for each color channel and exposure

**0x30F84**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Offset 01. offset offset for color channel 01 (Gr)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x30F88**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Offset 11. offset offset for color channel 11 (B)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**sensor offset wdr vs**

offset offset subtraction for each color channel and exposure

**0x30F8C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Offset 01. offset offset for color channel 01 (Gr)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x30F90**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Offset 11. offset offset for color channel 11 (B)
15:12	R/W	0	Reserved
11:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**gain wdr**

Gain adjustment for the WDR stitching

**0x30F94**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29	R/W	0x01000100	Reserved
28:16	R/W		Gain m. Gain applied to ch-medium data in 5.8 format
15:13	R/W		Reserved
12:0	R/W		Gain l. Gain applied to ch-long data in 5.8 format

**0x30F98**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29	R/W	0x01000100	Reserved
28:16	R/W		Gain vs. Gain applied to ch-vs data in 5.8 format
15:13	R/W		Reserved
12:0	R/W		Gain s. Gain applied to ch-short data in 5.8 format

**0x30F9C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	black level m. Sensor offset applied to ch-medium data
15:12	R/W	0	Reserved
11:0	R/W	0	black level l. Sensor offset applied to ch-long data

**0x30FA0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	black level vs. Sensor offset applied to ch-veryshort data
15:12	R/W	0	Reserved
11:0	R/W	0	black level s. Sensor offset applied to ch-short data

**frame stitch**

4-exposure wide-dynamic-range blending

**NOTE:**

If the WDR is configured to stitch 2 exposures, then the configuration must be done through the LM\_ pair the short exposures black level must be programmed through the med\_black\_level register so that the LM pair can be used.

**0x30FA4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:8	R/W	0	<p>output select. This register is only for debug purpose. for normal operation it must be kept in its default value (0)</p> <p>0 : normal stitched output 1 : long data routed out 2 : medium data routed out 4 : short data routed out 8 : very short data routed out 16: LM stitched output taken out 32: MS stitched output taken out 64: SVS stitched output taken out others: reserved</p>
7:2	R/W	0	Reserved
1:0	R/W	0	<p>mode in. 0 : 4-exposure 1 : 2-exposure 2 : 3-exposure 3 : 4-exposure</p>

**0x30FA8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01000100	Reserved
27:16	R/W		MS Exposure Ratio. Sets ratio between medium and short exposures - this must match the actual exposure ratio on the sensor Format: unsigned 6.6-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		LM Exposure Ratio. Sets ratio between long and medium exposures - this must match the actual exposure ratio on the sensor Format: unsigned 6.6-bit fixed-point

**0x30FAC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0x00000100	Reserved
11:0	R/W		SVS Exposure Ratio. Sets ratio between short and very short exposures - this must match the actual exposure ratio on the sensor Format: unsigned 6.6-bit fixed-point

**0x30FB0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C00F00	Reserved
27:16	R/W		LM Thresh low. Data below this threshold will be taken from long exposure only
15:12	R/W		Reserved
11:0	R/W		LM Thresh high. These two thresholds are for LM pairs. Both are with respect to the longer stitches. Data above this threshold will be taken from short exposure only

**0x30FB4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C000F00	Reserved
27:16	R/W		MS Thresh low. Data below this threshold will be taken from long exposure only
15:12	R/W		Reserved
11:0	R/W		MS Thresh high. These two thresholds are for MS pairs. Both are with respect to the longer stitches. Data above this threshold will be taken from short exposure only

**0x30FB8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C000F00	Reserved
27:16	R/W		SVS Thresh low. Data below this threshold will be taken from long exposure only
15:12	R/W		Reserved
11:0	R/W		SVS Thresh high. These two thresholds are for SVS pairs. Both are with respect to the longer stitches. Data above this threshold will be taken from short exposure only

**0x30FBC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Black level Medium. Black level for medium exposure input <b>NOTE:</b> <i>If the wdr unit is configured to use as 2-exposure, THIS REGISTER POSITION must contain the black level of short exposure as the LM pair is used for all other configurations</i>
15:12	R/W	0	Reserved
11:0	R/W	0	Black level long. Black level for long exposure input

**0x30FC0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Black level very Short. Black level for very short exposure input
15:12	R/W	0	Reserved
11:0	R/W	0	Black level Short. Black level for short exposure input

**0x30FC4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	Black level Out. Black level for module output

**0x30FC8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x06000180	Reserved
27:16	R/W		MS NP mult. The noise profile weights are multiplied by this value to give expected noise amplitude.
15:12	R/W		Reserved
11:0	R/W		LM NP mult. The noise profile weights are multiplied by this value to give expected noise amplitude.

**0x30FCC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0C000600	Reserved
27:16	R/W		LM Alpha MOV slope. This defines the gradient of the motion alpha ramp. Higher values mean a steeper ramp and so a more rapid transition between non-motion-corrected and motion-corrected regions.
15:12	R/W		Reserved
11:0	R/W		SVS NP mult. The noise profile weights are multiplied by this value to give expected noise amplitude.

**0x30FD0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01800180	Reserved
27:16	R/W		SVS Alpha MOV slope. This defines the gradient of the motion alpha ramp. Higher values mean a steeper ramp and so a more rapid transition between non-motion-corrected and motion-corrected regions.
15:12	R/W		Reserved
11:0	R/W		MS Alpha MOV slope. This defines the gradient of the motion alpha ramp. Higher values mean a steeper ramp and so a more rapid transition between non-motion-corrected and motion-corrected regions.

**0x30FD4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01000100	Reserved
27:16	R/W		Gain B. Multiplier for color channel B Format: unsigned 4.8-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		Gain R. Multiplier for color channel R Format: unsigned 4.8-bit fixed-point

**0x30FD8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0x00000100	Reserved
11:0	R/W		Consistency thresh mov. Pixel consistency reporting - motion threshold Format: unsigned 4.8-bit fixed-point

**0x30FDC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0x00080000	Reserved
19:0	R/W		Consistency thresh lvl. Pixel consistency reporting - flicker threshold Format: unsigned 4.8-bit fixed-point

**0x30FE0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:22	R/W	0	Reserved
21:16	R/W	0	Im neg weight. Higher values make it more likely to interpret differences between the long and medium exposures as noise (and thus do no motion correction).
15:14	R/W	0	Reserved
13:8	R/W	0	Im pos weight. Lower values make it more likely to interpret differences between the long and medium exposures as noise (and thus do no motion correction).
7:6	R/W	0	Reserved
5:0	R/W	0	Im noise thresh. Higher values make it more likely to interpret differences between the long and medium exposures as noise (and thus do no motion correction).

**0x30FE4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	Reserved
27:16	R/W	0	Im med noise intensity thresh
15:12	R/W	0	Reserved
11:0	R/W	0	Im med noise alpha thresh

**0x30FE8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:22	R/W	0	Reserved
21:0	R/W	0	Im mc blend slope

11:0	R/W	0	MCoff NC thresh high

**frame stitch NP LUT VS**

Noise profile for short exposure data at frame stitch

This is an array of 128 8-bit registers. The address for element (i) is:  $0x31024 + 4 * \text{int}(i / 4)$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x31024	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x31028	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x310A0	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

**frame stitch NP LUT S**

Noise profile for med2 exposure data at frame stitch

This is an array of 128 8-bit registers. The address for element (i) is:  $0x310A4 + 4 * \text{int}(i / 4)$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x310A4	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.

Address	Bit(s)	R/W	Default	Description
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x310A8	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.

### frame stitch NP LUT M

Noise profile for med1 exposure data at frame stitch

This is an array of 128 8-bit registers. The address for element (i) is:  $0x31124 + 4 * \text{int}(i / 4)$ .

Address	Bit(s)	R/W	Default	Description
0x31124	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x31128	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x311A0	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.

Address	Bit(s)	R/W	Default	Description
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

### frame stitch NP LUT L

This is an array of 128 8-bit registers. The address for element (i) is: 0x311A4 + 4 \* int(i / 4).

Address	Bit(s)	R/W	Default	Description
0x311A4	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x311A8	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x31220	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

### decompander0

Frontend lookup (for companded WDR sensor inputs)

#### 0x31224

Bit(s)	R/W	Default	Description
31:5	R/W	0	Reserved
4	R/W	0	Offset Mode. Lookup0 reflection mode for black offset region 0 = Manual curve reflection 1 = Automatic curve reflection
3:1	R/W	0	Reserved
0	R/W	0	Enable. Frontend lookup0 enable: 0=off 1=on

**decompander1**

Frontend lookup (for companded WDR sensor inputs)

**0x31228**

Bit(s)	R/W	Default	Description
31:5	R/W	0	Reserved
4	R/W	0	Offset Mode. Lookup0 reflection mode for black offset region 0 = Manual curve reflection 1 = Automatic curve reflection
3:1	R/W	0	Reserved
0	R/W	0	Enable. Frontend lookup0 enable: 0=off 1=on

**digital gain**

Digital gain for RAW sensor data

**0x3122C**

Bit(s)	R/W	Default	Description
31:12	R/W	0x00000100	Reserved
11:0	R/W		Gain. Gain applied to data in 4.8 format

**0x31230**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	Offset. Data black level

**sensor offset fe**

offset offset subtraction for each color channel and exposure

**0x31234**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x31238**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 01. offset offset for color channel 01 (Gr)

**0x3123C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**0x31240**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 11. offset offset for color channel 11 (B)

**sqrt**

sensor offset for the sqrt module

**0x31244**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	black level in. input Data black level

**0x31248**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	black level out. output Data black level

**raw frontend**

RAW frontend processing

**0x3124C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x00000005	Reserved
7	R/W		bright disable. Disable detection of bright pixels
6	R/W		dark disable. Disable detection of dark pixels
5:4	R/W		Reserved
3	R/W		show dynamic defect pixel. Show Defect Pixel: 0=off, 1=on
2	R/W		dp enable. Dynamic Defect Pixel enable: 0=off, 1=on
1	R/W		Reserved
0	R/W		ge enable. Green equalization enable: 0=off, 1=on

**0x31250**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	debug sel. Debug selection port

**0x31254**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00400200	Reserved
27:16	R/W		dp threshold. Defect pixel threshold.
15:12	R/W		Reserved
11:0	R/W		dp slope. Slope for HP Mask function

**0x31258**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000266	Reserved
23:16	R/W		dp blend. Controls blending between non-directional and directional replacement values in dynamic defect pixel correction. 0x00 Replace detected defects with non-directional replacement value 0xFF Replace detected defects with directional replacement value
15:0	R/W		dpdev threshold. Controls the aggressiveness of the dynamic defect pixel correction near edges.

**0x3125C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x04000000	ge threshold. green equalization threshold
15:8	R/W		Reserved
7:0	R/W		ge strength. Controls strength of Green equalization. Set during calibration.

**0x31260**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x008000AA	Reserved
23:16	R/W		ge sens. Controls the sensitivity of green equalization to edges.
15:12	R/W		Reserved
11:0	R/W		ge slope. Slope for GE Mask function

**0x31264**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00000150	Sigma In. Manual override of noise estimation
15:0	R/W		line thresh. Controls the directional nature of the dynamic defect pixel correction near edges.

**0x31268**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00003000	Reserved
15:8	R/W		Thresh Long. Noise threshold for long exposure data Format: unsigned 4.4-bit floating-point
7:0	R/W		Thresh Short. Noise threshold for short exposure data Format: unsigned 4.4-bit floating-point

**raw frontend np**

Noise profile controls for RAW frontend

**0x3126C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x0000FFFF	Reserved
15:0	R/W		Exp Thresh. Threshold for determining long/short exposure data

**0x31270**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x000000420	Reserved
15:8	R/W		Long Ratio. Multiplier applied to long exposure data for noise profile calculation Format: unsigned 6.2-bit fixed-point
7:0	R/W		Short Ratio. Multiplier applied to short exposure data for noise profile calculation Format: unsigned 6.2-bit fixed-point

**0x31274**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/W	0	Reserved
8	R/W	0	NP off reflect. Defines how values below black level are obtained. 0: Repeat the first table entry. 1: Reflect the noise profile curve below black level.
7	R/W	0	Reserved
6:0	R/W	0	NP off. Noise profile black level offset

**raw frontend np lut**

Noise profile controls for RAW frontend

This is an array of 128 8-bit registers. The address for element (i) is:  $0x31278 + 4 * \text{int}(i / 4)$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x31278	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x3127C	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x312F4	31:24	R/W	-	Weight lut(127) . Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126) . Noise profile LUT. Calculated during calibration process.

Address	Bit(s)	R/W	Default	Description
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

**defect pixel**

Detection and processing of static defect-pixels

**0x312FC**

Bit(s)	R/W	Default	Description
31:4	R/W	0	Reserved
3	R/W	0	Detection enable. Starts detection
2	R/W	0	Show Static Defect Pixels. Show which pixels have been detected as bad
1	R/W	0	Correction Enable. Correction enable: 0=off 1=on
0	R/W	0	Show Reference. For debug purposes. Show reference values which are compared with actual values to detect bad pixels

**0x31300**

Bit(s)	R/W	Default	Description
31:28	RO	-	Reserved
27:16	RO	-	Table Start. Address of first defect-pixel in defect-pixel store
15:13	RO	-	Reserved
12:1	RO	-	Defect Pixel Count. Number of defect-pixels detected
0	RO	-	Overflow. Table overflow flag

**0x31304**

Bit(s)	R/W	Default	Description
31:12	R/W	-	Reserved
11:0	R/W	-	Defect Pixel Count In. Number of defect-pixels in the written table

**sinter**

Spatial noise reduction

**0x31308**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x00000001C	Reserved
7	R/W		rm enable. Adjusts sinter strength radially from center to compensate for Lens shading correction. enable: 0=off, 1=on
6	R/W		Int select. Select intensity filter. Should not be modified from suggested values.
5	R/W		Filter select. Sinter filter fine tuning. Should not be modified from suggested values.
4	R/W	0	Enable Sinter enable: 0=off 1=on
3:0	R/W	0	Reserved.

**0x3130C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:6	R/W	0x000000034	Reserved
5	R/W		nonlinear wkgen. This config is only valid fr sinter3 Enables (1) or disables (0) nonlinear weight generation
4	R/W		nlm en. This config is only valid fr sinter3 Enables (1) or disables (0) the NLM filter
3:0	R/W		int config. Intensity blending with mosaic raw

**0x31310**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x000000009	Reserved
7:0	R/W		sad filt thresh. Block match difference filtering threshold

**0x31314**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x01680280	rm center y. Center y coordinate of shading map
15:0	R/W		rm center x. Center x coordinate of shading map

**0x31318**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x000000100	Reserved
15:0	R/W		rm off center mult. Normalizing factor which scales the radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x3131C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	Thresh 4h. Noise threshold for low horizontal spatial frequencies
23:16	R/W	0	Thresh 2h. Noise threshold for low horizontal spatial frequencies
15:8	R/W	0	Thresh 1h. Noise threshold for high horizontal spatial frequencies
7:0	R/W	0	Thresh 0h. Noise threshold for high horizontal spatial frequencies

**0x31320**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	Thresh 4v. Noise threshold for low vertical spatial frequencies
23:16	R/W	0	Thresh 2v. Noise threshold for low vertical spatial frequencies
15:8	R/W	0	Thresh 1v. Noise threshold for high vertical spatial frequencies
7:0	R/W	0	Thresh 0v. Noise threshold for high vertical spatial frequencies

**0x31324**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0xFFFFFFFF	Strength 4. Noise reduction effect for low spatial frequencies
23:16	R/W		Strength 2. Unused - no effect
15:8	R/W		Strength 1. Noise reduction effect for high spatial frequencies
7:0	R/W		Strength 0. Unused - no effect

**sinter Noise Profile**

Noise profile controls for Sinter

**0x31328**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x000000803	Reserved
15:8	R/W		global offset. A global offset that will be added to each of the hlog... values above
7:3	R/W		Reserved
2	R/W		Black Reflect. Specifies how to deal with data below black level. 0: Clip to zero, 1: Reflect.
1	R/W		use exp mask. 1 = use exposure mask provided by Frame stitching or threshold
0	R/W		Use LUT. 1 = use LUT data 0 = use exposure mask provided by Frame stitching or threshold

**0x3132C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	Black Level. Black level offset for Mode 0

**0x31330**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W		Reserved
15:0	R/W	0x00004000	Thresh1. Exposure thresholds. Used to determine which exposure generated the current pixel. Pixels with a value greater than or equal to a given threshold will be deemed to have been generated by the shorter exposure. Pixels with a value less than a given threshold will be deemed to have been generated by the longer exposure. E.G. Where 4 exposures are used: $VS \geq Thresh\ 3 > S \geq Thresh\ 2 > M \geq Thresh\ 1 > L$ For 3 exposures set Thresh 1 to 0 For 2 exposures set Thresh 1 and Thresh 2 to 0 For 1 exposures set all exposure thresholds to 0

**0x31334**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00008000	Reserved
15:0	R/W		Thresh2. See above.

**0x31338**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x0000C000	Reserved
15:0	R/W		Thresh3. See above.

**0x3133C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	noise level 3. Noise level of L exposure
23:16	R/W	0	noise level 2. Noise level of M exposure
15:8	R/W	0	noise level 1. Noise level of S exposure
7:0	R/W	0	noise level 0. Noise level of VS exposure

**sinter Noise Profile LUT**

This is an array of 128 8-bit registers. The address for element (i) is:  $0x313F8 + 4 * \text{int}(i / 4)$ .

<b>Address</b>	<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0x313F8	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x313FC	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x31474	31:24	R/W	-	Weight lut(127). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

**sinter shading**

This is an array of 33 8-bit registers. The address for element (i) is:  $0x329B8 + 4 * \text{int}(i / 4)$ .

Address	Bit(s)	R/W	Default	Description
0x329B8	31:24	R/W	-	rm shading lut(3). Radial Sinter LUT.
	23:16	R/W	-	rm shading lut(2). Radial Sinter LUT.
	15:8	R/W	-	rm shading lut(1). Radial Sinter LUT.
	7:0	R/W	-	rm shading lut(0). Radial Sinter LUT.
0x329BC	31:24	R/W	-	rm shading lut(7). Radial Sinter LUT.
	23:16	R/W	-	rm shading lut(6). Radial Sinter LUT.
	15:8	R/W	-	rm shading lut(5). Radial Sinter LUT.
	7:0	R/W	-	rm shading lut(4). Radial Sinter LUT.
... repeated until ...				
0x329D4	31:24	R/W	-	rm shading lut(31). Radial Sinter LUT.
	23:16	R/W	-	rm shading lut(30). Radial Sinter LUT.
	15:8	R/W	-	rm shading lut(29). Radial Sinter LUT.
	7:0	R/W	-	rm shading lut(28). Radial Sinter LUT.
0x329D8	31:8	R/W	-	Reserved
	7:0	R/W	-	rm shading lut(32)

## temper

Temporal noise reduction

### 0x329DC

Bit(s)	R/W	Default	Description
31:2	R/W	0	Reserved
1	R/W	0	Temper2 Mode. 0: 0=Temper3 mode 1=Temper2 mode
0	R/W	0	Enable. Temper enable: 0=off 1=on

**0x329E4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x000000202	Reserved
15:8	R/W		Delta
7:4	R/W		Reserved
3:0	R/W		Recursion Limit. Controls length of filter history. Low values result in longer history and stronger temporal filtering.

**temper Noise Profile**

Noise profile controls for Temper

**0x329E8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x000000803	Reserved
15:8	R/W		global offset. A global offset that will be added to each of the hlog... values above.
7:3	R/W		Reserved
2	R/W		Black Reflect. Specifies how to deal with data below black level. 0: Clip to zero, 1: Reflect.
1	R/W		use exp mask. 1 = use exposure mask provided by Frame stitching or threshold
0	R/W		Use LUT. 1 = use LUT data 0 = use exposure mask provided by Frame stitching or threshold

**0x329EC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	Black Level. Black level offset for Mode 0

7:0	R/W	0	noise level 0. Noise level of VS exposure

**temper Noise Profile LUT**

This is an array of 128 8-bit registers. The address for element (i) is: 0x32AB8 + 4 \* int(i / 4).

Address	Bit(s)	R/W	Default	Description
0x32AB8	31:24	R/W	-	Weight lut(3). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(2). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(1). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(0). Noise profile LUT. Calculated during calibration process.
0x32ABC	31:24	R/W	-	Weight lut(7). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(6). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(5). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(4). Noise profile LUT. Calculated during calibration process.
... repeated until ...				
0x32B34	31:24	R/W	-	Weight lut(127). Noise profile LUT. Calculated during calibration process.
	23:16	R/W	-	Weight lut(126). Noise profile LUT. Calculated during calibration process.
	15:8	R/W	-	Weight lut(125). Noise profile LUT. Calculated during calibration process.
	7:0	R/W	-	Weight lut(124). Noise profile LUT. Calculated during calibration process.

**temper dma****0x32B38**

Bit(s)	R/W	Default	Description
31:11	R/W	0x0000000F	Reserved
10	R/W		temper dw. 0: 16bit valid data 1: upto 12 bit valid data, MSB aligened to 16 bit
9:4	R/W		Reserved
3	R/W		Frame read on LSB dma. This must be set to 1 whenever Temper (either T2 or T3 mode) is enabled
2	R/W		Frame read on MSB dma. This must be set to 1 only in Temper-3 mode
1	R/W		Frame write on LSB dma. This must be set to 1 whenever Temper (either T2 or T3 mode) is enabled
0	R/W		Frame write on MSB dma. This must be set to 1 only in Temper-3 mode

**0x32B3C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x00000014	Reserved
7:0	R/W		Format. 20: for 16bit data both in T3 and T2 modes 6 : for 12bit data both in T3 and T2 modes

**0x32B40**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RO	-	<p>blk status. The bits are defined as follows:</p> <ul style="list-style-type: none"> <li>0 Write FIFO Fail (Full)</li> <li>1 Write FIFO Fail (Empty)</li> <li>2 Read FIFO Fail (Full)</li> <li>3 Read FIFO Fail (Empty)</li> <li>4 Pack Fail (Overflow)</li> <li>5 Unpack Fail (Overflow)</li> <li>6 Writer fail (Active Width)</li> <li>7 Writer fail (Active Height)</li> <li>8 Writer fail (Interline blanking)</li> <li>9 Writer fail (Interframe blanking)</li> <li>10 Reader fail (Active Width)</li> <li>11 Reader fail (Active Height)</li> <li>12 Reader fail (Interline blanking)</li> <li>13 Reader fail (Interframe blanking)</li> <li>14 0</li> <li>15 0</li> <li>16 Writer fail (A resp)</li> <li>17 Writer fail (AW wait)</li> <li>18 Writer fail (W wait)</li> <li>19 Writer fail (Outstanding Transactions)</li> <li>20 Reader fail (AR wait)</li> <li>21 Reader fail (R resp)</li> <li>22 Reader fail (Outstanding Transfers)</li> <li>23 0</li> <li>24 intw_fail_user_intfSig</li> <li>25 intr_fail_user_intfSig</li> <li>26 0</li> <li>27 0</li> <li>28 0</li> <li>29 0</li> </ul>

Bit(s)	R/W	Default	Description
			30 0
			31 0

**0x32B44**

Bit(s)	R/W	Default	Description
31:0	R/W	0	msb bank base writer. base address for frame buffer, should be word-aligned. This is used only in 16bit temper3 mode. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The MSB part is stored into this buffer

**0x32B48**

Bit(s)	R/W	Default	Description
31:0	R/W	0	lsb bank base writer. base address for frame buffer, should be word-aligned. This is used all the times temper is used.. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The LSB part is stored into this buffer.

**0x32B4C**

Bit(s)	R/W	Default	Description
31:0	R/W	0	msb bank base reader. base address for frame buffer, should be word-aligned. This is used only in 16bit temper3 mode. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The MSB part is stored into this buffer

**0x32B50**

Bit(s)	R/W	Default	Description
31:0	R/W	0	lsb bank base reader. base address for frame buffer, should be word-aligned. This is used all the times temper is used.. In 16bit temper3 mode, each 40 bit temper data (32bit data+8bit meta data) is split into 2 chunks and each is stored in one of the buffers. The LSB part is stored into this buffer.

**0x32B54**

Bit(s)	R/W	Default	Description
31:0	R/W	0x00001000	Line offset. Indicates the offset in bytes from the start of one line to the next line. This value should be equal to or larger than one line of image data and should be word-aligned

**0x32B58**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R/W	0x00000002	Reserved
1	R/W		linetick eol. linetick start/end of line control. 0 = use start of line, 1 = use end of line
0	R/W		Reserved

**0x32B60**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00000040	linetick repeat. line number of first linetick. 0 = no repeat
15:0	R/W		linetick first. line number of first linetick. 0 = no linetick

**0x32B68**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/W	0x0F007E00	Reserved
8	R/W		writer axi id multi. 0= static value (axi_id_value) for awid/wid, 1 = incrementing value per transaction for awid/wid wrapping to 0 after axi_id_value
7:4	R/W		lsb writer axi id value. value to send for awid, wid and expected on bid.
3:0	R/W		msb writer axi id value. value to send for awid, wid and expected on bid.

**0x32B6C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x0F007E00	Reserved
7:4	R/W		lsb reader axi id value. value to send for awid, wid and expected on bid. Good default = "0000"
3:0	R/W		msb reader axi id value. value to send for awid, wid and expected on bid. Good default = "0000"

**ca correction**

Ca Correction

**0x32B70**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:6	R/W	0	Reserved
5:4	R/W	0	Mesh Scale. extra shift of mesh data: 00- no shift, 01- shift left by 1, ..., 11- shift left by 3, used to increase the range at cost of accuracy
3:1	R/W	0	Reserved
0	R/W	0	Enable. module enable, if 0 the data_i(dw*(kh-1)/2+dw-1 downto dw*(kh-1)/2) is presented at data_o after pipeline length

**0x32B74**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:23	R/W	0x00400040	Reserved
22:16	R/W		Mesh Height. number of tiles vertically. Maximum supported mesh height is 64 for RGGB sensor and 42 for RGBIr sensors.
15:7	R/W		Reserved
6:0	R/W		Mesh Width. number of tiles across. Maximum supported mesh width is 64.

**0x32B78**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29	R/W	0x00400040	Reserved
28:16	R/W		Plane Offset. offset between colour planes, can differ from line_offset*mesh_height
15:13	R/W		Reserved
12:0	R/W		Line Offset. offset between lines of tiles, can differ from mesh_width, but its safe to keep same as mesh width

**square be**

sensor offset for the square module

**0x32B80**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	black level in. input Data black level

**0x32B84**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	black level out. output Data black level

**sensor offset pre shading**

offset offset subtraction for each color channel and exposure

**0x32B88**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 00. offset offset for color channel 00 (R)

**0x32B8C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 01. offset offset for color channel 01 (Gr)

**0x32B90**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 10. offset offset for color channel 10 (Gb)

**0x32B94**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	offset 11. offset offset for color channel 11 (B)

**radial shading**

Radial Lens shading correction

**0x32B98**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0	Reserved
0	R/W	0	Enable. Lens shading correction enable: 0=off, 1=on

**0x32B9C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerR y. Center y coordinate of the red shading map
15:0	R/W		centerR x. Center x coordinate of the red shading map

**0x32BA0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerG y. Center y coordinate of the green shading map
15:0	R/W		centerG x. Center x coordinate of the green shading map

**0x32BA4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerB y. Center y coordinate of the blue shading map
15:0	R/W		centerB x. Center x coordinate of the blue shading map

**0x32BA8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x021C03C0	centerlr y. Center y coordinate of the IR shading map
15:0	R/W		centerlr x. Center x coordinate of the IR shading map

**0x32BAC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multRy. Normalizing Y factor which scales the Red radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.
15:0	R/W		off center multRx. Normalizing X factor which scales the Red radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x32BB0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multGy. Normalizing Y factor which scales the green radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.
15:0	R/W		off center multGx. Normalizing X factor which scales the green radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x32BB4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multBy. Normalizing Y factor which scales the blue radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.
15:0	R/W		off center multBx. Normalizing X factor which scales the blue radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**0x32BB8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06EA06EA	off center multiRy. Normalizing Y factor which scales the Ir radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.
15:0	R/W		off center multiRx. Normalizing X factor which scales the Ir radial table to the edge of the image. Calculated as $2^{31}/R^2$ where R is the furthest distance from the center coordinate to the edge of the image in pixels.

**mesh shading**

Mesh Lens shading correction

**0x32BBC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0x3F3FE406	Reserved
29:24	R/W		Mesh height. Number of vertical nodes minus 1

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:22	R/W		Reserved
21:16	R/W		Mesh width. Number of horizontal nodes minus 1
15:14	R/W		Mesh page Ir. Selects memory page for IR pixels correction.
13:12	R/W		Mesh page B. Selects memory page for blue pixels correction.
11:10	R/W		Mesh page G. Selects memory page for green pixels correction.
9:8	R/W		Mesh page R. Selects memory page for red pixels correction.
7	R/W		Reserved
6:5	R/W		Mesh alpha mode. Sets alpha blending between mesh shading tables. 0 = no alpha blending; 1=2 banks (odd/even bytes) 2=4 banks (one per 8 bit lane in each dword)
4:2	R/W		Mesh scale. Selects the precision and maximal gain range of mesh shading correction Gain range: 00- 0..2; 01- 0..4; 02- 0..8; 03- 0..16; 04- 1..2; 05- 1..3; 06- 1..5; 07- 1..9(float)
1	R/W		Mesh show. Lens shading correction debug: 0=off, 1=on (show mesh data)
0	R/W		Enable. Lens shading correction enable: 0=off, 1=on

**0x32BC4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11:9	R/W	0	Mesh alpha bank Ir. Bank selection for Ir blend: 0: 0+1; 1: 1+2; 2: 2:3; 3: 3+0; 4:0+2; 5: 1+3; 6,7: reserved
8:6	R/W	0	Mesh alpha bank B. Bank selection for B blend: 0: 0+1; 1: 1+2; 2: 2:3; 3: 3+0; 4:0+2; 5: 1+3; 6,7: reserved
5:3	R/W	0	Mesh alpha bank G. Bank selection for G blend: 0: 0+1; 1: 1+2; 2: 2:3; 3: 3+0; 4:0+2; 5: 1+3; 6,7: reserved
2:0	R/W	0	Mesh alpha bank R. Bank selection for R blend: 0: 0+1; 1: 1+2; 2: 2:3; 3: 3+0; 4:0+2; 5: 1+3; 6,7: reserved

**0x32BC8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	Mesh alpha Ir. Alpha blend coeff for IR
23:16	R/W	0	Mesh alpha B. Alpha blend coeff for B
15:8	R/W	0	Mesh alpha G. Alpha blend coeff for G
7:0	R/W	0	Mesh alpha R. Alpha blend coeff for R

**0x32BCC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00001000	Reserved
15:0	R/W		Mesh strength. Mesh strength in 4.12 format, e.g. 0 - no correction, 4096 - correction to match mesh data. Can be used to reduce shading correction based on AE.

**white balance**

Static white balance - independent gain for each color channel

**0x32BD0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01000100	Reserved
27:16	R/W		Gain 01. Multiplier for color channel 01 (Gr) Format: unsigned 4.8-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		Gain 00. Multiplier for color channel 00 (R) Format: unsigned 4.8-bit fixed-point

**0x32BD4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x01000100	Reserved
27:16	R/W		Gain11. Multiplier for color channel 11 (B) Format: unsigned 4.8-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		Gain 10. Multiplier for color channel 10 (Gb) Format: unsigned 4.8-bit fixed-point

**white balance aexp****0x32BD8**

Bit(s)	R/W	Default	Description
31:28	R/W	0x01000100	Reserved
27:16	R/W		Gain 01. Multiplier for color channel 01 (Gr) Format: unsigned 4.8-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		Gain 00. Multiplier for color channel 00 (R) Format: unsigned 4.8-bit fixed-point

**0x32BDC**

Bit(s)	R/W	Default	Description
31:28	R/W	0x01000100	Reserved
27:16	R/W		Gain 11. Multiplier for color channel 11 (B) Format: unsigned 4.8-bit fixed-point
15:12	R/W		Reserved
11:0	R/W		Gain 10. Multiplier for color channel 10 (Gb) Format: unsigned 4.8-bit fixed-point

**iridix gain**

Digital gain for RAW sensor data

**0x32BE0**

Bit(s)	R/W	Default	Description
31:12	R/W	0x00000100	Reserved
11:0	R/W		Gain. Gain applied to data in 4.8 format

**0x32BE4**

Bit(s)	R/W	Default	Description
31:20	R/W	0	Reserved
19:0	R/W	0	Offset. Data black level

**iridix**

Iridix is an adaptive, space-variant tone mapping engine.

It is used to maintain or enhance shadow detail while preserving highlights.

**0x32BE8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00004629	Reserved
15:14	R/W		stat mult
13:7	R/W		Reserved
6	R/W		postgamma pos. PosGamma application 0=gain 1=data
5	R/W		black level amp0. 1=Ignore Black level (set to zero) in amplifier. 0=Use Black level value.
4	R/W		Reserved
3	R/W		max alg type. Max Bayer Algorithm Type.
2:1	R/W		Reserved
0	R/W		iridix on. Iridix enable: 0=off 1=on

**0x32BEC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00408012	Reserved
23:16	R/W		slope min. Restricts the minimum slope (gain) which can be generated by the adaptive algorithm
15:8	R/W		slope max. Restricts the maximum slope (gain) which can be generated by the adaptive algorithm
7:4	R/W		variance intensity. Sets the degree of luminance sensitivity of the algorithm(Irdx7F)
3:0	R/W		variance space. Sets the degree of spatial sensitivity of the algorithm(Irdx7F)

**0x32BF0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	black level. Iridix black level. Values below this will not be affected by Iridix.

**0x32BF4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0x0000FFFF	Reserved
19:0	R/W		white level. Iridix white level. Values above this will not be affected by Iridix.

**0x32BF8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0x00000100	Reserved
11:0	R/W		collection correction

**0x32BFC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26	R/W	0x02000101	Reserved
25:16	R/W		strength inroi. Manual Strength value for inside of ROI
15:10	R/W		Reserved
9:8	R/W		rev percept control. Iridix gamma processing select: 0=pass through 1=gamma_dl 2=sqrt 3=gamma_lut.
7:2	R/W		Reserved
1:0	R/W		fwd percept control. Iridix gamma processing select: 0=pass through 1=gamma_dl 2=sqrt 3=gamma_lut.

**0x32C00**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x00000200	Reserved
9:0	R/W		strength outroi. Manual Strength value for outside of ROI

**0x32C04**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0xFFFF0000	roi hor end. Horizontal ending point of ROI
15:0	R/W		roi hor start. Horizontal starting point of ROI

**0x32C08**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0xFFFF0000	roi ver end. Vertical ending point of ROI
15:0	R/W		roi ver start. Vertical starting point of ROI

**0x32C0C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0xB0A00001	Contrast. Iridix8 contrast control parameter
23:16	R/W		bright pr. Manual Bright_Preserve value to control Iridix core
15:12	R/W		Reserved
11:8	R/W		Svariance. Iridix8 transform sensitivity to different areas of image
7:1	R/W		Reserved
0	R/W		filter mux. Selects between Iridix8 and Iridix7, 1=Iridix8 and 0=Iridix7

**0x32C10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x00001000	Reserved
15:0	R/W		dark enh. Manual Dark_Enhance value to control Iridix core

**0x32C14**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:18	R/W	0x00000100	Reserved
17:0	R/W		fwd alpha. alpha for gamma_dl

**0x32C18**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:18	R/W	0x00001000	Reserved
17:0	R/W		rev alpha. alpha for gamma_dl

**0x32C1C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R/W	0	Reserved
1:0	R/W	0	context no. Context id of a input Frame

**0x32C20**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R/W	0	Reserved
19:0	R/W	0	wb offset. White balance offset

**0x32C24**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

Bayer Demosaic

**0x32E3C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0xADAAC0C0	UU Slope. Slope of undefined blending threshold in 4.4 logarithmic format
23:16	R/W		VA Slope. Slope of VH-AA blending threshold in 4.4 log format. High values will tend to favor one direction over the other (depending on VA Thresh) while lower values will give smoother blending.
15:8	R/W		AA Slope. Slope of angular (45/135) blending threshold in 4.4 format. High values will tend to favor one direction over the other (depending on AA Thresh) while lower values will give smoother blending.
7:0	R/W		VH Slope. Slope of vertical/horizontal blending threshold in 4.4 logarithmic format. High values will tend to favor one direction over the other (depending on VH Thresh) while lower values will give smoother blending.

**0x32E40**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R/W	0x0000005D	Reserved
7:0	R/W		Sat Slope. Slope of saturation blending threshold in linear format 2.6

**0x32E44**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00A00131	Reserved
27:16	R/W		AA Thresh. Threshold for the range of angular (45/135) blending. The threshold defines the difference of 45 and 135 gradients at which the 45 gradient will start to be taken into account in the blending (if AA Offset is set to 0). Setting the offset not null (or the slope low) will include proportion of the 45 gradient in the blending before even the gradient difference reaches the threshold (see AA Offset for more details).
15:12	R/W		Reserved
11:0	R/W		VH Thresh. Threshold for the range of vertical/horizontal blending The threshold defines the difference of vertical and horizontal gradients at which the vertical gradient will start to be taken into account in the blending (if VH Offset is set to 0). Setting the offset not null (or the slope low) will include proportion of the vertical gradient in the blending before even the gradient difference reaches the threshold (see VH Offset for more details).

**0x32E48**

31:12	R/W	0x00000100	Reserved
11:0	R/W		gain_b [11:0].gain applied to the B channel in 4.8 format

**0x341A4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x00000000	Reserved
27:16	R/W		offset_g [11:0]. Offset subtracted from the G channel
15:12	R/W		Reserved
11:0	R/W		offset_r [11:0]. Offset subtracted from the R channel

**0x341A8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0x00000000	Reserved
11:0	R/W		offset_b [11:0]. Offset subtracted from the B channel

**ds sharpen****0x341AC**

Sharpen.

Luma transform red coefficient. u0.8.

Luma transform blue coefficient. u0.8.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0x00000000	Reserved
0	R/W		Enable. Sharpening enable: 0=off, 1=on

**0x341B0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/W	0x00000010	Reserved
8:0	R/W		Strength [8:0]. Controls strength of sharpening effect. u5.4

**0x341B4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00131E4C	Reserved
23:16	R/W		Alpha Undershoot [7:0]. Alpha blending of undershoot and overshoot u0.7, 0 = only unsershoot, 255 = only overshoot
15:8	R/W		Control B
7:0	R/W		Control R

**0x341B4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00131E4C	Reserved
23:16	R/W		Alpha Undershoot [7:0]. Alpha blending of undershoot and overshoot u0.7, 0 = only unsershoot, 255 = only overshoot
15:8	R/W		Control B
7:0	R/W		Control R

**0x341B8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	Reserved
23:16	R/W		Luma Offset Low [7:0].Luma offset (min value) of thre region of less than Luma Thresh Low.
15:10	R/W		Reserved
9:0	R/W		Luma Thresh Low [9:0].Luma threshold below this value, no sharpening will be applied.

**0x341BC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26	R/W	0x033203FC	Reserved
25:16	R/W		Luma Thresh High [9:0]. Luma threshold above this value, sharpening level will be decreased.
15:0	R/W		Luma Slope Low [15:0]. Luma linear threshold slope at dark luminance region

**0x341C0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x06A40000	Luma Slope High [15:0] Luma linear threshold slope at bright luminance region
15:8	R/W		Reserved
7:0	R/W		Luma Offset High [7:0]. Luma offset (min value) of thre region of more than Luma Thresh High.

**0x341C4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0x00CD3FFF	Reserved
29:16	R/W		Clip Str Min [13:0], clips sharpening mask of min value. This will control undershoot. U0.14. It is used as negative value. (0 ~ -16383)
15:14	R/W		Reserved
13:0	R/W		Clip Str Max [13:0], clips sharpening mask of max value. This will control overshoot. U0.14. (0 ~ 16383)

**0x341C8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0x00000000	Reserved
3:0	R/W		Debug [3:0].To support different debug output. 0 = normal operation, 1 = luma, 2 = sharpening mask

**ds cs conv****0x341CC**

Conversion of RGB to YUV data using a 3x3 color matrix plus offsets

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0	Reserved
3	R/W	0	Enable vertical downsample, Vertical Downsampling Enable: 0=off 1=on
2	R/W	0	Enable horizontal downsample, Horizontal Downsampling Enable: 0=off 1=on
1	R/W	0	Enable filter. Filter enable: 0=off 1=on
0	R/W	0	Enable matrix. Color matrix enable: 0=off 1=on

**0x341D0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x0000002F	Reserved
15:0	R/W		Coefft 11. Matrix coefficient for R-Y multiplier. Format: sign/magnitude 8.8-bit fixed-point

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:11	R/W	0x00000000	Reserved
10:0	R/W		Coefft o1 [10:0]. Offset for Y Format: signed (2's complement) 11-bit integer

**0x341F8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:11	R/W	0x00000200	Reserved
10:0	R/W		Coefft o2 [10:0]. Offset for Cb Format: signed (2's complement) 11-bit integer

**0x341FC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:11	R/W	0x00000200	Reserved
10:0	R/W		Coefft o3 [10:0]. Offset for Cr Format: signed (2's complement) 11-bit integer

**0x34200**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x00000000	Reserved
9:0	R/W		Clip min Y [9:0]. Minimal value for Y. Values below this are clipped. Format: signed (2's complement) 10-bit integer

**0x34204**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x000003FF	Reserved
9:0	R/W		Clip max Y [9:0]. Maximal value for Y. Values above this are clipped. Format: signed (2's complement) 10-bit integer

**0x34208**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x00000000	Reserved
9:0	R/W		Clip min UV [9:0]. Minimal value for Cb, Cr. Values below this are clipped. Format: signed (2's complement) 10-bit integer

**0x3420C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x00000000	Reserved
9:0	R/W		Clip max UV [9:0]. Maximal value for Cb, Cr. Values above this are clipped. Format: signed (2's complement) 10-bit integer

**0x34210**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x000003FF	Reserved
9:0	R/W		Data mask RY [9:0]. Data mask for channel 1 (R or Y). Bit-wise and of this value and video data.

**0x34214**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x000003FF	Reserved
9:0	R/W		Data mask GU [9:0]. Data mask for channel 2 (G or U). Bit-wise and of this value and video data

**0x34218**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:10	R/W	0x000003FF	Reserved
9:0	R/W		Data mask BV [9:0]. Data mask for channel 3 (B or V). Bit-wise and of this value and video data.

**ds cs conv dither****0x3421C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:5	R/W	0	Reserved
4	R/W	0	Shift mode, 0= output is LSB aligned; 1=output is MSB aligned
3	R/W	0	Reserved
2:1	R/W	0	Dither amount, 0= dither to 9 bits; 1=dither to 8 bits; 2=dither to 7 bits; 3=dither to 6 bits
0	R/W	0	Enable dither, enables dithering module

**ds dma writer****DMA writer controls 0x34220**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11	R/W	0	axi xact comp, 0 = dont wait for axi transaction completion at end of frame(just all transfers accepted). 1= wait for all transactions completed
10	R/W	0	Reserved
9	R/W	0	frame write on, 0 = no frames written(when switched from 1, current frame completes writing before stopping),1= write frame(s) (write single or continous frame(s) )
8	R/W	0	Reserved
7:6	R/W	0	Plane select, Plane select for planar base modes. Only used if planar outputs required. Not used. Should be set to 0
5	R/W	0	Reserved
4:0	R/W	0	Base mode, Base DMA packing mode for RGB/Raw/YUV etc

**0x34224**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x04380780	active height, Active video height in lines 128-8000
15:0	R/W		active width, Active video width in pixels 128-8000

**0x34228**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank 0 base address for frame buffer, should be word-aligned

**0x3422C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R/W	0	Reserved
2:0	R/W	0	Max bank, highest bank*_base to use for frame writes before recycling to bank0_base, only 0 to 4 are valid

**0x34240**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0x00001000	Line offset: Indicates the offset in bytes from the start of one line to the next line. This value should be equal to or larger than one line of image data and should be word-aligned

**0x34244**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	-	Reserved
3:1	R/O	-	wbank curr, write bank currently active. valid values =0-4. updated at start of frame write
0	R/O	-	wbank active, 1 = wbank_curr is being written to. Goes high at start of writes, low at last write transfer/completion on axi.

**0x34250**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/O	-	frame wcount, count of outgoing frame writes (starts) from vdma_writer sent to AXI output, non resetable, rolls over, updates at pixel 1 of new frame on video in
15:0	R/O		frame icount , count of incomming frames (starts) to vdma_writer on video input, non resetable, rolls over, updates at pixel 1 of new frame on video in

**0x34258**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/O	-	Reserved
8	R/O		video alarm, active high, problem found on video port(s) ( active width/height or interline/frame blanks failure)
7	R/O		vi fail interframe blanks, clearable alarm, high to indicate interframe blanking below min
6	R/O		vi fail interline blanks, clearable alarm, high to indicate interline blanking below min
5	R/O		vi fail active height, clearable alarm, high to indicate mismatched active_height detected ( also raised on missing field!)
4	R/O		vi fail active width, clearable alarm, high to indicate mismatched active_width detected
3	R/O		axi fail wxact_ostand, clearable alarm, high when wxact_ostand_limit reached
2	R/O		axi fail wmaxwait, clearable alarm, high when wmaxwait_limit reached
1	R/O		axi fail awmaxwait, clearable alarm, high when awmaxwait_limit reached
0	R/O		axi fail bresp, clearable alarm, high to indicate bad bresp captured

**0x3425C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/O	-	blk status, block status output (reserved) - blk_status(0) = wfifo_fail_full - blk_status(1) = wfifo_fail_empty - blk_status(4) = pack_fail_overflow - blk_status(24) = intw_fail_user_intfc_sig - blk_status(others) = zero

**0x34260**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	lines wrapped, number of lines to write from base address before wrapping back to base address. 0 = no wrapping, >0 = last line written before wrapping

**0x34264**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick first, line number of first linetick. 0 = no linetick, >0 = line number to generate linetick

**0x34268**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick repeat, line repeat interval of linetick. 0 = no repeat, >0 = repeat interval in lines

**0x3426C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	linetick delay, Linetick delay in vcke cycles to add to min 3 cycle latency from acl_vi. 0-65535. Must be less than next linetick generation time or count will not mature and no linetick is not produced. -NOTE: linetick delay can run past end of frame/field and also into next frame! - Take care maturity time is less than next configured linetick generation position! - Take care when changing config between frame too!
15:1	R/W	0	Reserved
0	R/W	0	linetick eol, Linetick start/end of line control. 0 = use start of line, 1 = use end of line to generate linetick

**0x34270**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R/W	0	Reserved
1	R/W	0	axi_id_multi, 0= static value (axi_id_value) for awid/wid, 1 = incrementing value per transaction for awid/wid wrapping to 0 after axi_id_value
0	R/W	0	Reserved

**0x34274**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0	Reserved
3:0	R/W	0	axi id value, value to send for awid, wid and expected on bid. Good default = 0000

**ds uv dma writer****DMA writer controls 0x34278**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:12	R/W	0	Reserved
11	R/W	0	axi xact comp, 0 = dont wait for axi transaction completion at end of frame(just all transfers accepted). 1= wait for all transactions completed
10	R/W	0	Reserved
9	R/W	0	frame write on, 0 = no frames written(when switched from 1, current frame completes writing before stopping),1= write frame(s) (write single or continuous frame(s) )
8	R/W	0	Reserved
7:6	R/W	0	Plane select, Plane select for planar base modes. Only used if planar outputs required. Not used. Should be set to 0
5	R/W	0	Reserved
4:0	R/W	0	Base mode, Base DMA packing mode for RGB/RAW/YUV etc

**0x3427C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0x04380780	active height, Active video height in lines 128-8000
15:0	R/W		active width, Active video width in pixels 128-8000

**0x34280**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank 1 base address for frame buffer, should be word-aligned

**0x34288**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank 2 base address for frame buffer, should be word-aligned

**0x3428C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank 3 base address for frame buffer, should be word-aligned

**0x34290**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	bank 4 base address for frame buffer, should be word-aligned

**0x34294**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:3	R/W	0	Reserved
2:0	R/W	0	Max bank, highest bank*_base to use for frame writes before recycling to bank0_base, only 0 to 4 are valid

**0x34298**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0x00001000	Line offset: Indicates the offset in bytes from the start of one line to the next line. This value should be equal to or larger than one line of image data and should be word-aligned

**0x3429C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	-	Reserved
3:1	R/O	-	wbank curr, write bank currently active, valid values =0-4. updated at start of frame write
0	R/O	-	wbank active, 1 = wbank_curr is being written to. Goes high at start of writes, low at last write transfer/completion on axi.

**0x342A8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/O	-	frame wcount, count of outgoing frame writes (starts) from vdma_writer sent to AXI output, non resetable, rolls over, updates at pixel 1 of new frame on video in
15:0	R/O		frame icount , count of incoming frames (starts) to vdma_writer on video input, non resetable, rolls over, updates at pixel 1 of new frame on video in

**0x342B0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:9	R/O	-	Reserved
8	R/O		video alarm, active high, problem found on video port(s) ( active width/height or interline/frame blanks failure)
7	R/O		vi fail interframe blanks, clearable alarm, high to indicate interframe blanking below min
6	R/O		vi fail interline blanks, clearable alarm, high to indicate interline blanking below min
5	R/O		vi fail active height, clearable alarm, high to indicate mismatched active_height detected ( also raised on missing field!)
4	R/O		vi fail active width, clearable alarm, high to indicate mismatched active_width detected
3	R/O		axi fail wxact_ostand, clearable alarm, high when wxact_ostand_limit reached
2	R/O		axi fail wmaxwait, clearable alarm, high when wmaxwait_limit reached
1	R/O		axi fail awmaxwait, clearable alarm, high when awmaxwait_limit reached
0	R/O		axi fail bresp, clearable alarm, high to indicate bad bresp captured

**0x342B4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/O	-	blk status, block status output (reserved) - blk_status(0) = wfifo_fail_full - blk_status(1) = wfifo_fail_empty - blk_status(4) = pack_fail_overflow - blk_status(24) = intw_fail_user_intfc_sig - blk_status(others) = zero

**0x342B8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	lines wrapped, number of lines to write from base address before wrapping back to base address. 0 = no wrapping, >0 = last line written before wrapping

**0x342BC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick first, line number of first linetick. 0 = no linetick, >0 = line number to generate linetick

**0x342C0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	Reserved
15:0	R/W	0	linetick repeat, line repeat interval of linetick. 0 = no repeat, >0 = repeat interval in lines

**0x342C4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	<p>linetick delay, Linetick delay in vcke cycles to add to min 3 cycle latency from acl_vi. 0-65535.</p> <p>Must be less than next linetick generation time or count will not mature and no linetick is not produced.</p> <p>-NOTE: linetick delay can run past end of frame/field and also into next frame!</p> <ul style="list-style-type: none"> <li>- Take care maturity time is less than next configured linetick generation position!</li> <li>- Take care when changing config between frame too!</li> </ul>
15:1	R/W	0	Reserved
0	R/W	0	linetick eol, Linetick start/end of line control. 0 = use start of line, 1 = use end of line to generate linetick

**0x342C8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R/W	0	Reserved
1	R/W	0	axi_id_multi, 0= static value (axi_id_value) for awid/wid, 1 = incrementing value per transaction for awid/wid wrapping to 0 after axi_id_value
0	R/W	0	

**0x342CC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4	R/W	0	Reserved
3:0	R/W	0	axi id value, value to send for awid, wid and expected on bid. Good default = 0000

**multi ctx****0x342D0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R/W	0	Reserved
0	R/W	0	<p>Configure Done. This signal is only required in multi-context mode</p> <p>Once configuration for ping/pong address space is done, MCU must write 1 into this address</p> <p>This register is self-clearing. So the read-back will be 0</p>

### 10.1.2.3 Demux Registers

Demux Common Register

Final address = 0xFFD06000+ offset \* 4

#### STB\_TOP\_CONFIG 0xf0

Bit(s)	R/W	Default	Description
30:28	RW	0	ciplus_o_sel
27:26	RW	0	ciplus_i_sel
25	RW	0	use FAIL from TS2
24	RW	0	use FAIL from TS1
23	RW	0	use FAIL from TS0
22	RW	0	invert fec_error for S2P1
21	RW	0	invert fec_data for S2P1
20	RW	0	invert fec_sync for S2P1
19	RW	0	invert fec_valid for S2P1
18	RW	0	invert fec_clk for S2P1
17:16	RW	0	fec_s_sel for S2P1 00 - select TS0, 01 -- select TS1, 10 -- select TS2, 11 - reserved
15	RW	0	enable_des_pl_clk
14:13	RW	0	reserved
12:10	RW	0	ts_out_select, 0-TS0, 1-TS1, 2-TS2, 3,4-Reserved, 5-S2P1, 6-S2P0, 7-File
9:8	RW	0	des_i_sel 00 -- select_fec_0, 01 -- select_fec_1, 10 -- select_fec_2, 11 - reserved
7	RW	0	enable_des_pl
6	RW	0	invert fec_error for S2P0
5	RW	0	invert fec_data for S2P0
4	RW	0	invert fec_sync for S2P0
3	RW	0	invert fec_valid for S2P0
2	RW	0	invert fec_clk for S2P0
1:0	RW	0	fec_s_sel for S2P0 00 - select TS0, 01 -- select TS1, 10 -- select TS2, 11 - reserved

#### TS\_TOP\_CONFIG 0xf1

Bit(s)	R/W	Default	Description

31:28	RW	7	s2p1_clk_div
27:24	RW	7	s2p0_clk_div
23	RW	0	s2p1_disable
22	RW	0	s2p0_disable
21	RW	0	Reserved
20	RW	0	TS_OUT_error_INVERT
19	RW	0	TS_OUT_data_INVERT
18	RW	0	TS_OUT_sync_INVERT
17	RW	0	TS_OUT_valid_INVERT
16	RW	0	TS_OUT_clk_INVERT
15:8	RW	187	TS_package_length_sub_1 (default : 187)
7:0	RW	0x47	fec_sync_byte (default : 0x47)

**TS\_FILE\_CONFIG 0xf2**

Bit(s)	R/W	Default	Description
25:24	RW	3	transport_scrambling_control_odd_2 // should be 3
23:16	RW	0	file_m2ts_skip_bytes
15:8	RW	0	des_out_dly
7:6	RW	3	transport_scrambling_control_odd // should be 3
5	RW	0	ts_hiue_enable
4:0	RW	4	fec_clk_div

**TS\_PL\_PID\_INDEX 0xf3**

Bit(s)	R/W	Default	Description
19:14	R	0	des_2 ts pl state -- Read Only
13:8	R	0	des ts pl state -- Read Only
3:0	RW	0	PID index to 8 PID to get key-set auto increase after TS_PL_PID_DATA read/write

**TS\_PL\_PID\_DATA 0xf4**

Bit(s)	R/W	Default	Description
29	RW	0	PID #INDEX +1 match disable
28:16	RW	0	PID #INDEX+1

13	RW	0	PID #INDEX match disable
12:0	RW	0	PID #INDEX

**COMM\_DESC\_KEY0 0xf5**

Bit(s)	R/W	Default	Description
31:0	RW	0	Common descrambler key (key Bits[63:32])

**COMM\_DESC\_KEY1 0xf6**

Bit(s)	R/W	Default	Description
31:0	RW	0	Common descrambler key (key Bits[31:0])

**COMM\_DESC\_KEY\_RW 0xf7**

Bit(s)	R/W	Default	Description
7	RW	0	Key endian;
6	RW	0	Write key ladder cw [127:64] to key;
5	RW	0	Write key ladder cw [63:0] to key;
4	RW	0	0: write to descramble 1; 1: write to descramble 2;
3:0	RW	0	The address of key

**CIPPLUS\_KEY0 0xf8**

Bit(s)	R/W	Default	Description
31:0	RW	0	Ci+ Register defines Bits[31:0] of the key

**CIPPLUS\_KEY1 0xf9**

Bit(s)	R/W	Default	Description
31:0	RW	0	Ci+ Register defines Bits[63:32] of the key

**CIPPLUS\_KEY2 0xfa**

Bit(s)	R/W	Default	Description
31:0	RW	0	Ci+ Register defines Bits[95:64] of the key

**CIPPLUS\_KEY3 0xfb**

Bit(s)	R/W	Default	Description
31:0	RW	0	Ci+ Register defines Bits[127:96] of the key

**CIPPLUS\_KEY\_WR 0xfc**

Bit(s)	R/W	Default	Description
31:0	RW	0	

5	RW	0	write AES IV B value
4	RW	0	write AES IV A value
3	RW	0	write AES B key
2	RW	0	write AES A key
1	RW	0	write DES B key
0	RW	0	write DES A key

**CIPLUS\_CONFIG 0xfd**

Bit(s)	R/W	Default	Description
15:8	RW	0	TS out delay. This controls the rate at which the Ciplus module drives TS out
3	RW	0	General enable for the ciplus module
2	RW	0	AES CBC disable (default should be 0 to enable AES CBC)
1	RW	0	AES Enable
0	RW	0	DES Eanble

**CIPLUS\_ENDIAN 0xfe**

Bit(s)	R/W	Default	Description
31:28	RW	0	AES IV endian
27:24	RW	0	AES message out endian
23:20	RW	0	AES message in endian
19:16	RW	0	AES key endian
15:11	RW	0	unused
10:8	RW	0	DES message out endian
6:4	RW	0	DES message in endian
2:0	RW	0	DES key endian

**COMM\_DESC\_2\_CTL 0xff**

Bit(s)	R/W	Default	Description
15:8	RW	0	des_out_dly_2
7	RW	0	reserved
6	RW	0	enable_des_pl_clk_2
5	RW	0	enable_des_pl_2
4:2	RW	0	use_des_2 Bit[2] -- demux0, Bit[3] -- demux1, Bit[4] -- demux2

1:0	RW	0	des_i_sel_2 00 -- select_fec_0, 01 -- select_fec_1, 10 -- select_fec_2, 11 - reserved
-----	----	---	---

demux core register

demux core 0 Final address = 0xc1105800 + offset \* 4

demux core 1 Final address = 0xc1105940 + offset \* 4

demux core 2 Final address = 0xc1105a80 + offset \* 4

### STB\_VERSION\_O 0x00

Bit(s)	R/W	Default	Description
31:0	R	0x30003	The version of stb

### STB\_TEST\_REG\_O 0x01

Bit(s)	R/W	Default	Description
31:0	RW	0xfe015aa5	Test register.

### FEC\_INPUT\_CONTROL\_O 0x02

Bit(s)	R/W	Default	Description
15	RW	0	fec_core_select 1 - select descramble output
14:12	RW	0	fec_select 0-TS0, 1-TS1, 2-TS2, 3,4-Reserved, 5-S2P1, 6-S2P0, 7-File
11	RW	0	FEC_CLK
10	RW	0	SOP
9	RW	0	D_VALID
8	RW	0	D_FAIL
7:0	RW	0	D_DATA 7:0

### FEC\_INPUT\_DATA\_O 0x03

Bit(s)	R/W	Default	Description
11	R	0	FEC_CLK
20	R	0	SOP
9	R	0	VALID
8	R	0	FAIL
7:0	R	0	FEC DATAIN

### DEMUX\_CONTROL\_O 0x04

Bit(s)	R/W	Default	Description
31	RW	0	enable_free_clk_fec_data_valid

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30	RW	0	enable_free_clk_stb_reg
29	RW	0	always_use_pes_package_length
28	RW	0	disable_pre_incomplete_section_fix
27	RW	0	pointer_field_multi_pre_en
26	RW	0	ignore_pre_incomplete_section
25	RW	0	video2_enable
24:22	RW	0	video2_type
21	RW	0	do_not_trust_pes_package_length
20 (bit4)	RW	0	Bypass use recoder path
19 (bit3)	RW	0	clear_PID_continuity_counter_valid
18 (bit2)	RW	0	Disable Splicing
17 (bit1)	RW	0	Insert PES_STRONG_SYNC in Audio PES
16 (bit0)	RW	0	Insert PES_STRONG_SYNC in Video PES
15	RW	0	do not trust section length
14	RW	0	om cmd push even zero
13	RW	0	set_buff_ready_even_not_busy
12	RW	0	SUB, OTHER PES interrupt at beginning of PES
11	RW	0	discard_av_package -- for ts_recorder use only
10	RW	0	ts_recorder_select 0:after PID filter 1:before PID filter
9	RW	0	ts_recorder_enable
8	RW	0	(table_id == 0xff) means section_end
7	RW	0	do not send uncomplete section
6	RW	0	do not discard duplicate package
5	RW	0	search SOP when trasport_error_indicator
4	RW	0	stb demux enable
3	RW	0	do not reset state machine on SOP
2	RW	0	search SOP when error happened ( when ignore_fail_n_sop, will have this case)
1	RW	0	do not use SOP input ( check FEC sync byte instead )
0	RW	0	ignore fec_error bit when non sop ( check error on SOP only)

**FEC\_SYNC\_BYTE\_O 0x05**

Bit(s)	R/W	Default	Description
15:8	RW	187	demux package length - 1 ( default : 187 )
7:0	RW	0	default is 0x47

**FM\_WR\_DATA\_O 0x06**

Bit(s)	R/W	Default	Description
31:16	RW	0	filter memory write data hi[31:16]
15:0	RW	0	filter memory write data low [15:0]

**FM\_WR\_ADDR\_O 0x07**

Bit(s)	R/W	Default	Description
31:24	RW	0	advanced setting hi
23:16	RW	0	advanced setting low
15	R	0	filter memory write data request
7:0	R	0	filter memory write addr

**MAX\_FM\_COMP\_ADDR\_O 0x08**

Bit(s)	R/W	Default	Description
13:8	R	0	demux state -- read only
7:4	RW	0	maxnum section filter compare address
3:0	RW	0	maxnum PID filter compare address

**TS\_HEAD\_0\_O 0x09**

Bit(s)	R/W	Default	Description
15	RW	0	transport_error_indicator
14	RW	0	payload_unit_start_indicator
13	RW	0	transport_priority
12:0	RW	0	PID

**TS\_HEAD\_1\_O 0x0a**

Bit(s)	R/W	Default	Description
7:6	R	0	transport_scrambling_control
5:4	R	0	adaptation_field_control
3:0	R	0	continuity_counter

**OM\_CMD\_STATUS\_O 0x0b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:12	R	0	om_cmd_count (read only)
11:9	R	0	overflow_count // bit 11:9 -- om_cmd_wr_ptr (read only)
8:6	R	0	om_overwrite_count // bit 8:6 -- om_cmd_rd_ptr (read only)
5:3	R	0	type_stb_om_w_rd (read only)
2	R	0	unit_start_stb_om_w_rd (read only)
1	R	0	om_cmd_overflow (read only)
0	R	0	om_cmd_pending (read)
0	R	0	om_cmd_read_finished (write)

**OM\_CMD\_DATA\_O 0x0c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:9	R	0	count_stb_om_w_rd (read only)
8:0	R	0	start_stb_om_wa_rd (read only)

**OM\_CMD\_DATA2\_O 0x0d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11:0	R	0	offset for section data

**SEC\_BUFF\_01\_START\_O 0x0e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0	base address for section buffer group 0 (*0x400 to get real address)
15:0	RW	0	base address for section buffer group 1 (*0x400 to get real address)

**SEC\_BUFF\_23\_START\_O 0x0f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0	base address for section buffer group 2 (*0x400 to get real address)
15:0	RW	0	base address for section buffer group 3 (*0x400 to get real address)

**SEC\_BUFF\_SIZE\_O 0x10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
3:0	RW	0	section buffer size for group 0 (bitused, for example, 10 means 1K)
7:4	RW	0	section buffer size for group 1

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11:8	RW	0	section buffer size for group 2
15:12	RW	0	section buffer size for group 3

**SEC\_BUFF\_BUSY\_O 0x11**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R	0	Section buffer busy status for buff 31:0 (Read Only)

**SEC\_BUFF\_READY\_O 0x12**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	section buffer write status for buff 31:0 -- Read clear buffer status ( buff READY and BUSY ) – write

**SEC\_BUFF\_NUMBER\_O 0x13**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
4:0	RW	0	SEC_BUFFER_INDEX RW
12:8	RW	0	SEC_BUFFER_NUMBER for the INDEX buffer Read_Only
14	RW	0	output_section_buffer_valid
15	RW	0	section_reset_busy (Read Only)

**ASSIGN\_PID\_NUMBER\_O 0x14**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
9:5	RW	0	BYPASS PID number
4:0	RW	0	PCR PID number

**VIDEO\_STREAM\_ID\_O 0x15**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	RW	0	for video2
15:0	RW	0	stream_id filter Bit(s) enable

**AUDIO\_STREAM\_ID\_O 0x16**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	RW	0	For audio

**SUB\_STREAM\_ID\_O 0x17**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	RW	0	For sub

**OTHER\_STREAM\_ID\_O 0x18**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	RW	0	For other

**PCR90K\_CTL\_O 0x19**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12	RW	0	PCR_EN
11:0	RW	0	PCR90K_DIV

**PCR\_DEMUX\_O 0x1a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	PCR

**VIDEO\_PTS\_DEMUX\_O 0x1b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	VPTS

**VIDEO\_DTS\_DEMUX\_O 0x1c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	VDTS

**AUDIO\_PTS\_DEMUX\_O 0x1d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	APTS

**SUB\_PTS\_DEMUX\_O 0x1e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	SPTS

**STB\_PTS\_DTS\_STATUS\_O 0x1f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R	0	SUB_PTS[32]
14	R	0	AUDIO_PTS[32]
13	R	0	VIDEO_DTS[32]
12	R	0	VIDEO_PTS[32]
3	R	0	sub_pts_ready

2	R	0	audio_pts_ready
1	R	0	video_dts_ready
0	R	0	video_pts_ready

**STB\_DEBUG\_INDEX\_O 0x20**

Bit(s)	R/W	Default	Description
3	RW	0	pes_ctr_byte[7:0], pes_flag_byte[7:0]
2	RW	0	pes_package_bytes_left[15:0]
1	RW	0	stream_id[7:0], pes_header_bytes_left[7:0]
0	RW	0	adaptation_field_length[7:0], adaption_field_byte_1[7:0]

**STB\_DEBUG\_DATAOUT\_O 0x21**

Bit(s)	R/W	Default	Description
15:0	R	0	Debug data out[15:0]

**STB\_MOM\_CTL\_O 0x22**

Bit(s)	R/W	Default	Description
31	RW	0	no_match_record_en
30:16	RW	0	reserved
15:9	RW	0	MAX OM DMA COUNT (default: 0x40)
8:0	RW	0	LAST ADDR OF OM ADDR (default: 127)

**STB\_INT\_STATUS\_O 0x23**

Bit(s)	R/W	Default	Description
12	R	0	INPUT_TIME_OUT
11	R	0	PCR_ready
10	R	0	audio_splicing_point
9	R	0	video_splicing_point
8	R	0	other_PES_int
7	R	0	sub_PES_int
6	R	0	discontinuity
5	R	0	duplicated_pack_found
4	R	0	New PDTS ready
3	R	0	om_cmd_buffer ready for access

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
2	R	0	section buffer ready
1	R	0	transport_error_indicator
0	R	0	TS ERROR PIN

**DEMUX\_ENDIAN\_O 0x24**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:21	RW	0	demux om write endian control for OTHER_PES_PACKET
20:18	RW	0	demux om write endian control for SCR_ONLY_PACKET
17:15	RW	0	demux om write endian control for SUB_PACKET
14:12	RW	0	demux om write endian control for AUDIO_PACKET
11:9	RW	0	demux om write endian control for VIDEO_PACKET
8:6	RW	0	demux om write endian control for else
5:3	RW	0	demux om write endian control for bypass
2:0	RW	0	demux om write endian control for section

**TS\_HIU\_CTL\_O 0x25**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:8	RW	0	last_burst_threshold
7	RW	0	use_hi_bsf interface
6:2	RW	0	fec_clk_div
1	RW	0	ts_source_sel
0	RW	0	Hiu TS generate enable

**SEC\_BUFF\_BASE\_O 0x26**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	RW	0	base address for section buffer start (*0x10000 to get real base)

**DEMUX\_MEM\_REQ\_EN\_O 0x27**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11	RW	0	mask bit for OTHER_PES_AHB_DMA_EN
10	RW	0	mask bit for SUB_AHB_DMA_EN
9	RW	0	mask bit for BYPASS_AHB_DMA_EN
8	RW	0	mask bit for SECTION_AHB_DMA_EN

7	RW	0	mask bit for recoder stream
6:0	RW	0	mask bit for each type

**VIDEO\_PDTs\_WR\_PTR\_O 0x28**

Bit(s)	R/W	Default	Description
31:0	RW	0	vb_wr_ptr for video PDTs

**AUDIO\_PDTs\_WR\_PTR\_O 0x29**

Bit(s)	R/W	Default	Description
31:0	RW	0	ab_wr_ptr for video PDTs

**SUB\_WR\_PTR\_O 0x2a**

Bit(s)	R/W	Default	Description
20:0	RW	0	SB_WRITE_PTR (sb_wr_ptr << 3 == byte write position)

**SB\_START\_O 0x2b**

Bit(s)	R/W	Default	Description
19:0	RW	0	SB_START (sb_start << 12 == byte address);

**SB\_LAST\_ADDR\_O 0x2c**

Bit(s)	R/W	Default	Description
20:0	RW	0	SB_SIZE (sb_size << 3 == byte size, 16M maximum)

**SB\_PES\_WR\_PTR\_O 0x2d**

Bit(s)	R/W	Default	Description
31:0	RW	0	sb_wr_ptr for sub PES

**OTHER\_WR\_PTR\_O 0x2e**

Bit(s)	R/W	Default	Description
31:21	RW	0	ob_wr_ptr for other PES
20:0	RW	0	OB_WRITE_PTR (ob_wr_ptr << 3 == byte write position)

**OB\_START\_O 0x2f**

Bit(s)	R/W	Default	Description
19:0	RW	0	OB_START (ob_start << 12 == byte address);

**OB\_LAST\_ADDR\_O 0x30**

Bit(s)	R/W	Default	Description

20:0	RW	0	OB_SIZE (ob_size << 3 == byte size, 16M maximum)
------	----	---	--

**OB\_PES\_WR\_PTR\_O 0x31**

Bit(s)	R/W	Default	Description
31:0	RW	0	ob_wr_ptr for sub PES

**STB\_INT\_MASK\_O 0x32**

Bit(s)	R/W	Default	Description
9	RW	0	splicing_point
8	RW	0	other_PES_int
7	RW	0	sub_PES_int
6	RW	0	discontinuity
5	RW	0	duplicated_pack_found
4	RW	0	New PDTS ready
3	RW	0	om_cmd_buffer ready for access
2	RW	0	section buffer ready
1	RW	0	transport_error_indicator
0	RW	0	TS ERROR PIN

**VIDEO\_SPLICING\_CTL\_O 0x33**

Bit(s)	R/W	Default	Description
15	RW	0	splicing VIDEO PID change enable
14:10	RW	0	VIDEO PID FILTER ADDRESS
9	RW	0	PES splicing active (Read Only)
8	RW	0	splicing active (Read Only)
7:0	RW	0	splicing countdown (Read Only)

**AUDIO\_SPLICING\_CTL\_O 0x34**

Bit(s)	R/W	Default	Description
15	RW	0	splicing AUDIO PID change enable
14:10	RW	0	AUDIO PID FILTER ADDRESS
9	RW	0	PES splicing active (Read Only)
8	RW	0	splicing active (Read Only)
7:0	RW	0	splicing countdown (Read Only)

**TS\_PACKAGE\_BYTE\_COUNT\_O 0x35**

Bit(s)	R/W	Default	Description
23:16	RW	0	M2TS_SKIP_BYTES
15:8	RW	0	LAST TS PACKAGE BYTE COUNT (Read Only)
7:0	RW	0	PACKAGE BYTE COUNT (Read Only)

**PES\_STRONG\_SYNC\_O 0x36**

Bit(s)	R/W	Default	Description
15:0	RW	0	2 bytes strong sync add to PES

**OM\_DATA\_RD\_ADDR\_O 0x37**

Bit(s)	R/W	Default	Description
15	RW	0	stb_om_ren
14:11	RW	0	reserved
10:0	RW	0	OM_DATA_RD_ADDR

**OM\_DATA\_RD\_O 0x38**

Bit(s)	R/W	Default	Description
15:0	RW	0	OM_DATA_RD

**SECTION\_AUTO\_STOP\_3\_O 0x39**

Bit(s)	R/W	Default	Description
31	RW	0	Auto stop count 31 Wr_en
30:28	RW	0	Auto stop count 31
27	RW	0	Auto stop count 30 Wr_en
26:24	RW	0	Auto stop count 30
23	RW	0	Auto stop count 29 Wr_en
22:20	RW	0	Auto stop count 29
19	RW	0	Auto stop count 28 Wr_en
18:16	RW	0	Auto stop count 28
15	RW	0	Auto stop count 27 Wr_en
14:12	RW	0	Auto stop count 27
11	RW	0	Auto stop count 26 Wr_en
10:8	RW	0	Auto stop count 26

7	RW	0	Auto stop count 25 Wr_en
6:4	RW	0	Auto stop count 25
3	RW	0	Auto stop count 24 Wr_en
2:0	RW	0	Auto stop count 24

**SECTION\_AUTO\_STOP\_2\_O 0x3a**

Bit(s)	R/W	Default	Description
31	RW	0	Auto stop count 23 Wr_en
30:28	RW	0	Auto stop count 23
27	RW	0	Auto stop count 22 Wr_en
26:24	RW	0	Auto stop count 22
23	RW	0	Auto stop count 21 Wr_en
22:20	RW	0	Auto stop count 21
19	RW	0	Auto stop count 20 Wr_en
18:16	RW	0	Auto stop count 20
15	RW	0	Auto stop count 19 Wr_en
14:12	RW	0	Auto stop count 19
11	RW	0	Auto stop count 18 Wr_en
10:8	RW	0	Auto stop count 18
7	RW	0	Auto stop count 17 Wr_en
6:4	RW	0	Auto stop count 17
3	RW	0	Auto stop count 16 Wr_en
2:0	RW	0	Auto stop count 16

**SECTION\_AUTO\_STOP\_1\_O 0x3b**

Bit(s)	R/W	Default	Description
31	RW	0	Auto stop count 15 Wr_en
30:28	RW	0	Auto stop count 15
27	RW	0	Auto stop count 14 Wr_en
26:24	RW	0	Auto stop count 14
23	RW	0	Auto stop count 13 Wr_en

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
22:20	RW	0	Auto stop count 13
19	RW	0	Auto stop count 12 Wr_en
18:16	RW	0	Auto stop count 12
15	RW	0	Auto stop count 11 Wr_en
14:12	RW	0	Auto stop count 11
11	RW	0	Auto stop count 10 Wr_en
10:8	RW	0	Auto stop count 10
7	RW	0	Auto stop count 9 Wr_en
6:4	RW	0	Auto stop count 9
3	RW	0	Auto stop count 8 Wr_en
2:0	RW	0	Auto stop count 8

**SECTION\_AUTO\_STOP\_0\_O 0x3c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0	Auto stop count 7 Wr_en
30:28	RW	0	Auto stop count 7
27	RW	0	Auto stop count 6 Wr_en
26:24	RW	0	Auto stop count 6
23	RW	0	Auto stop count 5 Wr_en
22:20	RW	0	Auto stop count 5
19	RW	0	Auto stop count 4 Wr_en
18:16	RW	0	Auto stop count 4
15	RW	0	Auto stop count 3 Wr_en
14:12	RW	0	Auto stop count 3
11	RW	0	Auto stop count 2 Wr_en
10:8	RW	0	Auto stop count 2
7	RW	0	Auto stop count 1 Wr_en
6:4	RW	0	Auto stop count 1
3	RW	0	Auto stop count 0 Wr_en
2:0	RW	0	Auto stop count 0

**DEMUX\_CHANNEL\_RESET\_O 0x3d**

Bit(s)	R/W	Default	Description
31:0	R	0	Bit 31:0 reset channel status - Each Bit reset each channel

**DEMUX\_SCRAMBLING\_STATE\_O 0x3e**

Bit(s)	R/W	Default	Description
31:0	R	0	Scrambling state of each channel

**DEMUX\_CHANNEL\_ACTIVITY\_O 0x3f**

Bit(s)	R/W	Default	Description
31:0	R	0	Channel activity of each channel

**DEMUX\_STAMP\_CTL\_O 0x40**

Bit(s)	R/W	Default	Description
4	RW	0	video_stamp_use_dts
3	RW	0	audio_stamp_sync_1_en
2	RW	0	audio_stamp_insert_en
1	RW	0	video_stamp_sync_1_en
0	RW	0	video_stamp_insert_en

**DEMUX\_VIDEO\_STAMP\_SYNC\_0\_O 0x41**

Bit(s)	R/W	Default	Description
31:0	RW	0	Video stamp sync [63:32]

**DEMUX\_VIDEO\_STAMP\_SYNC\_1\_O 0x42**

Bit(s)	R/W	Default	Description
31:0	RW	0	Video stamp sync [31:0]

**DEMUX\_AUDIO\_STAMP\_SYNC\_0\_O 0x43**

Bit(s)	R/W	Default	Description
31:0	RW	0	Aideo stamp sync [63:32]

**DEMUX\_AUDIO\_STAMP\_SYNC\_1\_O 0x44**

Bit(s)	R/W	Default	Description
31:0	RW	0	Aideo stamp sync [31:0]

**DEMUX\_SECTION\_RESET\_O 0x45**

Bit(s)	R/W	Default	Description
31:0	R	0	Write : Bit[4:0] sector filter number for reset Read : select according to output_section_buffer_valid: per bit per section buffer valid status or section_buffer_ignore

**DEMUX\_INPUT\_TIMEOUT\_C\_O 0x46**

Bit(s)	R/W	Default	Description
31:0	RW	0	channel_reset_timeout_disable

**DEMUX\_INPUT\_TIMEOUT\_O 0x47**

Bit(s)	R/W	Default	Description
31	RW	0	no_match_reset_timeout_disable
30:0	RW	0	input_time_out_int_cnt (0 -- means disable) Wr-setting, Rd-count

**DEMUX\_PACKET\_COUNT\_O 0x48**

Bit(s)	R/W	Default	Description
31:0	RW	0	channel_packet_count_disable

**DEMUX\_PACKET\_COUNT\_C\_O 0x49**

Bit(s)	R/W	Default	Description
31	RW	0	no_match_packet_count_disable
30:0	RW	0	input_packet_count

**DEMUX\_CHAN\_RECORD\_EN\_O 0x4a**

Bit(s)	R/W	Default	Description
31:0	RW	0xffffffff	channel_record_enable

**DEMUX\_CHAN\_PROCESS\_EN\_O 0x4b**

Bit(s)	R/W	Default	Description
31:0	RW	0xffffffff	channel_process_enable

**DEMUX\_SMALL\_SEC\_CTL\_O 0x4c**

Bit(s)	R/W	Default	Description
31:24	RW	0	small_sec_size ((n+1) * 256 Bytes)
23:16	RW	0	small_sec_rd_ptr
15:8	RW	0	small_sec_wr_ptr
7:2	RW	0	reserved

1	RW	0	small_sec_wr_ptr_wr_enable
0	RW	0	small_section_enable

## 10.2 Video Output

### 10.2.1 Overview

This section describes A311D's VPU sub-module, including RDMA sub-module, VIU sub-module, HDMITX sub-module, CVBS sub-module and MIPI\_DSI sub-module.

### 10.2.2 VPU

VPU is display process unit, the main function is to receive data from decoder/ddr/hdmirx etc, then process the source data in order to get the high-quality video picture, and finally send out the video to the screen by HDMITX/CVBS/MIPI etc.

### 10.2.3 Register Description

#### 10.2.3.1 VPU Registers

##### VPU\_VDIN\_PRE\_ARB\_CTRL 0x2714

Bit(s)	R/W	Default	Description
31	R/W	0	VDIN_PREARB_SOFT_RESET: 1=SW reset vdin_mmc_pre_arb.
30-18	R	0	Reserved.
17	R/W	1	VDIN_ACG_EN: 1=Enable auto-clock gating of vdin_mmc_pre_arb.
16	R/W	0	VDIN_DISABLE_CLK: 1=Disable the clock to vdin_mmc_pre_arb.
15-0	R/W	0xffff	VDIN_REQ_EN: vdin_mmc_pre_arb request enable.

##### VPU\_VDISP\_PRE\_ARB\_CTRL 0x2715

Bit(s)	R/W	Default	Description
31	R/W	0	VDISP_PREARB_SOFT_RESET: 1=SW reset vdisp_mmc_pre_arb.
30-18	R	0	Reserved.
17	R/W	1	VDISP_ACG_EN: 1=Enable auto-clock gating of vdisp_mmc_pre_arb.
16	R/W	0	VDISP_DISABLE_CLK: 1=Disable the clock to vdisp_mmc_pre_arb.
15-0	R/W	0xffff	VDISP_REQ_EN: vdisp_mmc_pre_arb request enable.

##### VPU\_VPUARB2\_PRE\_ARB\_CTRL 0x2716

Bit(s)	R/W	Default	Description
31	R/W	0	VPUARB2_PREARB_SOFT_RESET: 1=SW reset vpuarb2_mmc_pre_arb.
30-18	R	0	Reserved.
17	R/W	1	VPUARB2_ACG_EN: 1=Enable auto-clock gating of vpuarb2_mmc_pre_arb.

16	R/W	0	VPUARB2_DISABLE_CLK: 1=Disalbe the clock to vpuarb2_mmc_pre_arb.
15-0	R/W	0xffff	VPUARB2_REQ_EN: vpuarb2_mmc_pre_arb request enable.

**VPU\_VIU\_VENC\_MUX\_CTRL 0x271a**

Bit(s)	R/W	Default	Description
17-16	W	0	RASP DPI CLOCK SEL : 00 : cph1 01 : cph2 10/11 : cph3
11-8	R/W	0	<p>VIU_VDIN_SEL_DATA: Select which data to VDI6 path, must clear it first before switching the data.</p> <p>4'b0000: Disable VIU to VDI6 path          4'b0001: Select ENCI data to VDI6          4'b0010: Select ENCP data to VDI6          4'b0100: Select ENCT data to VDI6          4'b1000: Select ENCL data to VDI6</p>
7-4	R/W	0	<p>VIU_VDIN_SEL_CLK: Select which clock to VDI6 path, must clear it first before switching the clock.</p> <p>4'b0000: Disable VIU to VDI6 clock          4'b0001: Select ENCI clock to VDI6          4'b0010: Select ENCP clock to VDI6          4'b0100: Select ENCT clock to VDI6          4'b1000: Select ENCL clock to VDI6</p>
3-2	R/W	0	<p>VIU2_SEL_VENC: Select which one of the encl/P/T/L that Viu2 connects to.</p> <p>0: ENCL          1: ENCI          2: ENCP          3: ENCT</p>
1-0	R/W	0	<p>VIU1_SEL_VENC: Select which one of the encl/P/T/L that Viu1 connects to.</p> <p>0: ENCL          1: ENCI          2: ENCP          3: ENCT</p>

**VPU\_HDMI\_SETTING 0x271b**

Bit(s)	R/W	Default	Description
15-12	R/W	0	<p>RD_RATE: Read rate to the async FIFO between VENC and HDMI.</p> <p>0: One read every rd_clk          1: One read every 2 rd_clk</p>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			2: One read every 3 rd_clk ... 15: One read every 16 rd_clk
11-8	R/W	0	WR_RATE: Write rate to the async FIFO between VENC and HDMI. 0: One write every wr_clk 1: One write every 2 wr_clk 2: One write every 3 wr_clk ... 15: One write every 16 wr_clk
7-5	R/W	0	DATA_COMP_MAP: Input data is CrYCr(BRG), map the output data to desired format: 0: output CrYCb (BRG) 1: output YCbCr (RGB) 2: output YCrCb (RBG) 3: output CbCrY (GBR) 4: output CbYCr (GRB) 5: output CrCbY (BGR) 6,7: Reserved
4	R/W	0	INV_DVI_CLK: If true, invert the polarity of clock output to external DVI interface. (NOT internal HDMI).
3	R/W	0	INV_VSYNC: If true, invert the polarity of VSYNC input from VENC
2	R/W	0	INV_HSYNC: If true, invert the polarity of HSYNC input from VENC
1-0	R/W	0	SRC_SEL: Select which HDMI source from between ENCI and ENCP. 2'b00: Disable HDMI source 2'b01: Select ENCI data to HDMI 2'b10: Select ENCP data to HDMI

**ENCI\_INFO\_READ 0x271c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Current ENCI field status.
28-25	R	0	Reserved
24-16	R	0	Current ENCI line counter status.
15-11	R	0	Reserved
10-0	R	0	Current ENCI pixel counter status.

**ENCP\_INFO\_READ 0x271d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31-29	R	0	Current ENCP field status.
28-16	R	0	Current ENCP line counter status.
15-13	R	0	Reserved
12-0	R	0	Current ENCP pixel counter status.

**ENCT\_INFO\_READ 0x271e**

Bit(s)	R/W	Default	Description
31-29	R	0	Current ENCT field status.
28-16	R	0	Current ENCT line counter status.
15-13	R	0	Reserved
12-0	R	0	Current ENCT pixel counter status.

**ENCL\_INFO\_READ 0x271f**

Bit(s)	R/W	Default	Description
31-29	R	0	Current ENCL field status.
28-16	R	0	Current ENCL line counter status.
15-13	R	0	Reserved
12-0	R	0	Current ENCL pixel counter status.

**VPU\_SW\_RESET 0x2720**

Bit(s)	R/W	Default	Description
3	R/W	0	vpuarb2_mmc_arb_rst_n
2	R/W	0	vdisp_mmc_arb_rst_n
1	R/W	0	vdin_mmc_arb_rst_n
0	R/W	0	viu_rst_n

**VPU\_CLK\_GATE 0x2723**

Bit(s)	R/W	Default	Description
30-18	R/W	0x0	Reserved
17	R/W	0x1	Clk_b control register no latch
16	R/W	0x1	Clk_vib enable
15	R/W	0x1	Gvapbclk enable
14	R/W	0x1	Clk mpeg vlock enable
13	R/W	0x1	Reserved

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12	R/W	0x1	Venc_dac_process_clk enable
11	R/W	0x1	Venc_i_top enable
10	R/W	0x1	Venci_int enable
9:8	R/W	0x11	Clk_vib latch sync source select 00: di2ldim_go_field, 01: post_frame_RST;10: pre_frame_RST, 11:viu_go_field
7	R/W	0x1	Reserved
6	R/W	0x1	Vpu_misc_clk enable
5	R/W	0x1	Venc_l_top enable
4	R/W	0x1	Venc_l_int enable
3	R/W	0x1	Venc_p_int enable
2	R/W	0x1	Reserved
1	R/W	0x1	Vi_top clock enable
0	R/W	0x1	Venc_p_top enable

**VPU\_HDMI\_DATA\_OVR 0x2727**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	DATA_OVR_EN: Control if override HDMI input data with DATA_OVR[29:0], for display e.g. black or blue screen. 0: No override 1: Enable override
30	R	0	Reserved
29-0	R/W	0	DATA_OVR: programmable pixel data value for override.

**VPU\_VPU\_PWM\_V0 0x2730**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	reg_vpu_pwm_inv, 1: invert the pwm signal, active low
30-29	R/W	0	reg_vpu_pwm_src_sel, 00: encl, enct, encp
28-16	R/W	0	reg_vpu_pwm_v_end0
15-14	R/W	0	reg_vpu_pwm_setting_latch_mode
13	R/W	1	reg_vpu_pwm_vs_inv
12-0	R/W	0	reg_vpu_pwm_v_start0

**VPU\_VPU\_PWM\_V1 0x2731**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	reg_vpu_pwm_v_end1
12-0	R/W	0	reg_vpu_pwm_v_start1

**VPU\_VPU\_PWM\_V2 0x2732**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	reg_vpu_pwm_v_end2
12-0	R/W	0	reg_vpu_pwm_v_start2

**VPU\_VPU\_PWM\_V3 0x2733**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	reg_vpu_pwm_v_end3
12-0	R/W	0	reg_vpu_pwm_v_start3

**VPU\_VPU\_PWM\_H0 0x2734**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	reg_vpu_pwm_h_end0
12-0	R/W	0	reg_vpu_pwm_h_start0

**VPU\_VPU\_PWM\_H1 0x2735**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	reg_vpu_pwm_h_end1
12-0	R/W	0	reg_vpu_pwm_h_start1

**VPU\_VPU\_PWM\_H2 0x2736**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	reg_vpu_pwm_h_end2
12-0	R/W	0	reg_vpu_pwm_h_start2

12-0	R/W	0	reg_vpu_pwm_h_start3

**VPU\_VPU\_3D\_SYNC1 0x2738**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31	R/W	0	reg_3dsync_enable, 1: enable 3d sync output
30	R/W	0	3dsync setting vsync latch
29	R/W	0	3dsync go high field polarity: 1, go high while field[0]=1
28-16	R/W	0	reg_3dsync_v_end0
15	R/W	0	3dsync out inv
14	R/W	0	3dsync vbo out inv
13	R/W	1	Vbo 3d en, to v by one, 3d enable
12-0	R/W	0	reg_3dsync_v_start0

**VPU\_VPU\_3D\_SYNC2 0x2739**

Bit(s)	R/W	Default	Description
31	R/W	0	Reg_3dsync_field_bit_sel: 1. Keep 3dsync not changed for two fields, i.e. L-L-R-R-L-L-R-R (11001100) 0. Change 3dsync every field i.e. L-R-L-R (1010)
28-16	R/W	0	reg_3dsync_h_end
12-0	R/W	0	reg_3dsync_h_start

**VPU\_HDMI\_FMT\_CTRL 0x2743**

Bit(s)	R/W	Default	Description
12 bit to 10 bit dither control register. 10 bit to 8 bit see VPU_HDMI_DITH_CNTL			
21-19	R/W	0	rame count offset for B
18-16	R/W	0	frame count offset for G
15	R/W	0	hcnt hold when de valid
14	R/W	0	RGB frame count seperate
13	R/W	0	dith4x4 : frame random enable
12	R/W	0	dith4x4 enable
11	R/W	0	tunnel enable for DOLBY
10	R/W	0	rounding enable
9-6	R/W	0	Cntl_hdmi_dith10 :
5	R/W	0	Cntl_hdmi_dith_md:
4	R/W	0	Cntl_hdmi_dith_en: dither 10-b to 8-b enable

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
3-2	R/W	0	Cntl_chroma_dnsmp: Chroma down sample mode when convert to 422 or 420. 0 = use pixel 0; 1 = use pixel 1; 2 = use average;
1-0	R/W	0	Cntl_hdmi_vid_fmt: Control whether to convert ENCP's 444 data to 422 or 420 0 = No conversion; 1 = Convert to 422; 2 = Convert to 420;

**PU\_VDIN\_ASYNC\_HOLD\_CTRL 0x2744**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	'h18	Wr_hold_num
23-16	R/W	'h10	Wr_rel_num
15-8	R/W	'h18	Rd_hold_num

3	R/W	0x0	Loop0 adjust pll enable
2	R/W	0x0	Overwrite accum1 enable
1	R/W	0x0	Loop1 adjust capture enable
0	R/W	0x0	Loop0 adjust pll enable

**VPU\_VLOCK\_MISC\_CTRL 0x3001**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-24	R/W	0x0	Adj_capt_pxgrouptrs, make sure the pixel number in one line of encoder is multiples of 2^pxgrouptrs
23-16	R/W	0x0	Ifrm_cnt_mod: (output vsync freq)/(input vsync_freq * ifrm_cnt_mod) must be integer
15-8	R/W	0x0	Output vsync frequency
7-0	R/W	0x0	Input vsync frequency

**VPU\_VLOCK\_LOOP0\_ACCUM\_LMT 0x3002**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-0	R/W	0x0	LOOP0 accumulator limit

**VPU\_VLOCK\_LOOP0\_CTRL0 0x3003**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0x0	Loop0 errclip rate
23-20	R/W	0x0	Loop0_adj_pll_rs, right shift of loop0 adjust pll portion
19-12	R/W	0x0	Loop0_adj_pll_gain, u1.7
11-8	R/W	0x0	Loop0_adj_capt_rs, right shift of loop0 adjust capture portion
7-0	R/W	0x0	Loop0_adj_capt_gain

**VPU\_VLOCK\_LOOP0\_CTRL1 0x3004**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-20	R/W	0x0	Loop1_adj_pll_rs
19-12	R/W	0x0	Loop1_adj_pll_gain
11-8	R/W	0x0	Loop1_adj_capt_rs
7-0	R/W	0x0	Loop1_adj_capt_gain

**VPU\_VLOCK\_LOOP1\_IMISSYNC\_MAX 0x3005**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R/W	0x0	Loop1 imissync max, input signal is missed after input vsync counter is larger than this max threshold

**VPU\_VLOCK\_LOOP1\_IMISSYNC\_MIN 0x3006**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R/W	0x0	Loop1 imissync min, input signal is missed after input vsync counter is less than this max threshold

**VPU\_VLOCK\_OVERWRITE\_ACCUM0 0x3007**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R/W	0x0	Overwrite value of accum0

**VPU\_VLOCK\_OVERWRITE\_ACCUM1 0x3008**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R/W	0x0	Overwrite value of accum1

**VPU\_VLOCK\_OUTPUT0\_CAPT\_LMT 0x3009**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-0	R/W	0x0	Output0 capture limit

**VPU\_VLOCK\_OUTPUT0\_PLL\_LMT 0x300a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-0	R/W	0x0	Output0 pll limit

**VPU\_VLOCK\_OUTPUT1\_CAPT\_LMT 0x300b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-0	R/W	0x0	Output1 capture limit

**VPU\_VLOCK\_OUTPUT1\_PLL\_LMT 0x300c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-0	R/W	0x0	Output1 pll limit

**VPU\_VLOCK\_LOOP1\_PHSDIF\_TARGET 0x300d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R/W	0x0	Loop1 phase difference target, (input vsync - output vsync) phase distance target

**VPU\_VLOCK\_RO\_LOOP0\_ACCUM 0x300e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R	0x0	Read only, loop0 accum result

**VPU\_VLOCK\_RO\_LOOP1\_ACCUM 0x300f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R	0x0	Read only, loop1 accum result

**VPU\_VLOCK\_OROW\_OCOL\_MAX 0x3010**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

29-16	R/W	0x0	Ocol_max
13-0	R/W	0x0	Orow_max

**VPU\_VLOCK\_RO\_VS\_I\_D 0x3011**

Bit(s)	R/W	Default	Description
27-0	R	0x0	Read only, input vsync counter

**VPU\_VLOCK\_RO\_VS\_O\_D 0x3012**

Bit(s)	R/W	Default	Description
27-0	R	0x0	Read only, output vsync counter

**VPU\_VLOCK\_RO\_LINE\_PIX\_ADJ 0x3013**

Bit(s)	R/W	Default	Description
29-16	R	0x0	Read only, encoder line adjust number
13-0	R	0x0	Read only, encoder pix adjust number

**VPU\_VLOCK\_RO\_OUTPUT\_00\_01 0x3014**

Bit(s)	R/W	Default	Description
31-16	R	0x0	Read only, accum0 output 00
15-0	R	0x0	Read only, accum0 output 01

**VPU\_VLOCK\_RO\_OUTPUT\_10\_11 0x3015**

Bit(s)	R/W	Default	Description
31-16	R	0x0	Read only, accum1 output 10
15-0	R	0x0	Read only, accum1 output 11

**VPU\_VLOCK\_MX4096 0x3016**

Bit(s)	R/W	Default	Description
20-0	R/W	0x0	Mx4096

**VPU\_VLOCK\_STBDET\_WIN0\_WIN1 0x3017**

Bit(s)	R/W	Default	Description
15-8	R/W	0x0	Verr_stbdet_win1
7-0	R/W	0x0	Verr_stbdet_win0

**VPU\_VLOCK\_STBDET\_CLP 0x3018**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-8	R	0x0	Read only, ro_verr_clp_win1, verr_clp number in win0
7-0	R	0x0	Read only, ro_verr_clp_win0, verr clp number in win1

**VPU\_VLOCK\_STBDET\_ABS\_WIN0 0x3019**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-0	R	0x0	Read only, ro_verr_abs_win0

**VPU\_VLOCK\_STBDET\_ABS\_WIN1 0x301a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-0	R	0x0	Read only, ro_verr_abs_win1

**VPU\_VLOCK\_STBDET\_SGN\_WIN0 0x301b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-0	R	0x0	Read only, ro_verr_sgn_win0

**VPU\_VLOCK\_STBDET\_SGN\_WIN1 0x301c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-0	R	0x0	Read only, ro_verr_sgn_win1

**VPU\_VLOCK\_ADJ\_EN\_SYNC\_CTRL 0x301d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0x0	PLL adjust enable signal sync ctrl, adj_en_for_pll_end, end counter of adj_en_pll signal fall to 0
23-16	R/W	0x0	PLL adjust enable signal sync ctrl, adj_en_for_pll_start, start counter of adj_en_pll signal go to 1, start must be larger than end
15-8	R/W	0x0	Adj_en_sync_latch_cnt, this is a delay to latch the adj_en signal
7-0	R/W	0x0	Adj_en_ext_cnt, extend the adj_en signal from vid_lock clock domain to pll sample domain, make sure it's wide enough

**VPU\_VLOCK\_GCLK\_EN 0x301e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
2	R/W	0x0	Ref clock enable
1	R/W	0x0	Vsout clk enable
0	R/W	0x0	Vsin clk enable

**VPU\_VLOCK\_LOOP1\_ACCUM\_LMT 0x301f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-0	R/W	0x0	LOOP1 accumulator limit

**VPU\_VLOCK\_RO\_M\_INT\_FRAC 0x3020**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29-16	R	0x0	Read only, m_int to PLL
13-0	R	0x0	Read only, m_frac to PLL

**10.2.3.5 DI\_RMEM\_IF0 Registers****DI\_IF0\_GEN\_REG 0x2030**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	ENABLE_FREE_CLK. 0: Gated clock for power saving 1: Free-running clock to drive logic
30	R/W	0	SW_RESET: Write 1 to this bit to generate a pulse to reset everything except registers.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29	R/W	0	RESET_ON_GO_FIELD: Define whether to reset state machines on go_field pulse. 0: No reset on go_field 1: go_field reset everything except registers
28	R/W	0	URGENT_CHROMA: Set urgent level for chroma fifo request from DDR. 0: Non urgent 1: Urgent
27	R/W	0	URGENT_LUMA: Set urgent level for luma fifo request from DDR. 0: Non urgent 1: Urgent
26	R/W	0	Chroma_end_at_last_line: For chroma line, similar to luma_end_at_last_line, as below. Not used if data are stored together in one canvas.
25	R/W	0	Luma_end_at_last_line: Control whether continue outputting luma line past last line. 0: Repeat the last line or dummy pixels, after past the last line 1: Stop outputting data, once past the last line.
24-19	R/W	4	Hold_lines: After go_field, the number of lines to hold before the module is enabled.
18	R/W	0	LAST_LINE: This bit controls whether we simply repeat the last line or we push dummy pixels. '1' tells the state-machines to repeat the last line using the dummy pixels defined in the register below. '0' indicates that the state-machine should re-read the last line of real data.
17	R	0	Busy status of the state-machines. '1' = busy, '0' = idle
16	R/W	0	DEMUX_MODE: 0 = 4:2:2, 1 = RGB (24-bit). This value is used to control the demuxing logic when the picture is stored together. When a picture is stored together, the data is read into a single FIFO (the Y FIFO) and must be demultiplexed into the "drain" outputs. In the case of 4:2:2 the data is assumed to be stored in memory in 16-bit chunks: <YCb><YCr><YCb><YCr>... the Y, Cb and Cr 8-bit values are pulled from the single Y-FIFO and sent out in pairs. This value is only valid when the picture is stored together. If the picture is separated into different canvases, then this bit field is ignored.
15-14	R/W	0	BYTES_PER_PIXEL: This value is used to determine how many bytes are associated with each pixel. 0: This value should be used if the image is stored separately (e.g. RGB or Y, Cb, Cr). 1: This value should be used if the data is 4:2:2 data stored together. In this case each pixel, YCb or YCr, is 16-bits (two bytes). 2: This value should be used if the RGB (24-bit) data is stored together. 3: reserved for future use (alpha RGB).
13-12	R/W	0	DDR_BURST_SIZE_CR: This value is used to control the DDR burst request size for the Cr FIFO. 0: Maximum burst = 24 64-bit values 1: Maximum burst = 32 64-bit values 2: Maximum burst = 48 64-bit values 3: Maximum burst = 64 64-bit values

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11-10	R/W	0	<p>DDR_BURST_SIZE_CB: This value is used to control the DDR burst request size for the Cb FIFO.</p> <p>0: Maximum burst = 24 64-bit values      1: Maximum burst = 32 64-bit values      2: Maximum burst = 48 64-bit values      3: Maximum burst = 64 64-bit values</p>
9-8	R/W	0	<p>DDR_BURST_SIZE_Y: This value is used to control the DDR burst request size for the Y FIFO.</p> <p>0: Maximum burst = 24 64-bit values      1: Maximum burst = 32 64-bit values      2: Maximum burst = 48 64-bit values      3: Maximum burst = 64 64-bit values</p>
7	R/W	0	MANUAL_START_FRAME: non-latching bit that can be used to simulate the go_field signal for simulation.
6	R/W	0	CHRO_RPT_LASTL_CTRL: This bit controls whether to allow VPP's chroma-repeat request. 0: Chroma-repeat pulses from VPP are ignored 1: Chroma-repeat pulses from VPP are used.
5	R/W	0	Unused
4	R/W	0	LITTLE_ENDIAN: This bit defines the endianness of the memory data . 0: Pixel data are stored big-endian in memory 1: Pixel data are stored little-endian in memory
3	R/W	0	Chroma_hz_avg: For chroma line output control, similar to luma_hz_avg, as below. Not used if data are stored together in one canvas.
2	R/W	0	<p>Luma_hz_avg: Enable output half amount of data per line to save bandwidth.</p> <p>0: Output every pixel per line      1: Output half line, each data averaged between every 2 pixels</p> <p>Note: For 4:2:2 mode data stored together in one canvas, only do averaging over luma data.</p>
1	R/W	0	SEPARATE_EN: Set this bit to 1 if the image is in separate canvas locations.
0	R/W	0	ENABLE: This bit is set to 1 to enable the FIFOs and other logic. This bit can be set to 0 to cleanup and put the logic into an IDLE state.

**DI\_IF0\_CANVAS0 – Picture 0 0x2031**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	unused
23-16	R/W	0	CANVAS0_ADDR2: Canvas table address for picture 0 for component 2 (Cr FIFO). This value is ignored when the picture is stored together
15-8	R/W	0	CANVAS0_ADDR1: Canvas table address for picture 0 for component 1 (Cb FIFO). This value is ignored when the picture is stored together
7-0	R/W	0	CANVAS0_ADDR0: Canvas table address for picture 0 for component 0 (Y FIFO).

**DI\_IF0\_LUMA\_X0 – Picture 0 0x2032**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	Unused
30-16	R/W	0	LUMA_X_END0: Picture 0, luma X end value
15	R/W	0	Unused
14-0	R/W	0	LUMA_X_START0: Picture 0, luma X start value

**DI\_IF0\_LUMA\_Y0 – Picture 0 0x2033**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R/W	0	Unused
28-16	R/W	0	LUMA_Y_END0: Picture 0, luma Y end value
15-13	R/W	0	Unused
12-0	R/W	0	LUMA_Y_START0: Picture 0, luma Y start value

**DI\_IF0\_CHROMA\_X0 – Picture 0 0x2034**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	Unused
30-16	R/W	0	CHROMA_X_END0: Picture 0, chroma X end value. This value is only used when the picture is not stored together.
15	R/W	0	Unused
14-0	R/W	0	CHROMA_X_START0: Picture 0, chroma X start value. This value is only used when the picture is not stored together.

**DI\_IF0\_CHROMA\_Y0 – Picture 0 0x2035**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R/W	0	Unused
28-16	R/W	0	CHROMA_Y_END0: Picture 0, chroma Y end value. This value is only used when the picture is not stored together.
15-13	R/W	0	Unused
12-0	R/W	0	CHROMA_Y_START0: Picture 0, chroma Y start value. This value is only used when the picture is not stored together.

**DI\_IF0\_REPEAT\_LOOP – Pictures 0 and 1 0x2036**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	CHROMA_RPT_LOOP1: Repeat loop for Picture 1. Bits[6:4] = start loop pointer, bits [2:0] = end loop pointer. Bits [7] and [3] are ignored.

23-16	R/W	0	LUMA_RPT_LOOP1: Repeat loop for Picture 1. Bits[6:4] = start loop pointer, bits [2:0] = end loop pointer. Bits [7] and [3] are ignored.
15-8	R/W	0	CHROMA_RPT_LOOP0: Repeat loop for Picture 0. Bits[6:4] = start loop pointer, bits [2:0] = end loop pointer. Bits [7] and [3] are ignored.
7-0	R/W	0	LUMA_RPT_LOOP0: Repeat loop for Picture 0. Bits[6:4] = start loop pointer, bits [2:0] = end loop pointer. Bits [7] and [3] are ignored.

**DI\_IF0\_LUMA0\_RPT\_PAT – Picture 0 LUMA repeat pattern 0x2037**

Bit(s)	R/W	Default	Description
31-0	R/W	0	Luma repeat/skip pattern for picture 0

Bits	Pattern Index	Pattern description
31-28	7	<p>Repeat/skip pattern:</p> <p>Bit[3] = 0 indicates repeat.</p> <p>Bit[3] = 1 indicates either skip, or output this line and then skip. How to interpret this bit depends on the value of the previous pattern's Bit[3]. If previous Bit[3]=0, then skip; If previous Bit[3]=1, then output this line and then skip.</p> <p>Bits[2:0] indicate the skip / repeat count.</p> <p>Below is an example of consecutive patterns, the start line is line 0:</p> <ul style="list-style-type: none"> <li>{0010}    Repeat this line (line 0) two more times for a total of three line reads. Proceed to next line (line 1).</li> <li>{0000}    Don't repeat this line (line 1). This line will be read just once. Proceed to next line (line 2).</li> <li>{1000}    Skip one line (line 2) to get to the next line (line 3). The skip implies that the next line (line 3) should be read at least once.</li> <li>{1011}    Read this line (line 3) once, and then skip the next four lines to get to the next line (line 8). The skip implies that the next line (line 8) should be read at least once.</li> <li>{0100}    Repeat this line (line 8) four more times for a total of five line read. Proceed to next line (line 9).</li> <li>{1001}    Skip two lines to get to the next line (line 11). The skip implies that the next line (line 11) should be read at least once.</li> </ul>
27-24	6	See pattern definition above.
23-20	5	See pattern definition above.
19-16	4	See pattern definition above.
15-12	3	See pattern definition above.
11-8	2	See pattern definition above.
7-4	1	See pattern definition above.

3-0	0	See pattern definition above.
-----	---	-------------------------------

**DI\_IF0\_CHROMA0\_RPT\_PAT – Picture 0 CHROMA repeat pattern 0x2038**

Bit(s)	R/W	Default	Description
31-0	R/W	0	Chroma repeat/skip pattern for picture 0. See picture 0 luma pattern for description. This value is only used when the picture is not stored together.

**DI\_IF0\_DUMMY\_PIXEL 0x2039**

Bit(s)	R/W	Default	Description
31-24	R/W	0	Y or R dummy pixel value
23-16	R/W	0	Cb or G dummy pixel value
15-8	R/W	0	Cr or B dummy pixel value
7-0	R/W	0	unused

**DI\_IF0\_LUMA\_FIFO\_SIZE 0x203A**

Bit(s)	R/W	Default	Description
8-0	W/R	128	fifo size

**DI\_IF0\_RANGE\_MAP\_Y 0x203B**

31-23	W/R	0	din offset
22-15	W/R	0	range map coef
13-10	W/R	0	range map din offset mult
9-1	W/R	0	dout offset
0	W/R	0	range map enable

**DI\_IF0\_RANGE\_MAP\_CB 0x203C**

31-23	W/R	0	din offset
22-15	W/R	0	range map coef
13-10	W/R	0	range map din offset mult
9-1	W/R	0	dout offset
0	W/R	0	range map enable

**DI\_IF0\_RANGE\_MAP\_CR 0x203D**

31-23	W/R	0	din offset
22-15	W/R	0	range map coef
13-10	W/R	0	range map din offset mult

9-1	W/R	0	dout offset
0	W/R	0	range map enable

Output data range conversion function:

$Y[n] = \text{clip}((\text{Round}((Y[n]+DIN\_OFFSET) * RANGE\_MAP\_COEF) / (1<<\text{RANGE\_MAP\_SR})) + DOUT\_OFFSET);$

To perform VC-1 range reduction, set the following:

DIN\_OFFSET = 0x180 = -128;

RANGE\_MAP\_COEF = RANGE\_MAP\_Y + 9

RANGE\_MAP\_SR = 3

DOUT\_OFFSET = 0x080 = 128

To get the equivalent function:

$Y[n] = \text{clip}(((Y[n]-128) * (RANGE_MAP_Y + 9) + 4) >> 3) + 128;$

Bit(s)	R/W	Default	Description
31-23	R/W	0	DIN_OFFSET
22-15	R/W	0	RANGE_MAP_COEF
14	R/W	0	unused
13-10	R/W	0	RANGE_MAP_SR
9-1	R/W	0	DOUT_OFFSET
0	R/W	0	RANGE_MAP_EN

#### DI\_IF0\_GEN\_REG2 0x203E

Bit(s)	R/W	Default	Description
31-2	R/W	0	unused
1-0	R/W	0	COLOR_MAP: Define color map for NV12 or NV21 mode. Only applicable when VD1_IF0_GEN_REG.SEPARATE_EN = 1. 0: NOT NV12 or NV21; 1: NV12 (CbCr); 2: NV21 (CrCb).

#### DI\_IF0\_FMT\_CTRL 0x203F

Bit(s)	R/W	Default	Description
31	R/W	0	gate_clk_en. 0=No clock gating, free-running; 1=Enable clock gating for power saving.
30	R/W	0	soft_rst. If true, reset formatters.
29	R/W	0	unused

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28	R/W	0	if true, horizontal formatter use repeating to generate pixel, otherwise use bilinear interpolation
27-24	R/W	0	horizontal formatter initial phase
23	R/W	0	horizontal formatter repeat pixel 0 enable
22-21	R/W	0	horizontal Y/C ratio, 00: 1:1, 01: 2:1, 10: 4:1
20	R/W	0	horizontal formatter enable
19	R/W	0	if true, always use phase0 while vertical formater, meaning always repeat data, no interpolation
18	R/W	0	if true, disable vertical formatter chroma repeat last line
17	R/W	0	vertical formatter dont need repeat line on phase0, 1: enable, 0: disable
16	R/W	0	vertical formatter repeat line 0 enable
15-12	R/W	0	vertical formatter skip line num at the beginning
11-8	R/W	0	vertical formatter initial phase
7-1	R/W	0	vertical formatter phase step (3.4)
0	R/W	0	vertical formatter enable

**DI\_IF0\_FMT\_W 0x2040**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0	horizontal formatter width
11-0	R/W	0	vertical formatter width

Bit(s)	R/W	Default	Description
7-0	W/R	0	chroma repeat loop

**DI\_CHAN2\_DUMMY\_PIXEL 0x17B2**

Bit(s)	R/W	Default	Description
31-0	W/R	0x808000	dummy pixel

**DI\_CHAN2\_LUMA\_FIFO\_SIZE 0x17B3**

Bit(s)	R/W	Default	Description
8-0	W/R	128	fifo size

**DI\_CHAN2\_RANGE\_MAP\_Y 0x17B4**

Bit(s)	R/W	Default	Description
31-23	W/R	0	din offset
22-15	W/R	0	range map coef
13-10	W/R	0	range map din offset mult
9-1	W/R	0	dout offset
0	W/R	0	range map enable

**DI\_CHAN2\_RANGE\_MAP\_CB 0x17B5**

Bit(s)	R/W	Default	Description
31-23	W/R	0	din offset
22-15	W/R	0	range map coef

13-10	W/R	0	range map din offset mult
9-1	W/R	0	dout offset
0	W/R	0	range map enable

**DI\_CHAN2\_RANGE\_MAP\_CR 0x17B6**

Bit(s)	R/W	Default	Description
31-23	W/R	0	din offset
22-15	W/R	0	range map coef
13-10	W/R	0	range map din offset mult
9-1	W/R	0	dout offset
0	W/R	0	range map enable

**DI\_CHAN2\_URGENT\_CTRL 0x17A6**

Bit(s)	R/W	Default	Description
13-16	W/R	0	urgent_ctrl_luma: bit 15: auto urgent_en bit 14: urgent_wr bit 7-4: up_threshold bit 3-0: down_threshold
15-0	W/R	0	urgent_ctrl_chroma: bit 15: auto urgent_en bit 14: urgent_wr bit 7-4: up_threshold bit 3-0: down_threshold

**DI\_CHAN2\_FMT\_CTRL 0x17B8**

Bit(s)	R/W	Default	Description
31	R/W	0	gate_clk_en. 0=No clock gating, free-running; 1=Enable clock gating for power saving.
30	R/W	0	soft_rst. If true, reset formatters.
29	R/W	0	unused
28	R/W	0	if true, horizontal formatter use repeating to generate pixel, otherwise use bilinear interpolation
27-24	R/W	0	horizontal formatter initial phase
23	R/W	0	horizontal formatter repeat pixel 0 enable
22-21	R/W	0	horizontal Y/C ratio, 00: 1:1, 01: 2:1, 10: 4:1
20	R/W	0	horizontal formatter enable

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19	R/W	0	if true, always use phase0 while vertical formater, meaning always repeat data, no interpolation
18	R/W	0	if true, disable vertical formatter chroma repeat last line
17	R/W	0	vertical formatter dont need repeat line on phase0, 1: enable, 0: disable
16	R/W	0	vertical formatter repeat line 0 enable
15-12	R/W	0	vertical formatter skip line num at the beginning
11-8	R/W	0	vertical formatter initial phase
7-1	R/W	0	vertical formatter phase step (3.4)
0	R/W	0	vertical formatter enable

**DI\_CHAN2\_FMT\_W 0x17B9**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0	horizontal formatter width
12-0	R/W	0	vertical formatter width

**DI\_NRWR\_CTRL 0x17C2**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	Pending_ddr_wrrsp_nrwr
30	R/W	0	Nrwr_reg_swap
29-26	R/W	0	Nrwr_burst_lim
25	R/W	0	Nrwr_canvas_syncen
24	R/W	0	Nrwr_no_clk_gate
23-22	R/W	0	Nrwr_rgb_mode , 0: 4:2:2 to one canvas; 1: 4:4:4 to one canvas; 2: Y to luma canvas, CbCr to chroma canvas, for NV12/21; 3: Reserved.
21-20	R/W	0	Nrwr_hconv_mode
19-18	R/W	0	Nrwr_vconv_mode
17	R/W	0	Nrwr_swap_cbcr
16	R/W	0	Nrwr_urgent
15-8	R/W	0	Nrwr_canvas_index_chroma
7-0	R/W	0	Nrwr_canvas_index_luma

**DI\_NRWR\_X 0x17C0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31	R/W	0	Nrwr_little_endian
30	R/W	0	Nrwr_rev_x
29-16	R/W	0	Nrwr_start_x
15-14	R/W	0	nrwr_words_lim[3:2]
13-0			Nrwr_end_x

**DI\_NRWR\_Y 0x17C1**

Bit(s)	R/W	Default	Description

7:0	W/R	20	reg_ei_int_drtdelay2_vlddrt_sadth

**DI\_EI\_DRT\_CTRL 0x1778**

Bit(s)	R/W	Default	Description
31	W/R	0	reg_rectg_en: Low angle enable.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30	W/R	0	reg_recbl_en: New and old drt blend enable.
29:28	W/R	2	reg_rectg_ws : window side to calculate the reference direction: 0:1x1; 1:1x3; 2:1x5; 3:1x7
27			reserved
26:24	W/R	2	reg_abq_margin : top and bottom curve trend quantilization margin of noise for direction assignments.
23			reserved
22:20	W/R	3	reg_trend_mg : the Margin of the top/bot trend.
19:16	W/R	1	reg_int_d16xc1 : Coring to drtf.
15:14			reserved
13:8	W/R	40	reg_int_chlmt1: Limit to drtf(16x) for chroma angle
7			reserved
6:4	W/R	5	reg_nscheck_thrd:check whether the pixels id noise or not.
3			reserved
2:0	W/R	7	reg_horsl_ws: window side to check the existent number of low angle drt, if the number<the value, drt=raw drt.

**DI\_EI\_DRT\_PIXTH 0x1779**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	W/R	22	reg_min_pix: the threshold of min pix of photos, <threshold the pix do not participate in the monotonic trend calculation.
23:16	W/R	203	reg_max_pix: the threshold of max pix of photos, >threshold the pix do not participate in the monotonic trend calculation.
15:8	W/R	50	reg_dmaxmin_thrdma: the max pixel and min pixel difference is larger than the value the trend existent.
7:0	W/R	30	reg_dmaxmin_thrdmi: the max pixel and min pixel difference is smaller than the value the trend non-existent.

**DI\_EI\_DRT\_CORRPIXTH 0x177a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	W/R	40	reg_newcorrpix_maxthrd:the new low angle drt sad threshold.
23:16	W/R	60	reg_corrpix_diffthrd: the top and bottom pixel difference is larger than the value, the case may be ultra-low angle.
15:8	W/R	10	reg_corrpix_minthrd: the difference of top and bottom pixel is smaller than the value, the drt may be raw drt.
7:0	W/R	20	reg_corrpix_maxthrd: the difference of top and bottom pixel is larger than the value, the drt may be raw drt.

**DI\_EI\_DRT\_RECTG\_WAVE 0x177b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29			reserved
28:24	W/R	0	reg_max_pixwave: the wave of the max pix threshold, prevent min pix close to reg_max_pix caused the number between max and min pix zeros.
23:21			reserved
20:16	W/R	15	reg_pix_wave: the wave of the max and min pix, the max pixel smaller than the value or the min pixel larger than the value, may be the ultra-low angle case.
15:14			reserved
13:8	W/R	40	reg_maxdrt_thrd: the threshold of the low angle max drt.
7:0	W/R	20	reg_wave_thrd:in bilateral cases tow pixel difference is smaller than the value, the trend between the tow pixel not change.

**DI\_EI\_DRT\_PIX\_DIFFTH 0x177c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	W/R	32	reg_newraw_thrd: the old drt and new drt transition threshold.
23:16	W/R	10	reg_tb_max_thrd: the threshold of top and bottom max or min pixel.
15:8	W/R	20	reg_diffpix_thrd: Max-Min<the value, the trend is non-existent.
7:6			reserved
5:0	W/R	5	reg_bilt_trendnumt: in bilateral cases the difference between the top and bottom pixel number of the monotonic trend smaller than the value is low angle.

**DI\_EI\_DRT\_UNBITREND\_TH 0x177d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:29			reserved
28:24	W/R	10	reg_trend_numb:in bilateral cases the pixel number of the monotonic trend larger than the value is low angle.
23:21			reserved
20:16	W/R	4	reg_bilt_trendnum:in bilateral cases the pixel number of the trend larger than the value is low angle.
15:13			reserved
12:8	W/R	7	reg_unil_trendnumt: in unilateral cases the difference between the top and bottom pixel number of the monotonic trend smaller than the value is low angle.
7:5			reserved
4:0	W/R	10	reg_trend_num: in unilateral cases the pixel number of the trend larger than the value is ultra-low angle.

### 10.2.3.8 NR2 Registers

#### DET3D\_MOTN\_CFG 0x1734

Bit(s)	R/W	Default	Description
16	R/W	0	reg_det3d_intr_en : Det3d interrupt enable
9:8	R/W	0	reg_Det3D_Motion_Mode : U2 Different mode for Motion Calculation of Luma and Chroma: 0 : MotY, 1: (2*MotY + (MotU + MotV))/4; 2: Max(MotY, MotU,MotV); 3:Max(MotY, (MotU+MotV)/2)
7:4	R/W	0	reg_Det3D_Motion_Core_Rate : U4 K Rate to Edge (HV) details for coring of Motion Calculations, normalized to 32
3:0	R/W	0	reg_Det3D_Motion_Core_Thrd : U4 2X: static coring value for Motion Detection.

#### DET3D\_CB\_CFG 0x1735

Bit(s)	R/W	Default	Description
7:4	R/W	0	reg_Det3D_ChessBd_HV_ofst : U4, Noise immune offset for Horizontal or vertical combing detection.
3:0	R/W	0	reg_Det3D_ChessBd_NHV_ofst : U4, Noise immune offset for NON-Horizontal or vertical combing detection.

#### DET3D\_SPLT\_CFG 0x1736

Bit(s)	R/W	Default	Description
7:4	R/W	0x0	reg_Det3D_SplitValid_ratio : U4, Ratio between max_value and the avg_value of the edge mapping for split line valid detection. The smaller of this value, the easier of the split line detected.
3:0	R/W	0x0	reg_Det3D_AvgIdx_ratio : U4, Ratio to the avg_value of the edge mapping for split line position estimation. The smaller of this value, the more samples will be added to the estimation.

#### DET3D\_HV\_MUTE 0x1737

Bit(s)	R/W	Default	Description
23:20	R/W	0x0	reg_Det3D_Edge_Ver_Mute : U4 X2: Horizontal pixels to be mute from H/V Edge calculation Top and Bottom border part.
19:16	R/W	0x0	reg_Det3D_Edge_Hor_Mute : U4 X2: Horizontal pixels to be mute from H/V Edge calculation Left and right border part.
15:12	R/W	0x0	reg_Det3D_ChessBd_Ver_Mute : U4 X2: Horizontal pixels to be mute from ChessBoard statistics calculation in middle part
11:8	R/W	0x0	reg_Det3D_ChessBd_Hor_Mute : U4 X2: Horizontal pixels to be mute from ChessBoard statistics calculation in middle part
7:4	R/W	0x0	reg_Det3D_STA8X8_Ver_Mute : U4 1X: Vertical pixels to be mute from 8x8 statistics calculation in each block.
3:0	R/W	0x0	reg_Det3D_STA8X8_Hor_Mute : U4 1X: Horizontal pixels to be mute from 8x8 statistics calculation in each block.

**DET3D\_MAT\_STA\_P1M1 0x1738**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x0	reg_Det3D_STA8X8_P1_K0_R8 : U8 SAD to SAI ratio to decide P1, normalized to 256 (0.8)
23:16	R/W	0x0	reg_Det3D_STA8X8_P1_K1_R7 : U8 SAD to ENG ratio to decide P1, normalized to 128 (0.5)
15:8	R/W	0x0	reg_Det3D_STA8X8_M1_K0_R6 : U8 SAD to SAI ratio to decide M1, normalized to 64 (1.1)
7:0	R/W	0x0	reg_Det3D_STA8X8_M1_K1_R6 : U8 SAD to ENG ratio to decide M1, normalized to 64 (0.8)

**DET3D\_MAT\_STA\_P1TH 0x1739**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0x0	reg_Det3D_STAYUV_P1_TH_L4 : U8 SAD to ENG Thrd offset to decide P1, X16 (100)
15:8	R/W	0x0	reg_Det3D_STAEDG_P1_TH_L4 : U8 SAD to ENG Thrd offset to decide P1, X16 (80)
7:0	R/W	0x0	reg_Det3D_STAMOT_P1_TH_L4 : U8 SAD to ENG Thrd offset to decide P1, X16 (48)

**DET3D\_MAT\_STA\_M1TH 0x173a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0x0	reg_Det3D_STAYUV_M1_TH_L4 : U8 SAD to ENG Thrd offset to decide M1, X16 (100)
15:8	R/W	0x0	reg_Det3D_STAEDG_M1_TH_L4 : U8 SAD to ENG Thrd offset to decide M1, X16 (80)
7:0	R/W	0x0	reg_Det3D_STAMOT_M1_TH_L4 : U8 SAD to ENG Thrd offset to decide M1, X16 (64)

**DET3D\_MAT\_STA\_RSFT 0x173b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:4	R/W	0x0	reg_Det3D_STAYUV_RSHFT : U2 YUV statistics SAD and SAI calculation result right shift bits to accommodate the 12bits clipping: 0 : mainly for images <=720x480: 1: mainly for images <=1366x768: 2: mainly for images <=1920X1080: 2; 3: other higher resolutions
3:2	R/W	0x0	reg_Det3D_STAEDG_RSHFT : U2 Horizontal and Vertical Edge Statistics SAD and SAI calculation result right shift bits to accommodate the 12bits clipping: 0 : mainly for images <=720x480: 1: mainly for images <=1366x768: 2: mainly for images <=1920X1080: 2; 3: other higher resolutions
1:0	R/W	0x0	reg_Det3D_STAMOT_RSHFT : U2 Motion SAD and SAI calculation result right shift bits to accommodate the 12bits clipping: 0 : mainly for images <=720x480: 1: mainly for images <=1366x768: 2: mainly for images <=1920X1080: 2; 3: other higher resolutions

**DET3D\_MAT\_SYMTC\_TH 0x173c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x0	reg_Det3D_STALUM_symtc_Th : U8 threshold to decide if the Luma statistics is TB or LR symmetric.
23:16	R/W	0x0	reg_Det3D_STACHR_symtc_Th : U8 threshold to decide if the Chroma (UV) statistics is TB or LR symmetric.
15:8	R/W	0x0	reg_Det3D_STAEDG_symtc_Th : U8 threshold to decide if the Horizontal and Vertical Edge statistics is TB or LR symmetric.
7:0	R/W	0x0	reg_Det3D_STAMOT_symtc_Th : U8 threshold to decide if the Motion statistics is TB or LR symmetric.

**DET3D\_RO\_DET\_CB\_HOR 0x173d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R.O	0x0	RO_Det3D_ChessBd_NHor_value : U16 X64: number of Pixels of Horizontally Surely NOT matching Chessboard pattern.
15:0	R.O	0x0	RO_Det3D_ChessBd_Hor_value : U16 X64: number of Pixels of Horizontally Surely matching Chessboard pattern.

**DET3D\_RO\_DET\_CB\_VER 0x173e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R.O	0x0	RO_Det3D_ChessBd_NVer_value : U16 X64: number of Pixels of Vertically Surely NOT matching Chessboard pattern.
15:0	R.O	0x0	RO_Det3D_ChessBd_Ver_value : U16 X64: number of Pixels of Vertically Surely matching Chessboard pattern.

**DET3D\_RO\_SPLT\_HT 0x173f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24	R.O	0x0	RO_Det3D_Split_HT_valid : U1 horizontal LR split border detected valid signal for top half picture
20:16	R.O	0x0	RO_Det3D_Split_HT_pxnum : U5 number of pixels included for the LR split position estimation for top half picture
9:0	R.O	0x0	RO_Det3D_Split_HT_idxX4 : S10 X4: horizontal pixel shifts of LR split position to the (ColMax/2) for top half picture

NR2 REG DEFINE BEGIN///

**NR2\_MET\_NM\_CTRL 0x1745**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28	R/W	0x0	reg_NM_reset : Reset to the status of the Loop filter.
27:24	R/W	0x0	reg_NM_calc_length : Length mode of the Noise measurement sample number for statistics. 0 : 256 samples; 1: 512 samples; 2: 1024 samples; j-X: 2^(8+x) samples

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:20	R/W	0x0	reg_NM_inc_step : Loop filter input gain increase step.
19:16	R/W	0x0	reg_NM_dec_step : Loop filter input gain decrease step.
15:8	R/W	0x0	reg_NM_YHPmot_thrd : Luma channel HP portion motion for condition of pixels included in Luma Noise measurement.
7:0	R/W	0x0	reg_NM_CHPmot_thrd : Chroma channel HP portion motion for condition of pixels included in Chroma Noise measurement.

**NR2\_MET\_NM\_YCTRL 0x1746**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0	reg_NM_YPLL_target : Target rate of NM_Ynoise_thrd to mean of the Luma Noise
27:24	R/W	0x0	reg_NM_YLPmot_thrd : Luma channel LP portion motion for condition of pixels included in Luma Noise measurement.
23:16	R/W	0x0	reg_NM_YHPmot_thrd_min : Minimum threshold for Luma channel HP portion motion to decide whether the pixel will be included in Luma noise measurement.
15:8	R/W	0x0	reg_NM_YHPmot_thrd_max : Maximum threshold for Luma channel HP portion motion to decide whether the pixel will be included in Luma noise measurement.
7:0	R/W	0x0	reg_NM_Ylock_rate : Rate to decide whether the Luma noise measurement is lock or not.

**NR2\_MET\_NM\_CCTRL 0x1747**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0x0	reg_NM_CPLL_target : Target rate of NM_Cnoise_thrd to mean of the Chroma Noise
27:24	R/W	0x0	reg_NM_CLPmot_thrd : Chroma channel LP portion motion for condition of pixels included in Chroma Noise measurement.
23:16	R/W	0x0	reg_NM_CHPmot_thrd_min : Minimum threshold for Chroma channel HP portion motion to decide whether the pixel will be included in Chroma noise measurement.
15:8	R/W	0x0	reg_NM_CHPmot_thrd_max : Maximum threshold for Chroma channel HP portion motion to decide whether the pixel will be included in Chroma noise measurement.
7:0	R/W	0x0	reg_NM_Clock_rate : Rate to decide whether the Chroma noise measurement is lock or not;

**NR2\_MET\_NM\_TNR 0x1748**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
25	R.O	0x0	ro_NM_TNR_Ylock : Read-only register to tell ifLuma channel noise measurement is locked or not.
24	R.O	0x0	ro_NM_TNR_Clock : Read-only register to tell if Chroma channel noise measurement is locked or not.
23:12	R.O	0x0	ro_NM_TNR_Ylevel : Read-only register to give Luma channel noise level. It was 16x of pixel difference in 8 bits of YHPmot.

Bit(s)	R/W	Default	Description
11:0	R.O	0x0	ro_NM_TNR_Clevel : Read-only register to give Chroma channel noise level. It was 16x of pixel difference in 8 bits of CHPmot.

**NR2\_MET\_NMFRM\_TNR\_YLEV 0x1749**

Bit(s)	R/W	Default	Description
28:0	R.O	0x0	ro_NMFRM_TNR_Ylevel : Frame based Read-only register to give Luma channel noise level within one frame/field.

**NR2\_MET\_NMFRM\_TNR\_YCNT 0x174a**

Bit(s)	R/W	Default	Description
23:0	R.O	0x0	ro_NMFRM_TNR_Ycount : Number of Luma channel pixels included in Frame/Field based noise level measurement.

**NR2\_MET\_NMFRM\_TNR\_CLEV 0x174b**

Bit(s)	R/W	Default	Description
28:0	R.O	0x0	ro_NMFRM_TNR_Clevel : Frame based Read-only register to give Chroma channel noise level within one frame/field.

**NR2\_MET\_NMFRM\_TNR\_CCNT 0x174c**

Bit(s)	R/W	Default	Description
23:0	R.O	0x0	ro_NMFRM_TNR_Ccount : Number of Chroma channel pixels included in Frame/Field based noise level measurement.

**NR2\_3DEN\_MODE 0x174d**

Bit(s)	R/W	Default	Description
6:4	R/W	0x0	Blend_3dnr_en_r :
2:0	R/W	0x0	Blend_3dnr_en_l :

**NR2\_IIR\_CTRL 0x174e**

Bit(s)	R/W	Default	Description
15:14	R/W	0x0	reg_LP_IIR_8bit_mode : LP IIR membitwidth mode:0: 10bits will be store in memory;1: 9bits will be store in memory; 2 : 8bits will be store in memory;3: 7bits will be store in memory;
13:12	R/W	0x0	reg_LP_IIR_mute_mode : Mode for the LP IIR mute,
11:8	R/W	0x0	reg_LP_IIR_mute_thrd : Threshold of LP IIR mute to avoid ghost:
7:6	R/W	0x0	reg_HP_IIR_8bit_mode : IIR membitwidth mode:0: 10bits will be store in memory;1: 9bits will be store in memory; 2 : 8bits will be store in memory;3: 7bits will be store in memory;
5:4	R/W	0x0	reg_HP_IIR_mute_mode : Mode for the HP IIR mute
3:0	R/W	0x0	reg_HP_IIR_mute_thrd : Threshold of HP IIR mute to avoid ghost

**NR2\_SNR\_SAD\_CFG 0x1751**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12	R/W	0x1	reg_MATNR_SNR_SAD_CenRPL : U1, Enable signal for Current pixel position SAD to be replaced by SAD_min.0: do not replace Current pixel position SAD by SAD_min;1: do replacements
11:8	R/W	0x3	reg_MATNR_SNR_SAD_coring : Coring value of the intra-frame SAD. sum = (sum - reg_MATNR_SNR_SAD_coring);sum = (sum<0) ? 0: (sum>255)? 255: sum;
6:5	R/W	0x1	reg_MATNR_SNR_SAD_WinMod : Unsigned, Intra-frame SAD matching window mode:0: 1x1; 1: [1 1 1] 2: [1 2 1]; 3: [1 2 2 1];
4:0	R/W	0x1	Sad_coef_num : Sad coeffient

**NR2\_MATNR\_SNR\_OS 0x1752**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
7:4	R/W	0x8	reg_MATNR_SNR_COS : SNR Filter overshoot control margin for UV channel (X2 to u10 scale)
3:0	R/W	0xd	reg_MATNR_SNR_YOS : SNR Filter overshoot control margin for luma channel (X2 to u10 scale)

**NR2\_MATNR\_SNR\_NRM\_CFG 0x1753**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0x40	reg_MATNR_SNR_NRM_ofst : Edge based SNR boosting normalization offset to SAD_max ;
15:8	R/W	0xff	reg_MATNR_SNR_NRM_max : Edge based SNR boosting normalization Max value
7:0	R/W	0x0	reg_MATNR_SNR_NRM_min : Edge based SNR boosting normalization Min value

**NR2\_MATNR\_SNR\_NRM\_GAIN 0x1754**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:8	R/W	0x0	reg_MATNR_SNR_NRM_Cgain : Edge based SNR boosting normalization Gain for Chrm channel (norm 32 as 1)
7:0	R/W	0x20	reg_MATNR_SNR_NRM_Ygain : Edge based SNR boosting normalization Gain for Luma channel (norm 32 as 1)

**NR2\_MATNR\_SNR\_LPF\_CFG 0x1755**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0xc	reg_MATNR_SNRLPF_SADmaxTH : U8, Threshold to SADmax to use TNRLPF to replace SNRLPF. i.e.if (SAD_max<reg_MATNR_SNRLPF_SADmaxTH) SNRLPF_yuv[k] = TNRLPF_yuv[k];
13:11	R/W	0x2	reg_MATNR_SNRLPF_Cmode : LPF based SNR filtering mode on CHRM channel: 0 : gradient LPF [1 1]/2, 1: gradient LPF [2 1 1]/4; 2: gradient LPF [3 3 2]/8; 3: gradient LPF [5 4 4 3]/16; 4 : TNRLPF; 5 : CurLPF3x3_yuv[]; 6: CurLPF3o3_yuv[] 7: CurLPF3x5_yuv[]

10: 8	R/W	0x2	reg_MATNR_SNRLPF_Ymode : LPF based SNR filtering mode on LUMA channel: 0 : gradient LPF //Bit [1 1]/2, 1: gradient LPF [2 1 1]/4; 2: gradient LPF [3 3 2]/8;3: gradient LPF [5 4 4 3]/16; 4 : TNRLPF; 5 : CurLPF3x3_yuv[]; 6: CurLPF3o3_yuv[] 7: CurLPF3x5_yuv[]
7:4	R/W	0x6	reg_MATNR_SNRLPF_SADmin3TH : Offset threshold to SAD_min to Discard SAD_min3 corresponding pixel in LPF SNR filtering. (X8 to u8 scale)
3:0	R/W	0x4	reg_MATNR_SNRLPF_SADmin2TH : Offset threshold to SAD_min to Discard SAD_min2 corresponding pixel in LPF SNR filtering. (X8 to u8 scale)

**NR2\_MATNR\_SNRLPF\_USF\_GAIN 0x1756**

Bit(s)	R/W	Default	Description
15:8	R/W	0x0	reg_MATNR_SNRLPF_USF_Cgain : Un-sharp (HP) compensate back Chrm portion gain, (norm 64 as 1)
7:0	R/W	0x0	reg_MATNR_SNRLPF_USF_Ygain : Un-sharp (HP) compensate back Luma portion gain, (norm 64 as 1)

**NR2\_MATNR\_SNRLPF\_EDGE2B 0x1757**

Bit(s)	R/W	Default	Description
15:8	R/W	0x80	reg_MATNR_SNRLPF_EDGE2B_ofst : U8, Offset for Beta based on Edge.
7:0	R/W	0x10	reg_MATNR_SNRLPF_EDGE2B_beta_gain : U8. Gain to SAD_min for Beta based on Edge. (norm 16 as 1)

**NR2\_MATNR\_BETA\_EGAIN 0x1758**

Bit(s)	R/W	Default	Description
15:8	R/W	0x20	reg_MATNR_BETA_EGAIN : U8, Gain to Edge based Beta for Chrm channel. (normalized to 32 as 1)
7:0	R/W	0x20	reg_MATNR_BETA_EGAIN : U8, Gain to Edge based Beta for Luma channel. (normalized to 32 as 1)

**NR2\_MATNR\_BETA\_BRT 0x1759**

Bit(s)	R/W	Default	Description
31:28	R/W	0x0	reg_MATNR_BETA_BRT_limit_hi : U4, Beta adjustment based on Brightness high side Limit. (X16 to u8 scale)
27:24	R/W	0x0	reg_MATNR_BETA_BRT_slop_hi : U4, Beta adjustment based on Brightness high side slope. Normalized to 16 as 1
23:16	R/W	0xa0	reg_MATNR_BETA_BRT_thrd_hi : U8, Beta adjustment based on Brightness high threshold.(u8 scale)
15:12	R/W	0x6	reg_MATNR_BETA_BRT_limit_lo : U4, Beta adjustment based on Brightness low side Limit. (X16 to u8 scale)

11:8	R/W	0x6	reg_MATNR_beta_BRT_slop_lo : U4, Beta adjustment based on Brightness low side slope. Normalized to 16 as 1
7:0	R/W	0x64	reg_MATNR_beta_BRT_thrd_lo : U8, Beta adjustment based on Brightness low threshold.(u8 scale)

**NR2\_MATNR\_XBETA\_CFG 0x175a**

Bit(s)	R/W	Default	Description
19:18	R/W	0x0	reg_MATNR_CBeta_use_mode : U2, Beta options (mux) from beta_motion and beta_edge for Chrm channel;
17:16	R/W	0x0	reg_MATNR_YBeta_use_mode : U2, Beta options (mux) from beta_motion and beta_edge for Luma channel;
15: 8	R/W	0x0	reg_MATNR_CBeta_Ofst : U8, Offset to Beta for Chrm channel.(after beta_edge and beta_motion mux)
7: 0	R/W	0x0	reg_MATNR_YBeta_Ofst : U8, Offset to Beta for Luma channel.(after beta_edge and beta_motion mux)

**NR2\_MATNR\_YBETA\_SCL 0x175b**

Bit(s)	R/W	Default	Description
31:24	R/W	0x3c	reg_MATNR_YBeta_scale_min : U8, Final step Beta scale low limit for Luma channel;
23:16	R/W	0xff	reg_MATNR_YBeta_scale_max : U8, Final step Beta scale high limit for Luma channel;
15: 8	R/W	0x20	reg_MATNR_YBeta_scale_gain : U8, Final step Beta scale Gain for Luma channel (normalized 32 to 1);
7 : 0	R/W	0x0	reg_MATNR_YBeta_scale_ofst : S8, Final step Beta scale offset for Luma channel ;

**NR2\_MATNR\_CBETA\_SCL 0x175c**

Bit(s)	R/W	Default	Description
31:24	R/W	0x0	reg_MATNR_CBeta_scale_min : Final step Beta scale low limit for Chrm channel.Similar to Y
23:16	R/W	0xff	reg_MATNR_CBeta_scale_max : U8, Final step Beta scale high limit for Chrm channel.Similar to Y
15: 8	R/W	0x20	reg_MATNR_CBeta_scale_gain : U8, Final step Beta scale Gain for Chrm channel Similar to Y
7: 0	R/W	0x0	reg_MATNR_CBeta_scale_ofst : S8, Final step Beta scale offset for Chrm channel Similar to Y

**NR2\_SNR\_MASK 0x175d**

Bit(s)	R/W	Default	Description
20:0	R/W	0x0	SAD_MSK : Valid signal in the 3x7 SAD surface

**NR2\_SAD2NORM\_LUT0 0x175e**

Bit(s)	R/W	Default	Description

31:24	R/W	0x72	reg_MATNR_SAD2Norm_LUT_3 : SAD convert normal LUT node 3
23:16	R/W	0x92	reg_MATNR_SAD2Norm_LUT_2 : SAD convert normal LUT node 2
15: 8	R/W	0xab	reg_MATNR_SAD2Norm_LUT_1 : SAD convert normal LUT node 1
7: 0	R/W	0xcd	reg_MATNR_SAD2Norm_LUT_0 : SAD convert normal LUT node 0

**NR2\_SAD2NORM\_LUT1 0x175f**

Bit(s)	R/W	Default	Description
31:24	R/W	0x1c	reg_MATNR_SAD2Norm_LUT_7 : SAD convert normal LUT node 7
23:16	R/W	0x23	reg_MATNR_SAD2Norm_LUT_6 : SAD convert normal LUT node 6
15: 8	R/W	0x31	reg_MATNR_SAD2Norm_LUT_5 : SAD convert normal LUT node 5
7: 0	R/W	0x4f	reg_MATNR_SAD2Norm_LUT_4 : SAD convert normal LUT node 4

**NR2\_SAD2NORM\_LUT2 0x1760**

Bit(s)	R/W	Default	Description
31:24	R/W	0xf	reg_MATNR_SAD2Norm_LUT_11 : SAD convert normal LUT node 11
23:16	R/W	0x11	reg_MATNR_SAD2Norm_LUT_10 : SAD convert normal LUT node 10
15: 8	R/W	0x13	reg_MATNR_SAD2Norm_LUT_9 : SAD convert normal LUT node 9
7: 0	R/W	0x17	reg_MATNR_SAD2Norm_LUT_8 : SAD convert normal LUT node 8

**NR2\_SAD2NORM\_LUT3 0x1761**

Bit(s)	R/W	Default	Description
31:24	R/W	0x8	reg_MATNR_SAD2Norm_LUT_15 : SAD convert normal LUT node 15
23:16	R/W	0x9	reg_MATNR_SAD2Norm_LUT_14 : SAD convert normal LUT node 14
15: 8	R/W	0xa	reg_MATNR_SAD2Norm_LUT_13 : SAD convert normal LUT node 13
7: 0	R/W	0xc	reg_MATNR_SAD2Norm_LUT_12 : SAD convert normal LUT node 12

**NR2\_EDGE2BETA\_LUT0 0x1762**

Bit(s)	R/W	Default	Description
31:24	R/W	0x80	reg_MATNR_Edge2Beta_LUT_3 : Edge convert beta LUT node 3
23:16	R/W	0xa0	reg_MATNR_Edge2Beta_LUT_2 : Edge convert beta LUT node 2
15: 8	R/W	0xe0	reg_MATNR_Edge2Beta_LUT_1 : Edge convert beta LUT node 1
7: 0	R/W	0xff	reg_MATNR_Edge2Beta_LUT_0 : Edge convert beta LUT node 0

**NR2\_EDGE2BETA\_LUT1 0x1763**

Bit(s)	R/W	Default	Description

31:24	R/W	0x4	reg_MATNR_Edge2Beta_LUT_7 : Edge convert beta LUT node 7
23:16	R/W	0x10	reg_MATNR_Edge2Beta_LUT_6 : Edge convert beta LUT node 6
15: 8	R/W	0x20	reg_MATNR_Edge2Beta_LUT_5 : Edge convert beta LUT node 5
7: 0	R/W	0x50	reg_MATNR_Edge2Beta_LUT_4 : Edge convert beta LUT node 4

**NR2\_EDGE2BETA\_LUT2 0x1a64**

Bit(s)	R/W	Default	Description
31:24	R/W	0x0	reg_MATNR_Edge2Beta_LUT_11 : Edge convert beta LUT node 11
23:16	R/W	0x0	reg_MATNR_Edge2Beta_LUT_10 : Edge convert beta LUT node 10
15: 8	R/W	0x0	reg_MATNR_Edge2Beta_LUT_9 : Edge convert beta LUT node 9
7: 0	R/W	0x2	reg_MATNR_Edge2Beta_LUT_8 : Edge convert beta LUT node 8

**NR2\_EDGE2BETA\_LUT3 0x1765**

Bit(s)	R/W	Default	Description
31:24	R/W	0x0	reg_MATNR_Edge2Beta_LUT_15 : Edge convert beta LUT node 15
23:16	R/W	0x0	reg_MATNR_Edge2Beta_LUT_14 : Edge convert beta LUT node 14
15: 8	R/W	0x0	reg_MATNR_Edge2Beta_LUT_13 : Edge convert beta LUT node 13
7: 0	R/W	0x0	reg_MATNR_Edge2Beta_LUT_12 : Edge convert beta LUT node 12

**NR2\_MOTION2BETA\_LUT0 0x1766**

Bit(s)	R/W	Default	Description
31:24	R/W	0x20	reg_MATNR_Mot2Beta_LUT_3 : Motion convert beta LUT node 3
23:16	R/W	0x10	reg_MATNR_Mot2Beta_LUT_2 : Motion convert beta LUT node 2
15: 8	R/W	0x4	reg_MATNR_Mot2Beta_LUT_1 : Motion convert beta LUT node 1
7: 0	R/W	0x0	reg_MATNR_Mot2Beta_LUT_0 : Motion convert beta LUT node 0

**NR2\_MOTION2BETA\_LUT1 0x1767**

Bit(s)	R/W	Default	Description
31:24	R/W	0xc4	reg_MATNR_Mot2Beta_LUT_7 : Motion convert beta LUT node 7
23:16	R/W	0x80	reg_MATNR_Mot2Beta_LUT_6 : Motion convert beta LUT node 6
15: 8	R/W	0x40	reg_MATNR_Mot2Beta_LUT_5 : Motion convert beta LUT node 5
7: 0	R/W	0x30	reg_MATNR_Mot2Beta_LUT_4 : Motion convert beta LUT node 4

**NR2\_MOTION2BETA\_LUT2 0x1768**

Bit(s)	R/W	Default	Description

31:24	R/W	0xff	reg_MATNR_Mot2Beta_LUT_11 : Motion convert beta LUT node 11
23:16	R/W	0xff	reg_MATNR_Mot2Beta_LUT_10 : Motion convert beta LUT node 10
15: 8	R/W	0xf0	reg_MATNR_Mot2Beta_LUT_9 : Motion convert beta LUT node 9
7: 0	R/W	0xe0	reg_MATNR_Mot2Beta_LUT_8 : Motion convert beta LUT node 8

**NR2\_MOTION2BETA\_LUT3 0x1769**

Bit(s)	R/W	Default	Description
31:24	R/W	0xff	reg_MATNR_Mot2Beta_LUT_15 : Motion convert beta LUT node 15
23:16	R/W	0xff	reg_MATNR_Mot2Beta_LUT_14 : Motion convert beta LUT node 14
15: 8	R/W	0xff	reg_MATNR_Mot2Beta_LUT_13 : Motion convert beta LUT node 13
7: 0	R/W	0xff	reg_MATNR_Mot2Beta_LUT_12 : Motion convert beta LUT node 12

**NR2\_MATNR\_MTN\_CRTL 0x176a**

Bit(s)	R/W	Default	Description
25:24	R/W	0x0	reg_MATNR_Vmtn_use_mode : Motion_yuvV channel motion selection mode:0: Vmot; 1: Ymot/2 + (Umot+Vmot)/4; 2: Ymot/2 + max(Umot,Vmot)/2; 3: max(Ymot,Umot, Vmot)
21:20	R/W	0x0	reg_MATNR_Umtn_use_mode : Motion_yuvU channel motion selection mode:0: Umot; 1: Ymot/2 + (Umot+Vmot)/4; 2: Ymot/2 + max(Umot,Vmot)/2; 3: max(Ymot,Umot, Vmot)
17:16	R/W	0x0	reg_MATNR_Ymtn_use_mode : Motion_yuvLuma channel motion selection mode:0: Ymot, 1: Ymot/2 + (Umot+Vmot)/4; 2: Ymot/2 + max(Umot,Vmot)/2; 3: max(Ymot,Umot, Vmot)
13:12	R/W	0x1	reg_MATNR_mtn_txt_mode : Texture detection mode for adaptive coring of HP motion
9: 8	R/W	0x1	reg_MATNR_mtn_cor_mode : Coring selection mode based on texture detection;
6: 4	R/W	0x8	reg_MATNR_mtn_hpf_mode : video mode of current and previous frame/field for MotHPF_yuv[k] calculation:
2: 0	R/W	0x6	reg_MATNR_mtn_lpf_mode : LPF video mode of current and previous frame/field for MotLPF_yuv[k] calculation:

**NR2\_MATNR\_MTN\_CRTL2 0x176b**

Bit(s)	R/W	Default	Description
18:16	R/W	0x6	reg_MATNR_iir_BS_Ymode : IIR TNR filter Band split filter mode for Luma LPF result generation (Cur and Prev);
15: 8	R/W	0x40	reg_MATNR_mtnb_alpLP_Cgain : Scale of motion_brlhp_uv to motion_brlp_uv, normalized to 32 as 1
7: 0	R/W	0x40	reg_MATNR_mtnb_alpLP_Ygain : Scale of motion_brlhp_y to motion_brlp_y, normalized to 32 as 1

**NR2\_MATNR\_MTN\_COR 0x176c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:12	R/W	0x3	reg_MATNR_mtn_cor_Cofst : Coring Offset for Chroma Motion.
11: 8	R/W	0x3	reg_MATNR_mtn_cor_Cgain : Gain to texture based coring for Chroma Motion. Normalized to 16 as 1
7: 4	R/W	0x3	reg_MATNR_mtn_cor_Yofst : Coring Offset for Luma Motion.
3: 0	R/W	0x3	reg_MATNR_mtn_cor_Ygain : Gain to texture based coring for Luma Motion. Normalized to 16 as 1

**NR2\_MATNR\_MTN\_GAIN 0x176d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x40	reg_MATNR_mtn_hp_Cgain : Gain to MotHPF_yuv[k] Chrm channel for motion calculation, normalized to 64 as 1
23:16	R/W	0x40	reg_MATNR_mtn_hp_Ygain : Gain to MotHPF_yuv[k] Luma channel for motion calculation, normalized to 64 as 1
15: 8	R/W	0x40	reg_MATNR_mtn_lp_Cgain : Gain to MotLPF_yuv[k] Chrm channel for motion calculation, normalized to 32 as 1
7: 0	R/W	0x40	reg_MATNR_mtn_lp_Ygain : Gain to MotLPF_yuv[k] Luma channel for motion calculation, normalized to 32 as 1

**NR2\_MATNR\_DEGHOST 0x176e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30:28	R/W	0	reg_matnr_deghost_mode : // unsigned , default = 0 0:old_deghost; 1:soft_denoise & strong_deghost; 2:strong_denoise & soft_deghost; 3:strong_denoise & strong_deghost
24:20	R/W	4	reg_matnr_deghost_ygain : // unsigned , default = 4
16:12	R/W	4	reg_matnr_deghost_cgain : // unsigned , default = 4
8	R/W	1	reg_matnr_deghost_en : // unsigned , default = 1 0: disable; 1: enable Enable signal for DeGhost function:0: disable; 1: enable
7: 4	R/W	3	reg_matnr_deghost_cos : // unsigned , default = 3 DeGhost Overshoot margin for UV channel, (X2 to u10 scale)
3: 0	R/W	3	reg_matnr_deghost_yos : // unsigned , default = 3 DeGhost Overshoot margin for Luma channel, (X2 to u10 scale)

**NR2\_MATNR\_ALPHALP\_LUT0 0x176f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x40	reg_MATNR_AlphaLP_LUT_3 : Matnr low-pass filter alpha LUT node 3
23:16	R/W	0x80	reg_MATNR_AlphaLP_LUT_2 : Matnr low-pass filter alpha LUT node 2

15: 8	R/W	0x80	reg_MATNR_AlphaLP_LUT_1 : Matnr low-pass filter alpha LUT node 1
7: 0	R/W	0x80	reg_MATNR_AlphaLP_LUT_0 : Matnr low-pass filter alpha LUT node 0

**NR2\_MATNR\_ALPHALP\_LUT1 0x1770**

Bit(s)	R/W	Default	Description
31:24	R/W	0xff	reg_MATNR_AlphaLP_LUT_7 : Matnr low-pass filter alpha LUT node 7
23:16	R/W	0x80	reg_MATNR_AlphaLP_LUT_6 : Matnr low-pass filter alpha LUT node 6
15: 8	R/W	0x50	reg_MATNR_AlphaLP_LUT_5 : Matnr low-pass filter alpha LUT node 5
7: 0	R/W	0x40	reg_MATNR_AlphaLP_LUT_4 : Matnr low-pass filter alpha LUT node 4

**NR2\_MATNR\_ALPHALP\_LUT2 0x1771**

Bit(s)	R/W	Default	Description
31:24	R/W	0xff	reg_MATNR_AlphaLP_LUT_11 : Matnr low-pass filter alpha LUT node 11
23:16	R/W	0xff	reg_MATNR_AlphaLP_LUT_10 : Matnr low-pass filter alpha LUT node 10
15: 8	R/W	0xff	reg_MATNR_AlphaLP_LUT_9 : Matnr low-pass filter alpha LUT node 9
7: 0	R/W	0xff	reg_MATNR_AlphaLP_LUT_8 : Matnr low-pass filter alpha LUT node 8

**NR2\_MATNR\_ALPHALP\_LUT3 0x1772**

Bit(s)	R/W	Default	Description
31:24	R/W	0xff	reg_MATNR_AlphaLP_LUT_15 : Matnr low-pass filter alpha LUT node 15
23:16	R/W	0xff	reg_MATNR_AlphaLP_LUT_14 : Matnr low-pass filter alpha LUT node 14
15: 8	R/W	0xff	reg_MATNR_AlphaLP_LUT_13 : Matnr low-pass filter alpha LUT node 13
7: 0	R/W	0xff	reg_MATNR_AlphaLP_LUT_12 : Matnr low-pass filter alpha LUT node 12

**NR2\_MATNR\_ALPHAHF\_LUT0 0x1773**

Bit(s)	R/W	Default	Description
31:24	R/W	0x40	reg_MATNR_AlphaHP_LUT_3 : Matnr high-pass filter alpha LUT node 3
23:16	R/W	0x80	reg_MATNR_AlphaHP_LUT_2 : Matnr high-pass filter alpha LUT node 2
15: 8	R/W	0x80	reg_MATNR_AlphaHP_LUT_1 : Matnr high-pass filter alpha LUT node 1
7: 0	R/W	0x80	reg_MATNR_AlphaHP_LUT_0 : Matnr high-pass filter alpha LUT node 0

**NR2\_MATNR\_ALPHAHF\_LUT1 0x1774**

Bit(s)	R/W	Default	Description
31:24	R/W	0xff	reg_MATNR_AlphaHP_LUT_7 : Matnr high-pass filter alpha LUT node 7
23:16	R/W	0x80	reg_MATNR_AlphaHP_LUT_6 : Matnr high-pass filter alpha LUT node 6

15: 8	R/W	0x50	reg_MATNR_AlphaHP_LUT_5 : Matnr high-pass filter alpha LUT node 5
7: 0	R/W	0x40	reg_MATNR_AlphaHP_LUT_4 : Matnr high-pass filter alpha LUT node 4

**NR2\_MATNR\_ALPHAHP\_LUT2 0x1775**

Bit(s)	R/W	Default	Description
31:24	R/W	0xff	reg_MATNR_AlphaHP_LUT_11 : Matnr high-pass filter alpha LUT node 11
23:16	R/W	0xff	reg_MATNR_AlphaHP_LUT_10 : Matnr high-pass filter alpha LUT node 10
15: 8	R/W	0xff	reg_MATNR_AlphaHP_LUT_9 : Matnr high-pass filter alpha LUT node 9
7: 0	R/W	0xff	reg_MATNR_AlphaHP_LUT_8 : Matnr high-pass filter alpha LUT node 8

**NR2\_MATNR\_ALPHAHP\_LUT3 0x1776**

Bit(s)	R/W	Default	Description
31:24	R/W	0xff	reg_MATNR_AlphaHP_LUT_15 : Matnr high-pass filter alpha LUT node 15
23:16	R/W	0xff	reg_MATNR_AlphaHP_LUT_14 : Matnr high-pass filter alpha LUT node 14
15: 8	R/W	0xff	reg_MATNR_AlphaHP_LUT_13 : Matnr high-pass filter alpha LUT node 13
7: 0	R/W	0xff	reg_MATNR_AlphaHP_LUT_12 : Matnr high-pass filter alpha LUT node 12

**NR2\_MATNR\_MTNB\_BRT 0x1777**

Bit(s)	R/W	Default	Description
31:28	R/W	0x0	reg_MATNR_mtnb_BRT_limit_hi : Motion adjustment based on Brightness high side Limit. (X16 to u8 scale)
27:24	R/W	0x0	reg_MATNR_mtnb_BRT_slop_hi : Motion adjustment based on Brightness high side slope. Normalized to 16 as 1
23:16	R/W	0xa0	reg_MATNR_mtnb_BRT_thrd_hi : Motion adjustment based on Brightness high threshold.(u8 scale)
15:12	R/W	0x6	reg_MATNR_mtnb_BRT_limit_lo : Motion adjustment based on Brightness low side Limit. (X16 to u8 scale)
11: 8	R/W	0x6	reg_MATNR_mtnb_BRT_slop_lo : Motion adjustment based on Brightness low side slope. Normalized to 16 as 1
7: 0	R/W	0x64	reg_MATNR_mtnb_BRT_thrd_lo : Motion adjustment based on Brightness low threshold.(u8 scale)

DET 3D REG DEFINE BEGIN //// 8 'h80~0x8f

**DET3D\_RO\_SPLT\_HB 0x1780**

Bit(s)	R/W	Default	Description
24	R.O	0x0	RO_Det3D_Split_HB_valid : U1 horizontal LR split border detected valid signal for top half picture

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
20:16	R.O	0x0	RO_Det3D_Split_HB_pxnum : U5 number of pixels included for the LR split position estimation for top half picture
9: 0	R.O	0x0	RO_Det3D_Split_HB_idxX4 : S10 X4: horizontal pixel shifts of LR split position to the (ColMax/2) for top half picture

**DET3D\_RO\_SPLT\_VL 0x1781**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24	R.O	0x0	RO_Det3D_Split_VL_valid : U1 horizontal LR split border detected valid signal for top half picture
20:16	R.O	0x0	RO_Det3D_Split_VL_pxnum : U5 number of pixels included for the LR split position estimation for top half picture
9: 0	R.O	0x0	RO_Det3D_Split_VL_idxX4 : S10 X4: horizontal pixel shifts of LR split position to the (ColMax/2) for top half picture

**DET3D\_RO\_SPLT\_VR 0x1782**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24	R.O	0x0	RO_Det3D_Split_VR_valid : U1 horizontal LR split border detected valid signal for top half picture
20:16	R.O	0x0	RO_Det3D_Split_VR_pxnum : U5 number of pixels included for the LR split position estimation for top half picture

4:0	R.O	0x0	RO_Hedg_TB_sum : Total score of 8x8 Hedg statistics for TB like decision

**DET3D\_RO\_MAT\_VEDG\_LR 0x178b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	R.O	0x0	RO_Vedg_LR_score : Vertical Edge statistics left right decision score for each band (8bands vertically)
7:0	R.O	0x0	RO_Vedg_LR_symtc : Vertical Edge statistics left right pure symmetric for each band (8bands vertically)
4:0	R.O	0x0	RO_Vedg_LR_sum : Total score of 8x8 Vedg statistics for LR like decision

**DET3D\_RO\_MAT\_VEDG\_TB 0x178c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	R.O	0x0	RO_Vedg_TB_score : Vertical Edge statistics Top/Bottom decision score for each band (8bands Horizontally)
7:0	R.O	0x0	RO_Vedg_TB_symtc : Vertical Edge statistics Top/Bottompure symmetric for each band (8bands Horizontally)
4:0	R.O	0x0	RO_Vedg_TB_sum : Total score of 8x8 Vedg statistics for TB like decision

**DET3D\_RO\_MAT\_MOTN\_LR 0x178d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	R.O	0x0	RO_Motn_LR_score : Motion statistics left right decision score for each band (8bands vertically)
7:0	R.O	0x0	RO_Motn_LR_symtc : Motion statistics left right pure symmetric for each band (8bands vertically)
4:0	R.O	0x0	RO_Motn_LR_sum : Total score of 8x8 Motion statistics for LR like decision

**DET3D\_RO\_MAT\_MOTN\_TB 0x178e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	R.O	0x0	RO_Motn_TB_score : Motion statistics Top/Bottom decision score for each band (8bands Horizontally)
7:0	R.O	0x0	RO_Motn_TB_symtc : Motion statistics Top/Bottompure symmetric for each band (8bands Horizontally)
4:0	R.O	0x0	RO_Motn_TB_sum : Total score of 8x8 Motion statistics for TB like decision

**DET3D\_RO\_FRM\_MOTN 0x178f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:0	R.O	0x0	RO_Det3D_Frame_Motion : U16 frame based motion value sum for still image decision in FW. mat ram read enter addr

**DET3D\_RAMRD\_ADDR\_PORT 0x179a****DET3D\_RAMRD\_DATA\_PORT 0x179b****NR2\_CFR PARA\_CFG0 0x179c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8	R/W	0x0	reg_CFR_CurDif_luma_mode : Current Field Top/Bot line Luma difference calculation mode
7:6	R/W	0x0	reg_MACFR_frm_phase : U2 This will be a field based phase register that need to be set by FW phase to phase: this will be calculated based on dbdr_phase of the specific line of this frame. u1 : dbdr_phase=1, center line is DB in current line; dbdr_phase=2, center line is Dr in current line;
5:4	R/W	0x0	reg_CFR_CurDif_tran_mode : U2 Current Field Top/Bot line Luma/Chroma transition level calculation mode,
3:2	R/W	0x0	reg_CFR_alpha_mode : U2 Alpha selection mode for CFR block from curAlp and motAlp i.e. 0: motAlp; 1: (motAlp+curAlp)/2; 2: min(motAlp,curAlp); 3: max(motAlp,curAlp);
1:0	R/W	0x0	reg_CFR_Motion_Luma_mode : U2 LumaMotion Calculation mode for MA-CFR. 0: top/bot Lumma motion; 1: middle Luma Motion 2: top/bot + middle motion; 3: max(top/tot motion, middle motion)

**NR2\_CFR PARA\_CFG1 0x179d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0x0	reg_CFR_alpha_gain : gain to map muxed curAlp and motAlp to alpha that will be used for final blending.
15: 8	R/W	0x0	reg_CFR_Motion_ofst : Offset to Motion to calculate the motAlp, e,g:motAlp= reg_CFR_Motion_ofst- Motion;This register can be seen as the level of motion that we consider it at moving.
7: 0	R/W	0x0	reg_CFR_CurDif_gain : gain to CurDif to map to alpha, normalized to 32;

**NR3\_MODE 0x2ff0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5	R/W	0x0	reg_3dnr_nr3_vtxt_mode : ;
4	R/W	0x0	reg_3dnr_nr3_cbyy_ignor_coop : ; // u1: ignore coop condition for cbyy motion decision
3	R/W	0x0	reg_3dnr_nr3_ybyc_ignor_cnoop : ; // u1: ignore cnoop condition for ybyc motion decision
2:0	R/W	0x3	reg_3dnr_nr3_suremot_txt_mode : ; // u3: 0: cur, 1:p2; 2: (cur+p2)/2; 3/up: min(cur,p2)

**NR3\_COOP\_PARA 0x2ff1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
21:20	R/W	0x2	reg_3dnr_nr3_coop_mode : ; // u2 0 original pixel 1: [1 2 1]/4 lpf; 2: [1 2 2 1]/8; 3: 3x3 lpf
19:16	R/W	0x8	reg_3dnr_nr3_coop_ratio : ; // u4 cur and p2 color coop decision ratio: (avg1<(MAX(sat0,sat2)*ratio/8 + ofst));
15:8	R/W	0x0	reg_3dnr_nr3_coop_ofset : ; // s8 cur and p2 color coop decision ofst: (avg1<(MAX(sat0,sat2)*ratio/8 + ofst));
7:0	R/W	0x0	reg_3dnr_nr3_coop_sat_thrd : ; // u8 cur and p2 color coop decision min(sat0,sat1) threshold;

**NR3\_CNOOP\_GAIN 0x2ff2**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:20	R/W	0x8	reg_3dnr_nr3_cnoop_ratio0 : ; // u4 cur and p2 color noop decision ratio0: (avg1<(MAX(sat0,sat2)*ratio0/8 + ofst0));

### 10.2.3.9 LBUF Registers

#### LBUF\_TOP\_CTRL 0x2fff

Bit(s)	R/W	Default	Description
25:20	R/W	6'd0	gate clk control of line buf . LBUF_TOP_CTRL[25:24] is the clk control of current line linebuffer. LBUF_TOP_CTRL[23:22] is the clk control of previous one line.linebuffer, LBUF_TOP_CTRL[21:20] is the clk control of previous two line linebuffer.
17	R/W	1'b1	lbuf_fmt444_mode; format of data store in linebuf ,high mean store 444 data into linebuf
16	R/W	1'b1	lbuf_line5_mode;Store 5 line or 3 lines in linebuf ,high means 5 lines
12:0	R/W	13'd342	pre_lbuf_size: size of linebuf

### 10.2.3.10 DI\_SCALE & HDR Registers

#### DI\_SCO\_FIFO\_CTRL 0x374e

Bit(s)	R/W	Default	Description
28:0	R/W	0x0	sco_fifo_ctrl

#### DI\_SC\_TOP\_CTRL 0x374f

Bit(s)	R/W	Default	Description
31	R.O	0	prog_interlace : // unsigned , default = 0x0
30	R/W	0	path_sel : // unsigned , default = 0x0
29	R/W	0	go_field_sel : // unsigned , default = 0x0
28	R/W	0	sw_resets : // unsigned , default = 0x0
27	R/W	0	pps_dummy_data_mode : // unsigned , default = 0x0
26	R/W	0	field_inv : // unsigned , default = 0x0
25	R/W	0	reg_field : // unsigned , default = 0x0
5:4	R/W	0	hdr_gclk_ctrl : // unsigned , default = 0x0
1	R/W	0	reg_gclk_ctrl : // unsigned , default = 0x0

#### DI\_SC\_DUMMY\_DATA 0x3750

Bit(s)	R/W	Default	Description
29:20	R/W	0	VD1_SC_Y : // unsigned , default = 0x10,dummy data used in the VD1 scaler,according VPP_DOLBY_CTRL[17] 1:set 8bit value 2:set 10bit value
19:10	R/W	0	VD1_SC_CB : // unsigned , default = 0x80,dummy data used in the VD1 scaler,according VPP_DOLBY_CTRL[17] 1:set 8bit value 2:set 10bit value
9:0	R/W	0	VD1_SC_CR : // unsigned , default = 0x80,dummy data used in the VD1 scaler,according VPP_DOLBY_CTRL[17] 1:set 8bit value 2:set 10bit value

**DI\_SC\_LINE\_IN\_LENGTH 0x3751**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
13:0	R/W	14	line_in_length : // unsigned , default = 14'd1920,VD1 scaler input hsize

**DI\_SC\_PIC\_IN\_HEIGHT 0x3752**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12:0	R/W	0x1fff	line_in_height : // unsigned , default = 13'h1fff,VD1 scaler input vsize

**DI\_SC\_COEF\_IDX 0x3753**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R/W	0	index_inc : // unsigned , default = 0x0 ,index increment, if bit9 = 1 then (0: index increase 1, 1: index increase 2) else (index increase 2)
14	R/W	0	rd_cbus_coef_en : // unsigned , default = 0x0 ,1: read coef through cbus enable, just for debug purpose in case when we wanna check the coef in ram in correct or not
13	R/W	0	vf_sep_coef_en : // unsigned , default = 0x0 ,if true, vertical separated coef enable
9	R/W	0	high_reso_en : // unsigned , default = 0x0 ,if true, use 9bit resolution coef, other use 8bit resolution coef
8:7	R/W	0	type_index : // unsigned , default = 0x0 ,type of index, 00: vertical coef, 01: vertical chroma coef: 10: horizontal coef, 11: reserved
6:0	R/W	0	coef_index : // unsigned , default = 0x0 ,coef index

**DI\_SC\_COEF 0x3754**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	coef0 : //signed , default = 0x0 , coefficients for vertical filter and horizontal filter
23:16	R/W	0	coef1 : //signed , default = 0x0 , coefficients for vertical filter and horizontal filter
15:8	R/W	0	coef2 : //signed , default = 0x0 , coefficients for vertical filter and horizontal filter
7 :0	R/W	0	coef3 : //signed , default = 0x0 , coefficients for vertical filter and horizontal filter

**DI\_VSC\_REGION12\_STARTP 0x3755**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0	region1_startp : //unsigned , default = 0 ,region1 startp
12:0	R/W	0	region2_startp : //unsigned , default = 0 ,region2 startp

**DI\_VSC\_REGION34\_STARTP 0x3756**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0	region3_startp : //unsigned , default = 0x0438,region3 startp
12:0	R/W	0	region4_startp : //unsigned , default = 0x0438,region4 startp

**DI\_VSC\_REGION4\_ENDP 0x3757**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12:0	R/W	13	region4_endp : //unsigned , default = 13'd1079 ,region4 endp

**DI\_VSC\_START\_PHASE\_STEP 0x3758**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27:24	R/W	1	integer_part : //unsigned , default = 1,vertical start phase step, (source/dest)*(2^24),integer part of step
23:0	R/W	0	fraction_part : //unsigned , default = 0,vertical start phase step, (source/dest)*(2^24),fraction part of step

**DI\_VSC\_REGION0\_PHASE\_SLOPE 0x3759**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region0_phase_slope : //signed , default = 0,vertical scaler region0 phase slope,region0 phase slope

**DI\_VSC\_REGION1\_PHASE\_SLOPE 0x375a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region1_phase_slope : //signed , default = 0,region1 phase slope

**DI\_VSC\_REGION3\_PHASE\_SLOPE 0x375b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region3_phase_slope : //signed , default = 0,region3 phase slope

**DI\_VSC\_REGION4\_PHASE\_SLOPE 0x375c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region4_phase_slope : //signed , default = 0,region4 phase slope

**DI\_VSC\_PHASE\_CTRL 0x375d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18:17	R/W	0	vsc_double_line_mode : //unsigned , default = 0, double line mode, input/output line width of vscale becomes 2X, so only 2 line buffer in this case, use for 3D line by line interleave scaling bit1 true, double the input width and half input height, bit0 true, change line buffer 2 lines instead of 4 lines
16	R.O	0	prog_interlace : //unsigned , default = 0,0: progressive output, 1: interlace output
15	R/W	0	vsc_bot_l0_out_en : //unsigned , default = 0,vertical scaler output line0 in advance or not for bottom field
14:13	R/W	1	vsc_bot_rpt_l0_num : //unsigned , default = 1,vertical scaler initial repeat line0 number for bottom field
11:8	R/W	4	vsc_bot_ini_rcv_num : //unsigned , default = 4,vertical scaler initial receiving number for bottom field
7	R/W	0	vsc_top_l0_out_en : //unsigned , default = 0,vertical scaler output line0 in advance or not for top field
6:5	R/W	1	vsc_top_rpt_l0_num : //unsigned , default = 1,vertical scaler initial repeat line0 number for top field
3:0	R/W	4	vsc_top_ini_rcv_num : //unsigned , default = 4,vertical scaler initial receiving number for top field

**DI\_VSC\_INI\_PHASE 0x375e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	vertical scaler field initial phase for bottom field
15:0	R/W	0	vertical scaler field initial phase for top field

**DI\_HSC\_REGION12\_STARTP 0x3760**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0	region1_startp : //unsigned , default = 0,region1 startp
12:0	R/W	0	region2_startp : //unsigned , default = 0,region2 startp

**DI\_HSC\_REGION34\_STARTP 0x3761**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0	region3 : startp //unsigned , default = 0x780,region3 startp
12:0	R/W	0	region4 : startp //unsigned , default = 0x780,region4 startp

**DI\_HSC\_REGION4\_ENDP 0x3762**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12:0	R/W	13	region4 : startp //unsigned , default = 13'd1919,region4 startp

**DI\_HSC\_START\_PHASE\_STEP 0x3763**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27:24	R/W	1	integer_part : //unsigned , default = 1,integer part of step
23:0	R/W	0	fraction_part : //unsigned , default = 0,fraction part of step

**DI\_HSC\_REGION0\_PHASE\_SLOPE 0x3764**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region0_phase_slope : //signed , default = 0,region0 phase slope

**DI\_HSC\_REGION1\_PHASE\_SLOPE 0x3765**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region0_phase_slope : //signed , default = 0,region1 phase slope

**DI\_HSC\_REGION3\_PHASE\_SLOPE 0x3766**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region0_phase_slope : //signed , default = 0,region3 phase slope

**DI\_HSC\_REGION4\_PHASE\_SLOPE 0x3767**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24:0	R/W	0	region0_phase_slope : //signed , default = 0,region4 phase slope

**DI\_HSC\_PHASE\_CTRL 0x3768**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
22:21	R/W	1	hsc_rpt_p0_num0 : //unsigned , default = 1 ,horizontal scaler initial repeat pixel0 number0
19:16	R/W	4	hsc_ini_rcv_num0 : //unsigned , default = 4 ,horizontal scaler initial receiving number0
15:0	R/W	0	hsc_ini_phase0 : //unsigned , default = 0 ,horizontal scaler top field initial phase0

**DI\_SC\_MISC 0x3769**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
22	R/W	0	hsc_len_div2_en : //unsigned , default = 0 ,if true, divide VSC line length 2 as the HSC input length, otherwise VSC length length is the same as the VSC line length just for special usage, more flexibility
21	R/W	0	lbuf_mode : //unsigned , default = 0 ,if true, prevsc uses lin buffer, otherwise prevsc does not use line buffer, it should be same as prevsc_en
20	R/W	0	prehsc_en : //unsigned , default = 0 ,prehsc_en
19	R/W	0	prevsc_en : //unsigned , default = 0 ,prevsc_en
18	R/W	0	vsc_en : //unsigned , default = 0 ,vsc_en
17	R/W	0	hsc_en : //unsigned , default = 0 ,hsc_en
16	R/W	0	sc_top_en : //unsigned , default = 0 ,scale_top_en
15	R/W	0	sc_vd_en : //unsigned , default = 0 ,video1 scale out enable
12	R/W	1	hsc_nonlinear_4region_en : //unsigned , default = 1 ,if true, region0,region4 are nonlinear regions, otherwise they are not scaling regions, for horizontal scaler
10:8	R/W	0	hsc_bank_length : //unsigned , default = 0 ,horizontal scaler bank length
5	R/W	4	vsc_phase_field_mode : //unsigned , default = 4 ,vertical scaler phase field mode, if true, disable the opposite parity line output, more bandwith needed if output 1080i
4	R/W	0	vsc_nonlinear_4region_en : //unsigned , default = 0 ,if true, region0,region4 are nonlinear regions, otherwise they are not scaling regions, for vertical scaler

3:1	R/W	3	reg_dnr_dm_cordifshft
0	R/W	1	reg_dnr_dm_cordifmod , 0: use max dir dif as cordif, 1: use max3x3-min3x3 as cordif

**DNR\_DM\_FLT\_THD 0x2d66**

Bit(s)	R/W	Default	Description
31:24	R/W	4	reg_dnr_dm_fltthd00 , block flat threshold0 for block average difference when gbs is small
23:16	R/W	6	reg_dnr_dm_fltthd01 , block flat threshold1 for block average difference when gbs is small
15: 8	R/W	9	reg_dnr_dm_fltthd10 , block flat threshold0 for block average difference when gbs is larger
7: 0	R/W	12	reg_dnr_dm_fltthd11 , block flat threshold1 for block average difference when gbs is larger

**DNR\_DM\_VAR\_THD 0x2d67**

Bit(s)	R/W	Default	Description
31:24	R/W	2	reg_dnr_dm_varthd00 , block variance threshold0 ( $\geq$ ) when gbs is small
23:16	R/W	15	reg_dnr_dm_varthd01 , block variance threshold1 ( $\leq$ ) when gbs is small
15: 8	R/W	3	reg_dnr_dm_varthd10 , block variance threshold0 ( $\geq$ ) when gbs is larger
7: 0	R/W	24	reg_dnr_dm_varthd11 , block variance threshold1 ( $\leq$ ) when gbs is larger

**DNR\_DM\_EDGE\_DIF\_THD 0x2d68**

Bit(s)	R/W	Default	Description
31:24	R/W	32	reg_dnr_dm_edgethd0 , block edge threshold ( $\leq$ ) when gbs is small
23:16	R/W	48	reg_dnr_dm_edgethd1 , block edge threshold ( $\leq$ ) when gbs is larger
15: 8	R/W	48	reg_dnr_dm_difthd0 , block dif threshold ( $\leq$ ) when gbs is small
7: 0	R/W	64	reg_dnr_dm_difthd1 , block dif threshold ( $\leq$ ) when gbs is larger

**DNR\_DM\_AVG THD 0x2d69**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W		reserved
15: 8	R/W	160	reg_dnr_dm_avgthd0 , block average threshold (>=) when gbs is small
7: 0	R/W	128	reg_dnr_dm_avgthd1 , block average threshold (<=) when gbs is larger

**DNR\_DM\_AVG\_VAR\_DIF\_THD 0x2d6a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W		reserved
15: 8	R/W	12	reg_dnr_dm_avgdifthd , block average dif threshold(<) between cur and up block for flat block
7: 0	R/W	1	reg_dnr_dm_vardifthd , block variance dif threshold(>=) between cur and up block

**DNR\_DM\_EDGE\_DIF\_THD2 0x2d6b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W		reserved
23:16	R/W	24	reg_dnr_dm_varthd2 , block variance threshold (>=) for edge block detect
15: 8	R/W	40	reg_dnr_dm_edgethd2 , block edge threshold (>=)
7: 0	R/W	80	reg_dnr_dm_difthd2 , block dif threshold (>=)

**DNR\_DM\_DIF\_FLT\_MISC 0x2d6c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	reg_dnr_dm_ldifoob, pre-defined large dif when pixel out of block
27:24	R/W	0	reg_dnr_dm_bdifoob, pre-defined block dif when pixel out of block
23:16	R/W	200	reg_dnr_dm_fltalp, pre-defined alpha for dm and nr blending when block is flat with mos
15:12	R/W		reserved
11:8	R/W	12	reg_dnr_dm_fltminbdif, pre-defined min block dif for dm filter when block is flat with mos
7	R/W		reserved
6:2	R/W	16	reg_dnr_dm_difnormgain, gain for pixel dif normalization for dm filter.
1	R/W	1	reg_dnr_dm_difnormen , enable pixel dif normalization for dm filter
0	R/W	0	reg_dnr_dm_difupden , enable block dif update using max of left,cur,right difs

**DNR\_DM\_SDIF\_LUT0\_2 0x2d6d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

**10.2.3.17 VD1 Path vd\_rmem\_if0 Registers****VD1\_IF0\_GEN\_REG 0x3200**

Bit(s)	R/W	Default	Description
31	R/W	0	ENABLE_FREE_CLK. 0: Gated clock for power saving 1: Free-running clock to drive logic
30	R/W	0	SW_RESET: Write 1 to this bit to generate a pulse to reset everything except registers.
29	R/W	0	RESET_ON_GO_FIELD: Define whether to reset state machines on go_field pulse. 0: No reset on go_field 1: go_field reset everything except registers
28	R/W	0	URGENT_CHROMA: Set urgent level for chroma fifo request from DDR. 0: Non urgent 1: Urgent
27	R/W	0	URGENT_LUMA: Set urgent level for luma fifo request from DDR. 0: Non urgent 1: Urgent

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26	R/W	0	Chroma_end_at_last_line: For chroma line, similar to luma_end_at_last_line, as below. Not used if data are stored together in one canvas.
25	R/W	0	Luma_end_at_last_line: Control whether continue outputting luma line past last line. 0: Repeat the last line or dummy pixels, after past the last line 1: Stop outputting data, once past the last line.
24-19	R/W	4	Hold_lines: After go_field, the number of lines to hold before the module is enabled.
18	R/W	0	LAST_LINE: This bit controls whether we simply repeat the last line or we push dummy pixels. '1' tells the state-machines to repeat the last line using the dummy pixels defined in the register below. '0' indicates that the state-machine should re-read the last line of real data.
17	R	0	Busy status of the state-machines. '1' = busy, '0' = idle
16	R/W	0	DEMUX_MODE: 0 = 4:2:2, 1 = RGB (24-bit). This value is used to control the demuxing logic when the picture is stored together. When a picture is stored together, the data is read into a single FIFO (the Y FIFO) and must be demultiplexed into the "drain" outputs. In the case of 4:2:2 the data is assumed to be stored in memory in 16-bit chunks: <YCb><YCr><YCb><YCr>,... the Y, Cb and Cr 8-bit values are pulled from the single Y-FIFO and sent out in pairs.  This value is only valid when the picture is stored together. If the picture is separated into different canvases, then this bit field is ignored.
15-14	R/W	0	BYTES_PER_PIXEL: This value is used to determine how many bytes are associated with each pixel.  0: This value should be used if the image is stored separately (e.g. RGB or Y, Cb, Cr). 1: This value should be used if the data is 4:2:2 data stored together. In this case each pixel, YCb or YCr, is 16-bits (two bytes). 2: This value should be used if the RGB (24-bit) data is stored together. 3: reserved for future use (alpha RGB).
13-12	R/W	0	DDR_BURST_SIZE_CR: This value is used to control the DDR burst request size for the Cr FIFO.  0: Maximum burst = 24 64-bit values 1: Maximum burst = 32 64-bit values 2: Maximum burst = 48 64-bit values 3: Maximum burst = 64 64-bit values
11-10	R/W	0	DDR_BURST_SIZE_CB: This value is used to control the DDR burst request size for the Cb FIFO.  0: Maximum burst = 24 64-bit values 1: Maximum burst = 32 64-bit values 2: Maximum burst = 48 64-bit values 3: Maximum burst = 64 64-bit values

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
9-8	R/W	0	<p>DDR_BURST_SIZE_Y: This value is used to control the DDR burst request size for the Y FIFO.</p> <p>0: Maximum burst = 24 64-bit values      1: Maximum burst = 32 64-bit values      2: Maximum burst = 48 64-bit values      3: Maximum burst = 64 64-bit values</p>
7	R/W	0	MANUAL_START_FRAME: non-latching bit that can be used to simulate the go_field signal for simulation.
6	R/W	0	CHRO_RPT_LASTL_CTRL: This bit controls whether to allow VPP's chroma-repeat request. <p>0: Chroma-repeat pulses from VPP are ignored      1: Chroma-repeat pulses from VPP are used.</p>
5	R/W	0	Unused
4	R/W	0	LITTLE_ENDIAN: This bit defines the endianess of the memory data . <p>0: Pixel data are stored big-endian in memory      1: Pixel data are stored little-endian in memory</p>
3	R/W	0	Chroma_hz_avg: For chroma line output control, similar to luma_hz_avg, as below. Not used if data are stored together in one canvas.
2	R/W	0	<p>Luma_hz_avg: Enable output half amount of data per line to save bandwidth.</p> <p>0: Output every pixel per line      1: Output half line, each data averaged between every 2 pixels</p> <p>Note: For 4:2:2 mode data stored together in one canvas, only do averaging over luma data.</p>
1	R/W	0	SEPARATE_EN: Set this bit to 1 if the image is in separate canvas locations.
0	R/W	0	ENABLE: This bit is set to 1 to enable the FIFOs and other logic. This bit can be set to 0 to cleanup and put the logic into an IDLE state.

**VD1\_IF0\_CANVAS0 – Picture 0 0x3201**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	unused
23-16	R/W	0	CANVAS0_ADDR2: Canvas table address for picture 0 for component 2 (Cr FIFO). This value is ignored when the picture is stored together
15-8	R/W	0	CANVAS0_ADDR1: Canvas table address for picture 0 for component 1 (Cb FIFO). This value is ignored when the picture is stored together
7-0	R/W	0	CANVAS0_ADDR0: Canvas table address for picture 0 for component 0 (Y FIFO).

3-0	0	See pattern definition above.

**VD1\_IF0\_CHROMA0\_RPT\_PAT – Picture 0 CHROMA repeat pattern 0x320D**

Bit(s)	R/W	Default	Description
31-0	R/W	0	Chroma repeat/skip pattern for picture 0. See picture 0 luma pattern for description. This value is only used when the picture is not stored together.

**VD1\_IF0\_LUMA1\_RPT\_PAT – Picture 1 LUMA repeat pattern 0x320E**

Bit(s)	R/W	Default	Description
31-0	R/W	0	Luma repeat/skip pattern for picture 1. See picture 0 luma pattern for description.

**VD1\_IF0\_CHROMA1\_RPT\_PAT – Picture 1 CHROMA repeat pattern 0x320F**

Bit(s)	R/W	Default	Description
31-0	R/W	0	Chroma repeat/skip pattern for picture 1. See picture 0 luma pattern for description. This value is only used when the picture is not stored together.

**VD1\_IF0\_LUMA\_PSEL – Picture 0 and 1's LUMA 0x3210**

Bit(s)	R/W	Default	Description
31-28	R/W	0	unused
27-26	R/W	0	Luma_psel_mode: controls whether it's single-picture or two-picture mode. {00} Only picture 0 is used. Ignore settings defined in Luma_psel_last_line, Luma_psel_pattern and Luma_psel_loop. {01} Only picture 1 is used. Ignore settings defined in Luma_psel_last_line, Luma_psel_pattern and Luma_psel_loop. {1x} Two-picture mode.
25-24	R/W	0	Luma_psel_last_line: select which picture's last line to output, during repeat last line mode. Bit[0]=0, when picture 0 past the last line, use picture 0's last line during repeat last line mode; Bit[0]=1, when picture 0 past the last line, use picture 1's last line during repeat last line mode; Bit[1]=0, when picture 1 past the last line, use picture 0's last line during repeat last line mode; Bit[1]=1, when picture 1 past the last line, use picture 1's last line during repeat last line mode.
23-8	R/W	0	Luma_psel_pattern. If the value of the bit pointed by the loop pointer is 0, output picture 0's luma line, if the bit value is 1, output picture 1's luma line.
7-4	R/W	0	Luma_psel_loop start pointer.
3-0	R/W	0	Luma_psel_loop end pointer.

**VD1\_IF0\_CHROMA\_PSEL – Picture 0 and 1's CHROMA 0x3211**

Bit(s)	R/W	Default	Description
31-28	R/W	0	unused

27-26	R/W	0	Chroma_psel_mode: see luma_psel_mode. This value is only used when the picture is not stored together.
25-24	R/W	0	Chroma_psel_last_line: See luma_psel_last_line. This value is only used when the picture is not stored together.
23-8	R/W	0	Chroma_psel_pattern. If the value of the bit pointed by the loop pointer is 0, output picture 0's chroma line, if the bit value is 1, output picture 1's chroma line. This value is only used when the picture is not stored together.
7-4	R/W	0	Chroma_psel_loop start pointer. This value is only used when the picture is not stored together.
3-0	R/W	0	Chroma_psel_loop end pointer. This value is only used when the picture is not stored together.

**VD1\_IF0\_DUMMY\_PIXEL 0x3212**

Bit(s)	R/W	Default	Description
31-24	R/W	0x00	Y or R dummy pixel value ,8bit
23-16	R/W	0x80	Cb or G dummy pixel value ,8bit
15-8	R/W	0x80	Cr or B dummy pixel value ,8bit
7-0	R/W	0	unused

**VD1\_RANGE\_MAP\_Y 0x321A****VD1\_RANGE\_MAP\_CB 0x321B****VD1\_RANGE\_MAP\_CR 0x321C**

Output data range conversion function:

$$Y[n] = \text{clip}(\text{Round}((Y[n]+DIN\_OFFSET) * \text{RANGE\_MAP\_COEF}) / (1<\text{RANGE\_MAP\_SR})) + DOUT\_OFFSET;$$

To perform VC-1 range reduction, set the following:

$$\text{DIN\_OFFSET} = 0x180 = -128;$$

$$\text{RANGE\_MAP\_COEF} = \text{RANGE\_MAP\_Y} + 9$$

$$\text{RANGE\_MAP\_SR} = 3$$

$$\text{DOUT\_OFFSET} = 0x080 = 128$$

To get the equivalent function:

$$Y[n] = \text{clip}(((Y[n]-128) * (\text{RANGE\_MAP\_Y} + 9) + 4) >> 3) + 128;$$

Bit(s)	R/W	Default	Description
31-23	R/W	0	DIN_OFFSET
22-15	R/W	0	RANGE_MAP_COEF
14	R/W	0	unused
13-10	R/W	0	RANGE_MAP_SR
9-1	R/W	0	DOUT_OFFSET

0	R/W	0	RANGE_MAP_EN
---	-----	---	--------------

**VD1\_IF0\_GEN\_REG2 0x321D**

Bit(s)	R/W	Default	Description
31-2	R/W	0	unused
1-0	R/W	0	COLOR_MAP: Define color map for NV12 or NV21 mode. Only applicable when VD1_IF0_GEN_REG.SEPARATE_EN = 1. 0: NOT NV12 or NV21; 1: NV12 (CbCr); 2: NV21 (CrCb).

**VD1\_IF0\_GEN\_REG3 0x3216**

Bit(s)	R/W	Default	Description
11-10	R/W	0	cntl_dbg_mode
9-8	R/W	0	cntl_bits_mode : 0->8bit 1->10bit 422 2->10bit 444

28:16	R/W	0x1e0	bld_din0_v_end : //unsigned , default = 13'h1e0,blend_din0 v_end
12:0	R/W	0x0	bld_din0_v_start : //unsigned , default = 13'h0,blend_din0 v_start

**VIU OSD\_BLEND\_DIN1\_SCOPE\_H 0x37b3**

Bit(s)	R/W	Default	Description
28:16	R/W	0x2d0	bld_din1_h_end : //unsigned , default = 13'h2d0
12:0	R/W	0x0	bld_din1_h_start : //unsigned , default = 13'h0

**VIU OSD\_BLEND\_DIN1\_SCOPE\_V 0x37b4**

Bit(s)	R/W	Default	Description
28:16	R/W	0x1e0	bld_din1_v_end : //unsigned , default = 13'h1e0
12:0	R/W	0x0	bld_din1_v_start : //unsigned , default = 13'h0

**VIU OSD\_BLEND\_DIN2\_SCOPE\_H 0x37b5**

Bit(s)	R/W	Default	Description
28:16	R/W	0x2d0	bld_din2_h_end : //unsigned , default = 13'h2d0
12:0	R/W	0x0	bld_din2_h_start : //unsigned , default = 13'h0

**VIU OSD\_BLEND\_DIN2\_SCOPE\_V 0x37b6**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0x1e0	bld_din2_v_end : //unsigned , default = 13'h1e0
12:0	R/W	0x0	bld_din2_v_start : //unsigned , default = 13'h0

**VIU OSD\_BLEND\_DIN3\_SCOPE\_H 0x37b7**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0x2d0	bld_din3_h_end : //unsigned , default = 13'h2d0
12:0	R/W	0x0	bld_din3_h_start : //unsigned , default = 13'h0

**VIU OSD\_BLEND\_DIN3\_SCOPE\_V 0x37b8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0x1e0	bld_din3_v_end : //unsigned , default = 13'h1e0
12:0	R/W	0x0	bld_din3_v_start : //unsigned , default = 13'h0

**VIU OSD\_BLEND\_DUMMY\_DATA0 0x37b9**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0x00	blend0_dummy_data_y : //unsigned , default = 0x00
15:8	R/W	0x80	blend0_dummy_data_cb : //unsigned , default = 0x80
7:0	R/W	0x80	blend0_dummy_data_cr : //unsigned , default = 0x80

**VIU OSD\_BLEND\_DUMMY\_ALPHA 0x37ba**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:20	R/W	0x0	blend0_dummy_alpha : //unsigned , default = 9'h0
19:11	R/W	0x0	blend1_dummy_alpha : //unsigned , default = 9'h0
8:0	R/W	0x0	blend2_dummy_alpha : //unsigned , default = 9'h0

**VIU OSD\_BLEND\_BLEND0\_SIZE 0x37bb**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0x1e0	blend0_vsize : //unsigned , default = 13'h1e0,blend0_vsize
12:0	R/W	0x2d0	blend0_hsize : //unsigned , default = 13'h2d0,blend0_hsize

**VIU OSD\_BLEND\_BLEND1\_SIZE 0x37bc**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R/W	0x1e0	blend1_vsize : //unsigned , default = 13'h1e0
12:0	R/W	0x2d0	blend1_hsize : //unsigned , default = 13'h2d0

### 10.2.3.20 Pre/Post blend Registers

#### VPP\_PRE\_BLEND\_CTRL 0x3960

Bit(s)	R/W	Default	Description
27:20	R/W	0x4	hold_lines : //unsigned , default = 0x4,blend work after hold_lines line after go_field
1:0	R/W	0x1	gclk_ctrl : //unsigned , default = 16'h1,gating ctrl

#### VPP\_PRE\_BLEND\_BLEND\_DUMMY\_DATA 0x3961

Bit(s)	R/W	Default	Description
23:16	R/W	0x0	blend0_dummy_data_y : //unsigned , default = 0x0,blend dummy data
15:8	R/W	0x80	blend0_dummy_data_cb : //unsigned , default = 0x80,blend dummy data
7:0	R/W	0x80	blend0_dummy_data_cr : //unsigned , default = 0x80 ,blend dummy data

#### VPP\_PRE\_BLEND\_DUMMY\_ALPHA 0x3962

Bit(s)	R/W	Default	Description
28:20	R/W	0x0	blend0_dummy_alpha : //unsigned , default = 9'h0,blend dummy alpha
19:11	R/W	0x0	blend1_dummy_alpha : //unsigned , default = 9'h0,blend dummy alpha
8:0	R/W	0x0	blend2_dummy_alpha : //unsigned , default = 9'h0,blend dummy alpha

#### VPP\_PRE\_BLEND2\_RO\_CURRENT\_XY 0x3963

Bit(s)	R/W	Default	Description
28:16	R.O	0x0	ro_current_x : //unsigned , default = 32'h0,blend out x point
12:0	R.O	0x0	ro_current_y : //unsigned , default = 32'h0,blend out x point

#### VPP\_POST\_PRE\_BLEND\_CTRL 0x3967

Bit(s)	R/W	Default	Description
27:20	R/W	0x4	hold_lines : //unsigned , default = 0x4,blend work after hold_lines line after go_field
1:0	R/W	0x1	gclk_ctrl : //unsigned , default = 16'h1,gating ctrl

#### VPP\_POST\_BLEND\_BLEND\_DUMMY\_DATA 0x3968

Bit(s)	R/W	Default	Description
23:16	R/W	0x0	blend0_dummy_data_y : //unsigned , default = 0x0,blend dummy data
15:8	R/W	0x80	blend0_dummy_data_cb : //unsigned , default = 0x80,blend dummy data
7:0	R/W	0x80	blend0_dummy_data_cr : //unsigned , default = 0x80 ,blend dummy data

**VPP\_POST-BLEND\_DUMMY\_ALPHA 0x3969**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:20	R/W	0x0	blend0_dummy_alpha : //unsigned , default = 9'h0,blend dummy alpha
19:11	R/W	0x0	blend1_dummy_alpha : //unsigned , default = 9'h0,blend dummy alpha
8:0	R/W	0x0	blend2_dummy_alpha : //unsigned , default = 9'h0,blend dummy alpha

**VPP\_POST\_BLEND2\_RO\_CURRENT\_XY 0x396a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28:16	R.O	0x0	ro_current_x : //unsigned , default = 32'h0,blend out x point
12:0	R.O	0x0	ro_current_y : //unsigned , default = 32'h0,blend out x point

**10.2.3.21 VPU AFBC Registers****AFBC\_ENABLE 0x1ae0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8	R/W	0	dec_enable : unsigned , default = 0
0	R/W	0	frm_start : unsigned , default = 0

**AFBC\_MODE 0x1ae1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0x0	soft_reset : the use as go_field
28	R/W	0x0	Blk_mem_mode : Default = 0, body space save mode when blk_mem_mode ==1
27:26	R/W	0	rev_mode : uns, default = 0 , reverse mode
25:24	R/W	3	mif_urgent : uns, default = 3 , info mif and data mif urgent
22:16	R/W	0x0	hold_line_num :
15:14	R/W	1	burst_len : uns, default = 1, 0: burst1 1:burst2 2:burst4
13:8	R/W	0	compbits_yuv : uns, default = 0 , bit 1:0,: y component bitwidth : 00-8bit 01-9bit 10-10bit bit 3:2,: u component bitwidth : 00-8bit 01-9bit 10-10bit bit 5:4,: v component bitwidth : 00-8bit 01-9bit 10-10bit
7:6	R/W	0	vert_skip_y : uns, default = 0 , luma vert skip mode : 00-y0y1, 01-y0, 10-y1, 11-(y0+y1)/2
5:4	R/W	0	horz_skip_y : uns, default = 0 , luma horz skip mode : 00-y0y1, 01-y0, 10-y1, 11-(y0+y1)/2
3:2	R/W	0	vert_skip_uv : uns, default = 0 , chroma vert skip mode : 00-y0y1, 01-y0, 10-y1, 11-(y0+y1)/2

1:0	R/W	0	horz_skip_uv : uns, default = 0 , chroma horz skip mode : 00-y0y1, 01-y0, 10-y1, 11-(y0+y1)/2
-----	-----	---	--

**AFBC\_SIZE\_IN 0x1ae2**

Bit(s)	R/W	Default	Description
28:16	R/W	1920	hszie_in : uns, default = 1920 , pic horz size in unit: pixel
12:0	R/W	1080	vsize_in : uns, default = 1080 , pic vert size in unit: pixel

**AFBC\_DEC\_DEF\_COLOR 0x1ae3**

Bit(s)	R/W	Default	Description
29:20	R/W	0	def_color_y : uns, default = 0, afbc dec y default setting value
19:10	R/W	0	def_color_u : uns, default = 0, afbc dec u default setting value
9: 0	R/W	0	def_color_v : uns, default = 0, afbc dec v default setting value

**AFBC\_CONV\_CTRL 0x1ae4**

Bit(s)	R/W	Default	Description
11: 0	R/W	256	conv_lbuf_len : uns, default = 256, unit=16 pixel need to set = 2^n

**AFBC\_LBUF\_DEPTH 0x1ae5**

Bit(s)	R/W	Default	Description
27:16	R/W	128	dec_lbuf_depth : uns, default = 128; // unit= 8 pixel
11:0	R/W	128	mif_lbuf_depth : uns, default = 128;

**AFBC\_HEAD\_BADDR 0x1ae6**

Bit(s)	R/W	Default	Description
31:0	R/W	0x0	mif_info_baddr : uns, default = 32'h0;

**AFBC\_BODY\_BADDR 0x1ae7**

Bit(s)	R/W	Default	Description
31:0	R/W	0x0001_0000	mif_data_baddr : uns, default = 32'h0001_0000;

**AFBC\_SIZE\_OUT 0x1ae8**

Bit(s)	R/W	Default	Description
31:29	R/W	0	reserved
28:16	R/W	1920	hszie_out: uns, default = 1920 ; // unit: 1 pixel
15:13	R/W	0	reserved

Bit(s)	R/W	Default	Description
12:0	R/W	1080	Vsize_out : uns, default = 1080 ; // unit: 1 pixel

**AFBC\_OUT\_YSCOPE 0x1ae9**

Bit(s)	R/W	Default	Description
28:16	R/W	0	out_vert_bgn : uns, default = 0 ; // unit: 1 pixel
12:0	R/W	1079	out_vert_end : uns, default = 1079 ; // unit: 1 pixel

**AFBC\_STAT 0x1aea**

Bit(s)	R/W	Default	Description
0	RO	0x0	frm_end_stat : uns, frame end status

**AFBC\_VD\_CFMT\_CTRL 0x1aeb**

Bit(s)	R/W	Default	Description
31	R/W	0x0	it : true, disable clock, otherwise enable clock
30	R/W	0x0	soft : rst bit
28	R/W	0x0	if : true, horizontal formatter use repeating to generate pixel, otherwise use bilinear interpolation
27:24	R/W	0x0	horizontal : formatter initial phase
23	R/W	0x0	horizontal : formatter repeat pixel 0 enable
22:21	R/W	0x0	horizontal : Y/C ratio, 00: 1:1, 01: 2:1, 10: 4:1
20	R/W	0x0	horizontal : formatter enable
19	R/W	0x0	if : true, always use phase0 while vertical formater, meaning always repeat data, no interpolation
18	R/W	0x0	if : true, disable vertical formatter chroma repeat last line
17	R/W	0x0	vertical : formatter dont need repeat line on phase0, 1: enable, 0: disable
16	R/W	0x0	vertical : formatter repeat line 0 enable
15:12	R/W	0x0	vertical : formatter skip line num at the beginning
11:8	R/W	0x0	vertical : formatter initial phase
7:1	R/W	0x0	vertical : formatter phase step (3.4)
0	R/W	0x0	vertical : formatter enable

**AFBC\_VD\_CFMT\_W 0x1aec**

Bit(s)	R/W	Default	Description

27:16	R/W	0x0	horizontal : formatter width
11:0	R/W	0x0	vertical : formatter width

**AFBC\_MIF\_HOR\_SCOPE 0x1aed**

Bit(s)	R/W	Default	Description
25:16	R/W	0	mif_blk_bgn_h : uns, default = 0 ; // unit: 32 pixel/block hor
9: 0	R/W	59	mif_blk_end_h : uns, default = 59 ; // unit: 32 pixel/block hor

**AFBC\_MIF\_VER\_SCOPE 0x1aee**

Bit(s)	R/W	Default	Description
27:16	R/W	0	mif_blk_bgn_v : uns, default = 0 ; // unit: 32 pixel/block ver

### 10.2.3.22 VPP registers

#### VPP\_DUMMY\_DATA 0x1d00

Bit(s)	R/W	Default	Description
29:20	R/W	0	VD1_SC_Y : // unsigned , default = 0x10,dummy data used in the VD1 scaler,according VPP_DOLBY_CTRL[17] 1:set 8bit value 2:set 10bit value
19:10	R/W	0	VD1_SC_CB : // unsigned , default = 0x80,dummy data used in the VD1 scaler,according VPP_DOLBY_CTRL[17] 1:set 8bit value 2:set 10bit value
9:0	R/W	0	VD1_SC_CR : // unsigned , default = 0x80,dummy data used in the VD1 scaler,according VPP_DOLBY_CTRL[17] 1:set 8bit value 2:set 10bit value

#### VPP\_LINE\_IN\_LENGTH 0x1d01

Bit(s)	R/W	Default	Description
13:0	R/W	14	line_in_length : // unsigned , default = 14'd1920,VD1 scaler input hsize

#### VPP\_PIC\_IN\_HEIGHT 0x1d02

Bit(s)	R/W	Default	Description
12:0	R/W	0x1fff	line_in_height : // unsigned , default = 13'h1fff,VD1 scaler input vsize

#### VPP\_PREBLEND\_VD1\_H\_START\_END 0x1d1a

Bit(s)	R/W	Default	Description
28:16	R/W	0	start : //unsigned , default = 0x0000 ,preblend video1 horizontal start
12:0	R/W	0	end : //unsigned , default = 0x077f ,preblend video1 horizontal end

#### VPP\_PREBLEND\_VD1\_V\_START\_END 0x1d1b

Bit(s)	R/W	Default	Description
28:16	R/W	0	start : //unsigned , default = 0x0000 ,preblend video1 vertical start
12:0	R/W	0	end : //unsigned , default = 0x0437 ,preblend video1 vertical end

#### VPP\_POSTBLEND\_VD1\_H\_START\_END 0x1d1c

Bit(s)	R/W	Default	Description
28:16	R/W	0	start : //unsigned , default = 0x0000 ,postblend video1 horizontal start
12:0	R/W	0	end : //unsigned , default = 0x077f ,postblend video1 horizontal end

#### VPP\_POSTBLEND\_VD1\_V\_START\_END 0x1d1d

Bit(s)	R/W	Default	Description
31:29	/	/	/

28:16	R/W	0	//unsigned , default = 0x0000 ,postblend video1 vertical start Bit
15:13	/	/	/
12:0		0x077f	//unsigned , default = 0x077f ,postblend video1 vertical end

**VPP\_BLEND\_VD2\_H\_START\_END 0x1d1e**

Bit(s)	R/W	Default	Description
28:16	R/W	0	start : //unsigned , default = 0x0000 ,preblend/postblend video2 horizontal start
12:0	R/W	0	end : //unsigned , default = 0x077f ,preblend/postblend video2 horizontal end

**VPP\_BLEND\_VD2\_V\_START\_END 0x1d1f**

Bit(s)	R/W	Default	Description
28:16	R/W	0	start : //unsigned , default = 0x0000 ,preblend/postblend video2 vertical start
12:0	R/W	0	end : //unsigned , default = 0x077f ,preblend/postblend video2 vertical end

**VPP\_PREBLEND\_H\_SIZE 0x1d20**

Bit(s)	R/W	Default	Description
29:16	R/W	14	prebld_v_size : //unsigned , default = 14'd1080 ,preblend output vsize
13:0	R/W	14	prebld_h_size : //unsigned , default = 14'd1920 ,preblend output hsize

**VPP\_POSTBLEND\_H\_SIZE 0x1d21**

Bit(s)	R/W	Default	Description
29:16	R/W	14	postbld_v_size : //unsigned , default = 14'd1080 ,postblend output vsize
13:0	R/W	14	postbld_h_size : //unsigned , default = 14'd1920 ,postblend output hsize

**VPP hold lines VPP\_HOLD\_LINES 0x1d22**

Bit(s)	R/W	Default	Description
15:8	R/W	4	prebld_hold_lines : //unsigned , default = 4,preblend hold lines
7:0	R/W	4	postbld_hold_lines : //unsigned , default = 4,postblend hold lines

**VPP\_MISC 0x1d26**

Bit(s)	R/W	Default	Description
29	R/W	0	vpp_vks_en : //unsigned , default = 0 , vkstone enable
28	R/W	0	color_manage_en : //unsigned , default = 0 , color management enable
27	R/W	0	vd2_use_viu2_out_en : //unsigned , default = 0 , if true, vd2 use viu2 output as the input, otherwise use normal vd2 from memory
26:18	R/W	0	vd2 : alpha //unsigned , default = 0 , video 2 prebld/postbld alpha

7	R/W	1	postbld_en : //unsigned , default = 1 , postblend module enable
6	R/W	0	prebld_en : //unsigned , default = 0 , preblend module enable
3	R/W	0	sr4c1_path_sel : //unsigned , default = 0 , choose sr0 position 1:sr0 bettwen dnlp & CM 0:sr0 bettwen position after postblend
2	R/W	0	disable_RST_afifo : //unsigned , default = 0 , if true, disable resetting async fifo every vsync, otherwise every vsync the aync fifo will be reseted.
1	R/W	0	sr4c0_path_sel : //unsigned , default = 0 , choose sr0 position 1:sr0 bettwen prebld & vd1_scale 0:sr0 bettwen position after dnlp

**VPP\_OFIFO\_SIZE 0x1d27**

Bit(s)	R/W	Default	Description
31:20	R/W	0	ofifo_line_lenm1 : //unsigned , default = 0xffff , ofifo line length minus 1
19	R/W	0	vs_ctrl : //unsigned , default = 0 , if true invert input vs
18	R/W	0	hs_ctrl : //unsigned , default = 0 , if true invert input hs
17	R/W	0	force_top_bot_field_en : //unsigned , default = 0 , force top/bottom field, enable
16	R/W	0	fforce_top_bot_field : //unsigned , default = 0 , force top/bottom field, 0: top, 1: bottom
15	R/W	0	force_go_field : //unsigned , default = 0 , force one go_field, one pluse, write only
14	R/W	0	force_go_line : //unsigned , default = 0 , force one go_line, one pluse, write only
13:0	R/W	0	ofifo_size : //unsigned , default = 0x1000 , ofifo size (actually only bit 10:1 is valid), always even number

**VPP\_FIFO\_STATUS 0x1d28**

Bit(s)	R/W	Default	Description
29:25	R.O	0	ro_sco_ff_buf_count : //unsigned , default = 0,current scale out fifo counter
24:14	R.O	0	ro_afifo_count : //unsigned , default = 0,current enc afifo counter
13:1	R.O	0	ro_ofifo_buf_count : //unsigned , default = 0,current vpp line fifo ofifo counter

**VPP\_MATRIX\_PROBE\_COLOR 0x1d5c**

Bit(s)	R/W	Default	Description
31:24	R.O	0	ro_probe_y_l : //unsigned , default = 0,low 8 bits of component 0
23:12	R.O	0	ro_probe_cr : //unsigned , default = 0,component 1
11:0	R.O	0	ro_probe_cb : //unsigned , default = 0,component 2

**VPP\_MATRIX\_PROBE\_COLOR1 0x1dd7**

Bit(s)	R/W	Default	Description
31	R.O	0x0	ro_probe_pix_v : //it means this probe is valid in the last field/frame

3:0	R.O	0	ro_probe_y_h : //unsigned , default = 0,high 4 bits of component 0
-----	-----	---	--

**VPP\_MATRIX\_HL\_COLOR 0x1d5d**

Bit(s)	R/W	Default	Description
23:16	R/W	0	hl_y : //unsigned , default = 0,component 0
15:8	R/W	0	hl_cb : //unsigned , default = 0,component 1
7:0	R/W	0	hl_cr : //unsigned , default = 0,component 2

**VPP\_MATRIX\_PROBE\_POS 0x1d5e**

Bit(s)	R/W	Default	Description
28:16	R.O	0	probe_x : //unsigned , default = 0,probe x, position
12:0	R.O	0	probe_y : //unsigned , default = 0,probe y, position

**VPP\_MATRIX\_CTRL 0x1d5f**

Bit(s)	R/W	Default	Description
16	R/W	0	highlight_en : //unsigned , default = 0, highlight enable
15	R.O	0	probe_post : //unsigned , default = 0, if true, probe pixel data after matrix, otherwise probe pixel data before matrix
10	R.O	0	probel_sel : //unsigned , default = 0, active when VIU_SECURE_REG[9] high, probel sel 0:vadj1 1:vadj2 2:osd2 3:postbid 4:osd1

**VPP\_GAINOFF\_CTRL0 0x1d6a**

Bit(s)	R/W	Default	Description
31	R/W	0	enable : //unsigned , default = 0, gainoff module enable
30	R/W	0	enable_sel : //unsigned , default = 0, gainoff module enable sync sel
26:16	R/W	0	gain0 : //unsigned , default = 0, gainoff module gain0
10:0	R/W	0	gain1 : //unsigned , default = 0, gainoff module gain1

**VPP\_GAINOFF\_CTRL1 0x1d6b**

Bit(s)	R/W	Default	Description
26:16	R/W	0	gain2 : //unsigned , default = 0, gainoff module gain2
12:0	R/W	0	offset0 : //signed , default = 0, gainoff module offset0

**VPP\_GAINOFF\_CTRL2 0x1d6c**

Bit(s)	R/W	Default	Description
28:16	R/W	0	offset1 : //signed , default = 0, gainoff module offset1

12:0	R/W	0	offset2 : //signed , default = 0, gainoff module offset2
------	-----	---	--

**VPP\_GAINOFF\_CTRL3 0x1d6d**

Bit(s)	R/W	Default	Description
28:16	R/W	0	pre_offset0 : //signed , default = 0, gainoff module pre_offset0
12:0	R/W	0	pre_offset1 : //signed , default = 0, gainoff module pre_offset1

**VPP\_GAINOFF\_CTRL4 0x1d6e**

Bit(s)	R/W	Default	Description
12:0	R/W	0	pre_offset2 : //signed , default = 0, gainoff module pre_offset2

**VPP\_GAINOFF\_GCLK\_CTRL 0x1d6f**

Bit(s)	R/W	Default	Description
1:0	R/W	0	gainoff_gclk_ctrl : //unsigned , default = 0,gainoff_gclk_ctrl

**VPP\_GCLK\_CTRL0 0x1d72**

Bit(s)	R/W	Default	Description
5:4	R/W	0	ofifo_clk1 : //unsigned , default = 0,gating clock of out linefifo in vpp
3:2	R/W	0	clk0 : //unsigned , default = 0,clk swtich of all vpp module
1	R/W	0	reg_gclk : //unsigned , default = 0,registers gate clk of vpp module

**VPP\_GCLK\_CTRL1 0x1d73**

Bit(s)	R/W	Default	Description
27:20	R/W	0	gclk_ctrl_wm : //unsigned , default = 0,gating clock of water_mark
18:15	R/W	0	dolby3_gclk_ctrl : //unsigned , default = 0,gating clock of dolby3
3:0	R/W	0	cm_gclk_ctrl : //unsigned , default = 0,gating clock of color manage

**VPP\_MISC1 0x1d76**

Bit(s)	R/W	Default	Description
20:12	R/W	0	vd1_prebl_alpha : //unsigned , default = 0,VD1 alpha for preblend
8:0	R/W	0	vd1_postbl_alpha : //unsigned , default = 0,VD1 alpha for postblend

**VPP\_SRSCl\_GCLK\_CTRL 0x1d77**

Bit(s)	R/W	Default	Description
15:8	R/W	0	gclk_ctrl_sr1 : //unsigned , default = 0 , gating clock of sr1
7:0	R/W	0	gclk_ctrl_sr0 : //unsigned , default = 0 , gating clock of sr0

**VPP\_BLACKEXT\_CTRL 0x1d80**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	blackext_start : //unsigned , default = 0 ,blackext_start
23:16	R/W	0	blackext_slope1 : //unsigned , default = 0 ,blackext_slope1
15:8	R/W	0	blackext_midpt : //unsigned , default = 0 ,blackext_midpt
7:0	R/W	0	blackext_slope2 : //unsigned , default = 0 ,blackext_slope2

**VPP\_DNLP\_CTRL\_00 0x1d81**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	data0 : //unsigned , default = 0 ,bottom of region03 output value

**10.2.3.23 CM registers****VPP\_CHROMA\_ADDR\_PORT 0x1d70**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Color management address port

**VPP\_CHROMA\_DATA\_PORT 0x1d71**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Color management data port

Color management internal registers is indirectly accessed by the registers VPP\_CHROMA\_ADDR\_PORT and VPP\_CHROMA\_DATA\_PORT.

**Color management registers**

The example to access the Color management registers is like this:

Wr(VPP\_CHROMA\_ADDR\_PORT);

Wr(VPP\_CHROMA\_DATA\_PORT);

**REG\_CHROMA\_CONTROL 0x30**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	reg_chroma_en. enable color manage function 1'b1: enable 1'b0: bypass

6	R/W	0	sat_sel. uv_max or $u^2+v^2$ selected as sat for reference 1'b1: uv_max(default) 1'b0: $u^2+v^2$
5	R/W	0	uv_adj_en. final uv_adjust enable 1'b1: enable 1'b0: bypass
2	R/W	0	hue_en. rgb to hue enable 1'b1: enable(default) 1'b0: bypass
1-0	R/W	0	csc_sel. define input YUV with different color type 2'b00: 601(16-235) 2'b01: 709(16-235) 2'b10: 601(0-255) 2'b11: 709(0-255)

**SAT\_BYYB\_NODE0 0x200**

Bit(s)	R/W	Default	Description
31-24	R/W	0	The 4th node, the same as below
23-16	R/W	0	The 3th node, the same as below
15-8	R/W	0	The 2th node, the same as below
7-0	R/W	0	Signed, The 1th node about saturation gain offset along Y coordinate, the gain normalized to 128 as "1".

**SAT\_BYYB\_NODE1 0x201**

Bit(s)	R/W	Default	Description
31-24	R/W	0	The 8th node, the same as below
23-16	R/W	0	The 7th node, the same as below
15-8	R/W	0	The 6th node, the same as below
7-0	R/W	0	Signed, The 5th node about saturation gain offset along Y coordinate, the gain normalized to 128 as "1".

**SAT\_BYYB\_NODE2 0x202**

Bit(s)	R/W	Default	Description
31-8	R/W	0	reserved
7-0	R/W	0	Signed, The 9th node about saturation gain offset along Y coordinate, the gain normalized to 128 as "1".

**SAT\_SRC\_NODE 0x203**

Bit(s)	R/W	Default	Description
31-28	R/W	0	reserved
27-16	R/W	0x800	unsign, Threshold of input saturation for second & third piece. i.e. it is boundary for reg_CM2_Adj_Sat_via_HS[1][:]and reg_CM2_Adj_Sat_via_HS[2][:]

15-12	R/W	0	reserved
11-0	R/W	0x400	unsign, Threshold of input saturation for first and second piece.i.e. it is boundary for reg_CM2_Adj_Sat_via_HS[0][:] and reg_CM2_Adj_Sat_via_HS[1][:]

**CM\_ENH\_SFT\_MODE 0x204**

Bit(s)	R/W	Default	Description
31-9	R/W	0	reserved
8-6	R/W	0	Hue offset adjustments scale for Reg_CM2_Adj_Hue_via_H[:]& Reg_CM2_Adj_Hue_via_S[:]& Reg_CM2_Adj_Hue_via_Y[:]; 0: no scale up; 1: upscale by 2 - (-128,127)x2; 2: upscale by 4 - (-128,127)x4; 3: upscale by 8 - (-128,127)x8;
5-4	R/W	0	Luma offset adjustments scale for reg_CM2_Adj_Luma_via_Hue[i]: 0: no scale up; 1: upscale by2 - (-128,127)x2; 2: upscale by 4 - (-128,127)x4; 3: upscale by 8 - (-128,127)x8;
3-2	R/W	0	Saturation again adjustments scale for reg_CM2_Adj_Sat_via_Y[:][:] &Reg_CM2_Adj_SatGLBgain_via_Y[:]; 0: no scale up/down; 1: dnscale by 2 (-128,127)/2; 2: dnscale by 4 (-128,127)/4; 3: dnscale by 8 (-128,127)/8;
1-0	R/W	0	Saturation again adjustments scale for reg_CM2_Adj_Sat_via_HS[:][:]; 0: no scale up/down; 1: dnscale by 2 (-128,127)/2; 2: dnscale by 4 (-128,127)/4; 3: dnscale by 8 (-128,127)/8;

**FRM\_SIZE 0x205**

Bit(s)	R/W	Default	Description
31-29	R/W	0	reserved
28-16	R/W	0x438	The frame height size
15-13	R/W	0	reserved

12-0	R/W	0x780	The frame width size

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-28	R/W	0	reserved
27-16	R/W	0	Higher bound of luma value for color of interest (COI), 8bits precision
15-12	R/W	0	reserved
11-0	R/W	0	Lower bound of luma value for color of interest (COI), 8bits precision

**COI\_H\_SCOPE 0x20d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-28	R/W	0	reserved
27-16	R/W	0	Higher bound of Hue value for color of interest (COI), 12 8bits precision
15-12	R/W	0	reserved
11-0	R/W	0	Lower bound of Hue value for color of interest (COI), 12 bits precision

**COI\_S\_SCOPE 0x20e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-28	R/W	0	reserved
27-16	R/W	0	Higher bound of Sat value for color of interest (COI), 12 8bits precision
15-12	R/W	0	reserved
11-0	R/W	0	Lower bound of Sat value for color of interest (COI), 12 bits precision

**IFO\_MODE 0x20f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-8	R/W	0	reserved
7-4	R/W	0	Mode control for COI replacement, bit[3:2] control COI pixels: 0: no replacement for COI pixels 1: disable CM2 enhance for COI pixels; 2: keep COI pixels Y but replace HS by [*HS]; 3: replace COI pixels to [*YHS] bit[1:0] controls non-COI pixels: 0: no replacement for non-COI pixels 1: disable CM2 enhance for non-COI pixels; 2: keep COI pixels Y but replace HS by [*HS]; 3: replace non- COI pixels to [*YHS]
3-0	R/W	0	Enhance mode control of pixels inside and outside Region of Interest (ROI) , bit [3:2] control ROI: 0: enable CM2 processing in ROI; 1: disable CM2 processing in ROI; 2: keep ROI pixels Y but replace HS by [*HS]; 3: ow ROI pixels to [*YHS] bit [1:0] control pixels other than ROI similarly. 0: enable CM2 processing in non-ROI; 1: disable CM2 processing in non-ROI; 2: keep ROI pixels Y but replace HS by [*HS]; 3: ow non-ROI pixels to [*YHS]

**POI\_RPL\_MODE0x210**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-4	R/W	0	reserved

3-0	R/W	0	Pixel of interest (POI) replacement mode: 0: no replacements; 1: one pixel of POI position replaced to [*YHS] 2: 3X3 pixels centering POI position replaced to [*YHS] 3: 5X5 pixels centering POI position replaced to [*YHS] ... 15: 29X29 pixels centering POI position replaced to [*YHS]
-----	-----	---	--

**DEMO\_OWR\_YHS 0x211**

Bit(s)	R/W	Default	Description
31-24	R/W	0	Saturation value overwriting to ROI/POI/COI; 12bits precision, equal to saturation precision.
23-12	R/W	0	Hue value overwriting to ROI/POI/COI; 12 bits precision, equal to 1/4 hue precision. E.g. { Reg_CM2Demo_OWR_H, 2'h0}
11-0	R/W	0	Luma value overwriting to ROI/POI/COI; 8bits precision, equal to 1/4 luma precision, e.g. { Reg_CM2Demo_OWR_Y, 2'h0}

**DEMO\_POI\_Y 0x212**

Bit(s)	R/W	Default	Description
31-8	RO	0	Reserved
7-0	RO	0	Luma value for pixel of interest (POI), only get locked higher 8bits

**DEMO\_POI\_H 0x213**

Bit(s)	R/W	Default	Description
31-12	RO	0	Reserved
11-0	RO	0	Hue value for pixel of interest (POI), only get locked higher 12bits

**DEMO\_POI\_S 0x214**

Bit(s)	R/W	Default	Description
31-12	RO	0	Reserved
11-0	RO	0	Saturation value for pixel of interest (POI), only get locked higher 12bits

**LUMA\_ADJ\_LIMIT 0x215**

Bit(s)	R/W	Default	Description
31-28	R/W	0	reserved
27-16	R/W	0	Slope to do the Luma adjust degrade speed based on Saturation. It was normalized to 16 as '1'.

15-12	R/W	0	reserved
11-0	R/W	0	Threshold to saturation to do Luma adjustment degrade. Only pixels' saturation lower than this threshold will degrade the Luma adjustment.

**SAT\_ADJ\_LIMIT 0x216**

Bit(s)	R/W	Default	Description
31-28	R/W	0	reserved
27-16	R/W	0	Slope to do the Sat adjust degrade speed based on Saturation. It was normalized to 16 as '1'.
15-12	R/W	0	reserved
11-0	R/W	0	Threshold to saturation to do Sat adjustment degrade. Only pixels' saturation lower than this threshold will degrade the Luma adjustment.

**HUE\_ADJ\_LIMIT 0x217**

Bit(s)	R/W	Default	Description
31-28	R/W	0	reserved
27-16	R/W	0	Slope to do the Hue adjust degrade speed based on Saturation. It was normalized to 16 as '1'.
15-12	R/W	0	reserved
11-0	R/W	0	Threshold to saturation to do Hue adjustment degrade. Only pixels' saturation lower than this threshold will degrade the Luma adjustment.

**UVHS\_OFST 0x218**

Bit(s)	R/W	Default	Description
31-24	R/W	0	V offset after CM2, under s10 scale
23-16	R/W	0	U offset after CM2, under s10 scale
15-8	R/W	0	V offset before CM2, under s10 scale
7-0	R/W	0	U offset before CM2, under s10 scale.

**HUE\_CFG\_PARA 0x219**

Bit(s)	R/W	Default	Description
31-17	R/W	0	reserved
16	R/W	0	Options to protect HUE after CM2 adjustments. This will be added to avoid HUE distortion if Saturation is enhanced too much.
15-13	R/W	0	Hue adjustment via HS the Saturation division mode: 0: 1024/2048/3072, 4095; 1: 512, 1024, 1536, 2048; 2: 256, 512, 768, 1024;

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			3: 128, 256, 384, 512; 4: 512/1024/2048/4096; 5: 256/512/1024/2048; 6: 128/256/512/1024; 7: 64,128,256,512
12	R/W	0	Hue slice division mode: 0: 32 pieces, 360/32 degrees each slice; 1/up: first 20 slices with 360/64 degrees each slice, others 360/16 degrees each slices. Notes, this option provide options to get more precise Hue adjustments for FTC/Red and so on
11-0	R/W	0	Hue offset before CM2 adjustment, this will provide options to divide the Hue slices with a precise offset. But need to compensate back with the global Hue after CM2 adjsutments

**DEMO\_SPLT\_CFG 0x21a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-22	R/W	0	reserved
21-20	R/W	0	Demo split post
19-16	R/W	0	Demo split width
12-0	R/W	0	Demo split mode

**DEMO\_SPLT\_YHS 0x21b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Luma value
23-12	R/W	0	Hue value
11-0	R/W	0	Sat value

**XVYCC\_YSCP\_REG 0x21c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27:16	R/W	0x3ff	xvycc_y_max
11:0	R/W	0x0	xvycc_y_min

**XVYCC\_USCP\_REG 0x21d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27:16	R/W	0x3ff	xvycc_u_max
11:0	R/W	0x0	xvycc_u_min

**XVYCC\_VSCP\_REG 0x21e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27:16	R/W	0x3ff	xvycc_v_max
11:0	R/W	0x0	xvycc_v_min

the main adjust parameter is saved according to 32 hue node order, one by one. The parameter of each hue node is same. All the parameter for each hue occupy 5 register-addr-space. For the addr-offset aligned, we allocate 8 addr-space to each node parameter, for example,

the parameter of 1th node uses the address space : 0x100, 0x101, 0x102, 0x103, 0x104,

and 2th node uses the address space : 0x108, 0x109, 0x10a, 0x10b, 0x10c,

and 2th node uses the address space : 0x110, 0x111, 0x112, 0x113, 0x114,

**CM2\_ENH\_COEF0\_H00 0x100**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Same as last
23-16	R/W	0	Same as last
15-8	R/W	0	Signed, Saturation gain offset for three pieces saturation on Hue section (totally 32 sections) node 0; the gain normalized to 128 as "1".
7-0	R/W	0	Signed, Luma offsets for Hue section (totally 32 sections) nodes 0 , range (-128,127)

**CM2\_ENH\_COEF1\_H00 0x101**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Signed, Hue offset for each four pieces Luma region on each Hue section (totally 32 sections) nodes, this is for y=2/4, hue node 0
23-16	R/W	0	Signed, Hue offset for each four pieces Luma region on each Hue section (totally 32 sections) nodes, this is for y=1/4, hue node 0
15-8	R/W	0	Signed, Hue offset for each four pieces Luma region on each Hue section (totally 32 sections) nodes, this is for y=0, hue node 0
7-0	R/W	0	Signed, Hue offset on Hue section (totally 32 sections) node 0

**CM2\_ENH\_COEF2\_H00 0x102**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Signed, Hue offset for each four pieces Saturation region on each Hue section (totally 32 sections) nodes; This is for sat = 1/4, hue node 0
23-16	R/W	0	Signed, Hue offset for each four pieces Saturation region on each Hue section (totally 32 sections) nodes; This is for sat = 0, hue node 0
15-8	R/W	0	Signed, Hue offset for each four pieces Luma region on each Hue section (totally 32 sections) nodes, this is for y=4/4, hue node 0

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
7-0	R/W	0	Signed, Hue offset for each four pieces Luma region on each Hue section (totally 32 sections) nodes, this is for y=3/4, hue node 0

**CM2\_ENH\_COEF3\_H00 0x103**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Saturation gain offset for four pieces Luma on each Hue section (totally 32 sections) nodes; the gain normalized to 128 as "1". This is for sat = 0, hue node 0
23-16	R/W	0	Signed, Hue offset for each four pieces Saturation region on each Hue section (totally 32 sections) nodes; This is for sat = 4/4, hue node 0
15-8	R/W	0	Signed, Hue offset for each four pieces Saturation region on each Hue section (totally 32 sections) nodes; This is for sat = 3/4, hue node 0
7-0	R/W	0	Signed, Hue offset for each four pieces Saturation region on each Hue section (totally 32 sections) nodes; This is for sat = 2/4, hue node 0

**CM2\_ENH\_COEF4\_H00 0x104**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	Saturation gain offset for four pieces Luma on each Hue section (totally 32 sections) nodes; the gain normalized to 128 as "1". This is for sat = 4/4, hue node 0
23-16	R/W	0	Saturation gain offset for four pieces Luma on each Hue section (totally 32 sections) nodes; the gain normalized to 128 as "1". This is for sat = 3/4, hue node 0
15-8	R/W	0	Saturation gain offset for four pieces Luma on each Hue section (totally 32 sections) nodes; the gain normalized to 128 as "1". This is for sat = 2/4, hue node 0
7-0	R/W	0	Saturation gain offset for four pieces Luma on each Hue section (totally 32 sections) nodes; the gain normalized to 128 as "1". This is for sat = 1/4, hue node 0

#### 10.2.3.24 VPP OSD1 SCALER

**VPP OSD\_VSC\_PHASE\_STEP** 0x1dc0

Bit(s)	R/W	Default	Description
27-0	R/W	0x01000000	4.24 format

**VPP OSD\_VSC\_INI\_PHASE** 0x1dc1

Bit(s)	R/W	Default	Description
31-16	R/W	0x0	botttom vertical scaler initial phase
15-0	R/W	0x0	top vertical scaler initial phase

**VPP OSD\_VSC\_CTRL0** 0x1dc2

Bit(s)	R/W	Default	Description
24	R/W	0x0	osd vertical Scaler enable
23	R/W	0x0	osd_prog_interlace 0: current field is progressive, 1: current field is interlace
22-21	R/W	0x0	osd_vsc_double_line_mode, bit1, double input width and half input height, bit0, change line buffer becomes 2 lines
20	R/W	0x0	osd_vsc_phase0_always_en
19	R/W	0x0	osd_vsc_nearest_en
17-16	R/W	0x0	osd_vsc_bot_rpt_l0_num
14-11	R/W	0x0	osd_vsc_bot_ini_rcv_num

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
9-8	R/W	0x0	osd_vsc_top_rpt_l0_num
6-3	R/W	0x0	osd_vsc_top_ini_rcv_num
2-0	R/W	0x0	osd_vsc_bank_length

**VPP OSD HSC\_PHASE\_STEP 0x1dc3**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-0	R/W	0x01000000	4.24 format

**VPP OSD HSCINI PHASE 0x1dc4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R/W	0x0	horizontal scaler initial phase1
15-0	R/W	0x0	horizontal scaler initial phase0

**VPP OSD HSC\_CTRL0 0x1dc5**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
22	R/W	0x0	osd horizontal Scaler enable
21	R/W	0x0	osd_hsc_double_pix_mode
20	R/W	0x0	osd_hsc_phase0_always_en
19	R/W	0x0	osd_vsc_nearest_en
17-16	R/W	0x0	osd_hsc_rpt_p0_num1
14-11	R/W	0x0	osd_hsc_ini_rcv_num1
9-8	R/W	0x0	osd_hsc_rpt_p0_num0
6-3	R/W	0x0	osd_hsc_ini_rcv_num0
2-0	R/W	0x0	osd_hsc_bank_length

**VPP OSD HSCINI PAT\_CTRL 0x1dc6**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-8	R/W	0x0	for 3D quincunx sub-sampling. pattern, each patten 1 bit, from lsb -> msb
6-4	R/W	0x0	pattern start
2-0	R/W	0x0	pattern end

**VPP OSD SC\_DUMMY\_DATA 0x1dc7**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0x0	componet 0 ,data = (dst_data >> 4) ,so 8 bit in 12bit mode, 6bit in 10bit mode
23-16	R/W	0x0	component 1 ,data = (dst_data >> 4) ,so 8 bit in 12bit mode, 6bit in 10bit mode
15-8	R/W	0x0	component 2 ,data = (dst_data >> 4) ,so 8 bit in 12bit mode, 6bit in 10bit mode
7-0	R/W	0x0	component 3 , alpha

**VPP OSD SC\_CTRL0 0x1dc8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27:16	R/W	0	osd_sc_gclk_ctrl : //unsigned,default = 0,osd_sc_gclk_ctrl
13	R/W	0	osd_sc_din_osd_alpha_mode : //unsigned,default = 0,osc_sc_din_osd2_alpha_mode, 1: (alpha >= 128) ? alpha -1: alpha, 0: (alpha >=1) ? alpha - 1: alpha.
12	R/W	0	osd_sc_dout_alpha_mode : //unsigned,default = 0,osc_sc_alpha_mode, 1: (alpha >= 128) ? alpha +1: alpha, 0: (alpha >=1) ? alpha + 1: alpha.
11:4	R/W	0	osd_sc_alpha : //unsigned,default = 0,default alpha for vd1 or vd2 if they are selected as the source
3	R/W	0	osd_sc_path_en : //unsigned,default = 0,osd scaler path enable
2	R/W	0	osd_sc_en : //unsigned,default = 0,osd scaler enable

**VPP OSD SCI\_WH\_M1 0x1dc9**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0x0	OSD scaler input width minus 1
12-0	R/W	0x0	OSD scaler input height minus 1

**VPP OSD SCO\_H\_START\_END 0x1dca**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0x0	OSD scaler output horizontal start
11-0	R/W	0x0	OSD scaler output horizontal end

**VPP OSD SCO\_V\_START\_END 0x1dcbb**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0x0	OSD scaler output vertical start
11-0	R/W	0x0	OSD scaler output vertical end

**VPP OSD\_SCALE\_COEF\_IDX 0x1dcc**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

15	R/W	0x0	Because there are many coefficients used in the vertical filter and horizontal filters, //indirect access the coefficients of vertical filter and horizontal filter is used. //For vertical filter, there are 33x4 coefficients //For horizontal filter, there are 33x4 coefficients //Bit 15 index increment, if bit9 == 1 then (0: index increase 1, 1: index increase 2) else (index increase 2)
14	R/W	0x0	1: read coef through cbus enable, just for debug purpose in case when we wanna check the coef in ram in correct or not
9	R/W	0x0	if true, use 9bit resolution coef, other use 8bit resolution coef
8	R/W	0x0	type of index, 0: vertical coef, 1: horizontal coef
6-0	R/W	0x0	coef index

**VPP OSD SCALE COEF 0x1dcd**

Bit(s)	R/W	Default	Description
31-0	R/W	0x0

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

16	R/W	0	reg_vks_en_mode : // unsigned , default = 0
15: 0	R/W	5	reg_hold_phnum : // unsigned , default = 5

**VKS\_LBUF\_SIZE 0x310b**

Bit(s)	R/W	Default	Description
11: 0	R/W	1024	reg_lbuf_depth : // unsigned , default = 1024

**VKS\_PARA\_ADDR\_PORT 0x310e**

Bit(s)	R/W	Default	Description
31: 0	R/W	3ff	Access address for vkstone para_lut,start address must be 0x09

**VKS\_PARA\_DATA\_PORT 0x310f**

Bit(s)	R/W	Default	Description
31: 0	R/W	/	Data access for vkstone para lut

Below are the detail registers of VKS\_PARA\_DATA\_PORT and VKS\_PARA\_ADDR\_PORT control:

**VKS\_SCL\_OFFSET00 ~ VKS\_SCL\_OFFSET16 0X09~0X19**

Bit(s)	R/W	Default	Description
31:20			reserved
19: 0	R/W	/	Left offset of the input pixel offset from the left 12bits pixel and 8 bits float phase

**VKS\_SCL\_STEP00 ~ VKS\_SCL\_STEP16 0X1A~0X2A**

Bit(s)	R/W	Default	Description
24:20			reserved
23: 0	R/W	/	Unsigned reg_scl_stepx for ratio of each line(defined piece),step:4.20 opxium = (ipxium << 20 )/step scale:4.2 = 1/step

**VKS\_PPS\_YCOEF00 ~ VKS\_PPS\_YCOEF32 0X2B~0X4B**

Bit(s)	R/W	Default	Description
31:24	R/W	/	Signed reg_vks_ycoef0 Poly_phase scalar coef
23:16	R/W	/	Signed reg_vks_ycoef1 Poly_phase scalar coef
15:8	R/W	/	Signed reg_vks_ycoef2 Poly_phase scalar coef
7: 0	R/W	/	Signed reg_vks_ycoef3 Poly_phase scalar coef

**VKS\_PPS\_CCOEF00 ~ VKS\_PPS\_CCOEF32 0X4C~0X6C**

Bit(s)	R/W	Default	Description
31:24	R/W	/	Signed reg_vks_ccoef0 Poly_phase scalar coef

23:16	R/W	/	Signed reg_vks_ccoeff1 Poly_phase scalar coef
15:8	R/W	/	Signed reg_vks_ccoeff2 Poly_phase scalar coef
7: 0	R/W	/	Signed reg_vks_ccoeff3 Poly_phase scalar coef

### 10.2.3.31 OSD1 registers

VIU OSD1\_CTRL\_STAT 0x1A10

Bit(s)	R/W	Default	Description
31	R/W	0	osd_cfg_syn_en : // unsigned , default =0 1: module enable sync by go_field 0: normal
30	R/W	0	ENABLE_FREE_CLK. 1 = Use free-running clock; 0 = Use gated clock to save power.
29	R	0	TEST_RD_DSR: Applicable only when OSD debug mode is enabled. 1 = A new pixel is ready at register VIU OSD1_TEST_RDDATA; 0 = No data ready.
/	/	/	/
27-24	R	0	OSD_BLK_MODE: the input pixel format of which the current OSD block is being processed. Dvalin src & normal src have different pixel format value for same format
23-22	R	0	OSD_BLK_PTR: The number of the current OSD block that is being processed.
21	R	0	OSD_ENABLE. 1 = OSD display is enabled; 0 = disabled.
20-12	R/W	0	GLOBAL_ALPHA: legal range 0 – 256. It is a 9-bit value that is multiplied to all output pixel's Alpha value, and then normalized, i.e.: $\text{Alpha\_tmp} = \text{Alpha\_internal} + (\text{Alpha\_internal} == 0 ? 0 : 1);$ $\text{Alpha\_out} = (\text{Alpha\_tmp} * \text{GLOBAL\_ALPHA}) / 256;$
11	R/W	0	TEST_RD_EN: OSD debug mode enable. 1 = Output pixels are not routed to VPP, instead they are presented on registers VIU OSD1_TEST_RDDATA, for CPU to read. 0 = Normal mode, pixels are output to VPP.
10-9	R/W	0	unused

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8-5	R/W	0	<p>CTRL_MTCH_Y: For OSD 444, 422 or 16-bit (COLOR_MATRIX = 0 or 1) mode, the input pixels contain no Alpha information, in order to associate the output pixel with an Alpha value, the following steps are taken:</p> <p>If TC_ALPHA_EN = 0, then all output pixels use a default Alpha value 0xFF;</p> <p>If TC_ALPHA_EN = 1, then the Alpha value is looked up by matching the pixel's Y/Cb/Cr against four Alpha registers' Y/Cb/Cr. If the pixel matches any one of the Alpha registers, then this register's Alpha value is used; If the pixel matches with more than one of the Alpha registers, then the lower Alpha register takes priority, e.g. use Alpha Reg0's value if the pixel matches both Alpha Reg0 and Reg1; If no match, then use default Alpha value 0xFF.</p> <p>There are two ways of matching: one way is that the pixel has to compare all Y, Cb and Cr value with the Alpha registers; the other way is that the pixel only has to compare Y value with the Alpha registers. CTRL_MTCH_Y defines which way is used to determine a match.</p> <p>Bit[0] is for matching Alpha register 0: 1 = only need to compare Y; 0 = compare all Y, Cb and Cr.</p> <p>Bit[1] is for matching Alpha register 1: 1 = only need to compare Y; 0 = compare all Y, Cb and Cr.</p> <p>Bit[2] is for matching Alpha register 2: 1 = only need to compare Y; 0 = compare all Y, Cb and Cr.</p> <p>Bit[3] is for matching Alpha register 3: 1 = only need to compare Y; 0 = compare all Y, Cb and Cr.</p>
4	R/W	0	<p>CTRL_422TO444.</p> <p>1 = Enable conversion of 422 format input to 444 format output;</p> <p>0 = Disable 422 to 444 conversion.</p>
/	/	/	/
2	R/W	0	<p>osd_mem_mode : // unsigned , default =0</p> <p>0:canvas_araddr</p> <p>1: linear_araddr (Dvalin src must use this mode)</p>
1	R/W	0	premult_en : // unsigned , default =0
0	R/W	0	OSD_BLK_ENABLE: Each bit to enable display an OSD block

**VIU OSD1\_CTRL\_STAT2 0x1A2d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	unused
15	R/W	0	unused
14	R/W	0	Replaced_alpha_en
13-6	R/W	0	Replaced_alpha
5-4	R/W	0	Hold_fifo_lines[6:5]
3	R/W	0	<p>RGBYUV_FULL_RANGE: Select coefficients for applicable output range.</p> <p>1 = output full range 0-255;</p> <p>0 = output range 16-235.</p>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
2	R/W	0	ALPHA_9B_MODE: Define how to expand 8-bit alpha value to 9-bit. 1 = The formula is (Alpha < 128) ? Alpha : Alpha + 1; 0 = The formula is (Alpha == 0) ? Alpha : Alpha + 1.
1	R/W	0	Pedding status cleanup
0	R/W	0	COLOR_EXPAND_MODE. 1 = Expand the color components to 8-bit by padding LSBs with MSBs. E.g. If the input is 5'b11000, the output is expanded to 8'b11000110; 0 = Expand the color components to 8-bit by padding LSBs with 0.

**VIU OSD1\_TCOLOR\_AG0 0x1A17****VIU OSD1\_TCOLOR\_AG1 0x1A18****VIU OSD1\_TCOLOR\_AG2 0x1A19****VIU OSD1\_TCOLOR\_AG3 0x1A1a**

Define Alpha register 0/1/2/3 values.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0xFF	Y or R.
23-16	R/W	0xFF	CB or G.
15-8	R/W	0xFF	CR or B.
7-0	R/W	0xFF	ALPHA.

**VIU OSD1\_BLK0\_CFG\_W0 0x1A1b**

Defines display block 0/1/2/3's property, word 0.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	Reserved
30	R/W	0	mali_src_en 1: read data from Dvalin afbcd decoder 0: read data from DDR directly
29	R/W	0	y_rev: 0=normal read, 1=reverse read in Y direction
28	R/W	0	x_rev: 0=normal read, 1=reverse read in X direction
27-24	R/W	0	Reserved
23-16	R/W	0	TBL_ADDR. Virtual canvas LUT entry.
15	R/W	0	LITTLE_ENDIAN: define the of data stored in DDR. 1 = Data stored in DDR memory are of little endian; 0 = Data stored in DDR memory are of big endian.
14	R/W	0	RPT_Y: For reducing data size stored in DDR.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			1 = For each line, OSD will display twice; 0 = No repeat, OSD display once per line.
13-12	R/W	0	INTERP_CTRL: If enabled, interpolate a data after each incoming pixels, in order to save DDR bandwidth. 0 = No interpolation; 1 = unused, no interpolation; 2 = Interpolate with preceding pixel value; 3 = Interpolate with the averaged value between the preceding pixel and the next pixel.
11-8	R/W	0	OSD_BLK_MODE: Define the OSD block's input pixel format. 0-2 = unused; 3 = 4:2:2 mode. Input 32-bit data for 2 pixels. Bit[31:24] is Y0, bit [23:16] is Cb0, bit[15:8] is Y1, bit [7:0] is Cr0, for Alpha value refer to reg VIU OSD1_CTRL_STAT.CTRL_MTCH_Y; 4 = 16-bit mode. Refer to COLOR_MATRIX; 5 = 32-bit mode. Refer to COLOR_MATRIX; 6 = unused; 7 = 24-bit mode. Refer to COLOR_MATRIX; 8-15 = unused;
6	R/W	0	TC_ALPHA_EN: refer to reg VIU OSD1_CTRL_STAT.CTRL_MTCH_Y. 1 = Enable alpha register matching. 0 = Disable.
5-2	R/W	0	COLOR_MATRIX: Applicable only to 16-bit color mode (OSD_BLK_MODE=4), 32-bit mode (OSD_BLK_MODE=5) and 24-bit mode (OSD_BLK_MODE=7), defines the bit-field allocation of the pixel data. For expanding the bit-fields to full 8-bit, refer to VIU OSD1_CTRL_STAT2.color_expand_mode  For 16-bit mode (OSD_BLK_MODE=4): 0 = 6:5:5 format. Bit[15:10] is Y[7:2] or R[7:2], bit[9:5] is Cb[7:3] or G[7:3], bit[4:0] is Cr[7:3] or B[7:3], for Alpha value refer to reg VIU OSD1_CTRL_STAT.CTRL_MTCH_Y; 1 = 8:4:4 format. Bit[15:8] is Y or R, bit[7:4] is Cb[7:4] or G[7:4], bit[3:0] is Cr[7:4] or B[7:4], for Alpha value refer to reg VIU OSD1_CTRL_STAT.CTRL_MTCH_Y; 4 = 5:6:5 format. Bit[15:11] is Y[7:3] or R[7:3], bit[10:5] is Cb[7:2] or G[7:2], bit[4:0] is Cr[7:3] or B[7:3], for Alpha value refer to reg VIU OSD1_CTRL_STAT.CTRL_MTCH_Y;  For 32-bit mode (OSD_BLK_MODE=5): 0 = RGBA 8:8:8:8 format. Bit[31:24] is Y or R, bit[23:16] is Cb or G; bit[15:8] is Cr or B; bit[7:0] is Alpha; 1 = ARGB 8:8:8:8 format. Bit[31:24] is Alpha, bit[23:16] is Y or R; bit[15:8] is Cb or G; bit[7:0] is Cr or B; 2 = ABGR 8:8:8:8 format. Bit[31:24] is Alpha, bit[23:16] is Cr or B; bit[15:8] is Cb or G; bit[7:0] is Y or R; 3 = BGRA 8:8:8:8 format. Bit[31:24] is Cr or B, bit[23:16] is Cb or G; bit[15:8] is Y or R; bit[7:0] is Alpha.  For 24-bit mode (OSD_BLK_MODE=7): 0 = RGB 8:8:8 mode. Bit[23:16] is Y or R, bit[15:8] is Cb or G, bit[7:0] is Cr or B, for Alpha value refer to reg VIU OSD1_CTRL_STAT.CTRL_MTCH_Y;

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			5 = BGR 8:8:8 mode. Bit[23:16] is Cr or B, bit[15:8] is Cb or G, bit[7:0] is Y or R, for Alpha value refer to reg VIU OSD1_CTRL_STAT.CTRL_MTCH_Y.
1	R/W	0	INTERLACE_EN. 1 = Enable interlace mode. 0 = Disable.
0	R/W	0	INTERLACE_SEL_ODD: Applicable only if INTERLACE_EN = 1. 1 = Only output odd lines; 0 = Only output even lines.

**VIU OSD1\_BLK0\_CFG\_W1 0x1A1c**

Defines display block 0/1/2/3's property, word 1.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R/W	0	Unused.
28-16	R/W	0	X_END. Virtual canvas co-ordinate.
15-13	R/W	0	Unused.
12-0	R/W	0	X_START. Virtual canvas co-ordinate.

**VIU OSD1\_BLK0\_CFG\_W2 0x1A1d**

Defines display block 0/1/2/3's property, word 2.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R/W	0	Unused.
28-16	R/W	0	Y_END. Virtual canvas co-ordinate.
15-13	R/W	0	Unused.
12-0	R/W	0	Y_START. Virtual canvas co-ordinate.

**VIU OSD1\_BLK0\_CFG\_W3 0x1A1e**

Defines display block 0/1/2/3's property, word 3.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-28	R/W	0	Unused.
27-16	R/W	0	H_END. Display horizontal co-ordinate.
15-12	R/W	0	Unused.
11-0	R/W	0	H_START. Display horizontal co-ordinate.

**VIU OSD1\_BLK0\_CFG\_W4 0x1A13**

Defines display block 0/1/2/3's property, word 4.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-28	R/W	0	Unused.
27-16	R/W	0	V_END. Display vertical co-ordinate.
15-12	R/W	0	Unused.
11-0	R/W	0	V_START. Display vertical co-ordinate.

**VIU OSD1\_BLK1\_CFG\_W4 0x1a14**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Frame_addr: // unsigned , default =0 Frame_addr in linear_addr

**VIU OSD1\_BLK2\_CFG\_W4 0x1a15**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	Line_stride : // unsigned , default =0 Line_stride in linear_addr

**VIU OSD1\_FIFO\_CTRL\_STAT 0x1A2b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	burst_len_sel[2] of [2:0]
30	R/W	0	BYTE_SWAP: In addition to endian control, further define whether to swap upper byte and lower byte within a 16-bit memory word. 1 = Swap, data[15:0] becomes {data[7:0], data[15:8]}; 0 = No swap, data[15:0] is still data[15:0].
29	R/W	0	Div_swap : swap the 2 64bits word in 128bits word
28-24	R/W	0	Fifo_lim : when osd fifo is small than the fifo_lim*16, closed the req port of osd_rd_mif
23-22	R/W	0	Fifo_ctrl: 00 : for 1 word in 1 burst, 01 : for 2words in 1burst, 10 : for 4 words in 1burst, 11: reserved
21-20	R	0	FIFO_ST: State of the FIFO activity. 0 = Idle; 1 = FIFO requesting; 2 = FIFO request aborting.
19	R	0	FIFO_OVERFLOW.
18-12	R/W	32	FIFO_DEPTH_VAL: Define the depth of FIFO which stores 128-bit data from DDR to be FIFO_DEPTH_VAL * 8.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11-10	R/W	0	BURST_LEN_SEL[1:0] of [2:0]: Define DDR burst request length. 0 = up to 24 per burst; 1 = up to 32 per burst; 2 = up to 48 per burst;/ 3 = up to 64 per burst. 4 = up to 96 per burst, 5 = up to 128 per burst
9-5	R/W	4	HOLD_FIFO_LINES: The number of lines that OSD must wait after VSYNC, before it starts request data from DDR .
4	R/W	0	CLEAR_ERR: One pulse to clear error status.
3	R/W	0	FIFO_SYNC_RST: Set 1 to reset OSD FIFO.
2-1	R/W	0	ENDIAN: define the endianess of the 64-bit data stored in memory, and how to convert. 0 = No conversion; 1 = Convert to {din[31:0], din[63:32]}; 2 = Convert to {din[15:0], din[31:16], din[47:32], din[63:48]}; 3 = Convert to {din[47:32], din[63:48], din[15:0], din[31:16]};
0	R/W	0	URGENT. 1 = Set DDR request priority to be urgent; 0 = Set DDR request priority to be normal.

**VIU OSD1\_TEST\_RDDATA 0x1A2c**

During OSD debug mode (VIU OSD1\_CTRL\_STAT.TEST\_RD\_EN = 1), the output pixels will be presented at this register.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R	0	Y or R.
23:16	R	0	Cb or G.
15-8	R	0	Cr or B.
7-0	R	0	Alpha[8:1].

**VIU OSD1\_PROT\_CTRL 0x1a2e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	urgent_ctrl : // unsigned , default =0
15	R.O	0	prot_en : // unsigned , default =0; 1=Borrow PROT's FIFO storage, either for rotate or non-rotate.
12: 0	R.O	0	prot_fifo_size : // unsigned , default =0; effective FIFO size when prot_en=1.

**VIU OSD1\_MALI\_UNPACK\_CTRL 0x1a2f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	mali_unpack_en 1: OSD will unpack mali_src 0: OSD will unpack normal src
28			Alpha_div_en: alpha divisor enable
27:26			Alpha_divisor gating clk
25:24			Alpha_mapping_mode In osd, this bit should be set 0 when Alpha_div_en active, means 8 bits alpha mode
17	/	/	/
16	R/W	0	afbcd_swap_64bit:
15: 12	R/W	1	afbcd_r_reordered, change osd output order when use Dvalin src: 1: r_re = r; 2: r_re = g; 3: r_re = b; 4: r_re = a; default: r_re = 0;
11: 8		2	afbcd_r_reordered, change osd output order when use Dvalin src: 1: g_re = r; 2: g_re = g; 3: g_re = b; 4: g_re = a; default: r_re = 0;
7: 4		3	afbcd_r_reordered, change osd output order when use Dvalin src: 1: b_re = r; 2: b_re = g; 3: b_re = b; 4: b_re = a; default: r_re = 0;
3: 0		4	afbcd_r_reordered, change osd output order when use Dvalin src: 1: a_re = r; 2: a_re = g; 3: a_re = b; 4: a_re = a; default: r_re = 0;

**VIU OSD1 DIMM CTRL 0x1adf**

Bit(s)	R/W	Default	Description
30	R/W	0	OSD dimm enable,osd out will be one color when this bit active
29:0	R/W	0	Osd_dim_rgb_out ,osd out will be this value when bit30 active

#### 10.2.3.34 VPP\_VD1\_MATRIX

**VPP\_VD1\_MATRIX\_COEF00\_01 0x3290**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Coefficient00, signed, 3.10
12-0	R/W	0	Coefficient01, signed, 3.10

**VPP\_VD1\_MATRIX\_COEF02\_10 0x3291**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Coefficient02, signed, 3.10
12-0	R/W	0	Coefficient10, signed, 3.10

**VPP\_VD1\_MATRIX\_COEF11\_12 0x3292**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Coefficient11, signed, 3.10
12-0	R/W	0	Coefficient12, signed, 3.10

**VPP\_VD1\_MATRIX\_COEF20\_21 0x3293**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Coefficient20, signed, 3.10
12-0	R/W	0	Coefficient21, signed, 3.10

**VPP\_VD1\_MATRIX\_COEF22 0x3294**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
18-16	R/W	0	convrs
12-0	R/W	0	Coefficient22, signed, 3.10

**VPP\_VD1\_MATRIX\_COEF13\_14 0x3295**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Coefficient13, signed, 3.10
12-0	R/W	0	Coefficient14, signed, 3.10

**VPP\_VD1\_MATRIX\_COEF23\_24 0x3296**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Coefficient23, signed, 3.10
12-0	R/W	0	Coefficient24, signed, 3.10

**VPP\_VD1\_MATRIX\_COEF15\_25 0x3297**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Coefficient15, signed, 3.10
12-0	R/W	0	Coefficient25, signed, 3.10

**VPP\_VD1\_MATRIX\_CLIP 0x3298**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-8	R/W	0x0	reserved
7-5	R/W	0x1	Matrix rs
4-3	R/W	0x10	Matrix clmod 0: only 3x3, 1: pre_offseted_ch1,ch2 > pre_offseted_ch0, use the added 2x3 coef 2: pre_offseted_ch1,ch2 > 0, use the added 2x3 coef 3: pre_offseted_ch1,ch2 > 512, use the added 2x3 coef
2-0	R/W	0x10	Matrix clip enable

**VPP\_VD1\_MATRIX\_OFFSET0\_1 0x3299**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0	Offset0, signed value
11-0	R/W	0	Offset1, signed value

**VPP\_VD1\_MATRIX\_OFFSET2 b 0x329a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11-0	R/W	0	Offset2, signed value

**VPP\_VD1\_MATRIX\_PRE\_OFFSET0\_1 0x329b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0	pre_Offset0, signed value
11-0	R/W	0	Pre_Offset1, signed value

**VPP\_VD1\_MATRIX\_PRE\_OFFSET2 0x329c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11-0	R/W	0	Pre_Offset2, signed value

**VPP\_VD1\_MATRIX\_EN\_CTRL 0x329d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:4	R/W	0	Gate clock ctrl
1	R/W	0	Enable_sync_sel

Bit(s)	R/W	Default	Description
11-0	R/W	0	lfifo_buf_size

**VDIN0\_COM\_GCLK\_CTRL 0x121b**

Bit(s)	R/W	Default	Description
15-14	R/W	0	Gate clock control for blackbar detector
13-12	R/W	0	Gate clock control for hist
11-10	R/W	0	Gate clock control for line fifo
9-8	R/W	0	Gate clock control for matrix
7-6	R/W	0	Gate clock control for horizontal scaler
5-4	R/W	0	Gate clock control for pre scaler
3-2	R/W	0	Gate clock control for vdin_com_proc
1-0	R/W	0	Gate clock control for the vdin reg

**VDIN0\_INTF\_WIDTHM1 0x121c**

Bit(s)	R/W	Default	Description
26	R/W	0	VDIN write mif bvalid_sel: 1. Bvalid_singnal from bus, 0: bytes_wr handshakes
25	R/W	0	VDIN write mif burst last sel: 1. All kind of burst last signal include ext_data_last. 0. Used the normal burst last signal
12-0	R/W	0	VDIN input interface width minus 1, before the window function, after the de decimation

**VDIN0\_WR\_CTRL2 0x121f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19	R/W	0	Vdin0 wr bit10 mode
18	R/W	0	Data_ext_en 1: send out data if req was interrupt by soft reset 0 : normal mode
17:16	R/W	1	Words_lim[1:0] : it would not send out request before Words_lim *16 words were ready
15:12	R/W	1	Burst_lim : 00 , 1 word in 1burst , 01 ,2 words in 1burst, 10, 4 words in 1burst , 11 reserved
10:9	R/W	0	Words_lim[3:2]
8	R/W	0	1: discard data before line fifo, 0: normal mode
7-0	R/W	0	Write chroma canvas address, for NV12/21 mode.

**VDIN0\_WR\_CTRL 0x1220**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0	vdin0_wr_mif_hconv_mode. Applicable only to vdin_write_format=0 or 2. 0=Output every even pixel's CbCr; 1=Output every odd pixel's CbCr; 2=Output an average value per even&odd pair of pixels; 3=Output all CbCr. Only applies to vdin_write_format =2.
29	R/W	0	vdin0_wr_mif_no_clk_gate. If true, enable free-run clock.
28	R/W	0	clear write response counter in the vdin write memory interface
27	R/W	1	eol_sel, 1: use eol as the line end indication, 0: use width as line end indication in the vdin write memory interface
26	R/W	0	vcp_nr_en. Only used in VDIN0. NOT used in VDIN1
25	R/W	1	vcp_wr_en Only used in VDIN0. NOT used in VDIN1
24	R/W	1	vcp_in_en Only used in VDIN0. NOT used in VDIN1
23	R/W	1	vdin frame reset enable, if true, it will provide frame reset during go_field(vsync) to the modules after that
22	R/W	1	vdin line fifo soft reset enable, meaning, if true line fifo will reset during go_field (vsync)
21	R/W	0	vdin direct write done status clear bit
20	R/W	0	vdin NR write done status clear bit
19	R/W	0	Vdin0_wr words swap : swap the 2 64bits word in 128 words
18	R/W	0	vdin0_wr_mif_swap_cbcr. Applicable only to vdin_write_format =2. 0=Output CbCr (NV12); 1=Output CrCb (NV21);

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
17:16	R/W	0	vdin0_wr_mif_vconv_mode. Applicable only to vdin_write_format=2. 0=Output every even line's CbCr; 1=Output every odd line's CbCr; 2=Reserved; 3=Output all CbCr.
13-12	R/W	0	vdin_write_format, 0: 4:2:2 to one canvas; 1: 4:4:4 to one canvas; 2: Y to luma canvas, CbCr to chroma canvas, for NV12/21; 3: yuv422 full pack mode
11	R/W	0	vdin write canvas double buffer enable, means the canvas address will be latched by vsync before using
9	R/W	0	vdin write request urgent
8	R/W	0	vdin write request enable
7-0	R/W	0	Write canvas address (For NV12/21 mode, it's LUMA canvas)

**VDIN0\_WR\_H\_START\_END 0x1221**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29	R/W	0	if true, horizontal reverse
28-16	R/W	0	start
12-0	R/W	0	end

**VDIN0\_WR\_V\_START\_END 0x1222**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

12-0	R/W	0	end

**VDIN0\_VSC\_PHASE\_STEP 0x1223**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24-16	R/W	0	integer portion
19-0	R/W	0	fraction portion

**VDIN0\_VSC\_INI\_CTRL 0x1224**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23	R/W	0	vsc_en, vertical scaler enable
21	R/W	0	vsc_phase0_always_en, when scale up, you have to set it to 1
20-16	R/W	0	ini skip_line_num

15-0	R/W	0	vscaler ini_phase
------	-----	---	-------------------

**VDIN0\_SCIN\_HEIGHTM1 0x1225**

Bit(s)	R/W	Default	Description
12-0	R/W	0x437	scaler input height minus 1

**VDIN0\_DUMMY\_DATA 0x1226**

Bit(s)	R/W	Default	Description
23-16	R/W	0	dummy component 0
15-8	R/W	0x80	dummy component 1
7-0	R/W	0x80	dummy component 2

**VDIN0\_MATRIX\_PROBE\_COLOR 0x1228**

Bit(s)	R/W	Default	Description
29-20	R/W	0	component 0
19-10	R/W	0	component 1
9-0	R/W	0	component 2

**VDIN0\_MATRIX\_HL\_COLOR 0x1229**

Bit(s)	R/W	Default	Description
23-16	R/W	0	component 0
15-8	R/W	0	component 1
7-0	R/W	0	component 2

**VDIN0\_MATRIX\_PROBE\_POS 0x122a**

Bit(s)	R/W	Default	Description
28-16	R/W	0	probe x, position
12-0	R/W	0	probe y, position

**VDIN0\_HIST\_CTRL 0x1230**

Bit(s)	R/W	Default	Description
31-24	R/W	0	No use
23-16	R/W	0	No use
11	R/W	0	Hist 34bin only mode
10-9	R/W	0	ldim_stts_din_sel, 00: from matrix0 dout, 01: from vsc_dout, 10: from matrix1 dout, 11: form matrix1 din

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8	R/W	0	ldim_stts_en
6-5	R/W	0	hist_dnlp_low the real pixels in each bins got by VDIN_DNLP_HISTXX should multiple with 2^(dnlp_low+3)
3-2	R/W	0	hist_din_sel the source used for hist statistics. 2'b00: from MAT0_dout; 2'b01: from vsc_dout; 2'b10: from mat1_dout, 3: mat1_din
1	R/W	0	hist_win_en 1'b0: hist used for full picture; 1'b1: hist used for pixels within hist window
0	R/W	0	hist_spl_en 1'b0: disable hist readback; 1'b1: enable hist readback

**VDIN0\_HIST\_H\_START\_END 0x1231**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	hist_hstart horizontal start value to define hist window
12-0	R/W	0	hist_hend horizontal end value to define hist window

**VDIN0\_HIST\_V\_START\_END 0x1232**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	hist_vstart vertical start value to define hist window
12-0	R/W	0	hist Vend vertical end value to define hist window

**VDIN0\_HIST\_MAX\_MIN 0x1233**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-8	R	0	hist_max maximum value
7-0	R	0	hist_min minimum value

**VDIN0\_HIST\_SPL\_VAL 0x1234**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R	0	hist_spl_rd , counts for the total luma value

**VDIN0\_HIST\_SPL\_PIX\_CNT 0x1235**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
21-0	R	0	hist_spl_pixel_count, counts for the total calculated pixels

**VDIN0\_HIST\_CHROMA\_SUM 0x1236**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R	0	hist_chroma_sum , counts for the total chroma value

**VDIN0\_DNL\_P\_HIST00 0x1237**

//0-255 are splited to 64 bins evenly, and VDIN\_DNLP\_HISTXX

//are the statistic number of pixels that within each bin.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 2nd bin
15-0	R	0	counts for the 1st bin

#### **VDIN0\_DNLP\_HIST01 0x1238**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 4th bin
15-0	R	0	counts for the 3rd bin

#### **VDIN0\_DNLP\_HIST02 0x1239**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 6th bin
15-0	R	0	counts for the 5th bin

#### **VDIN0\_DNLP\_HIST03 0x123a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 8th bin
15-0	R	0	counts for the 7th bin

#### **VDIN0\_DNLP\_HIST04 0x123b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 10th bin
15-0	R	0	counts for the 9th bin

#### **VDIN0\_DNLP\_HIST05 0x123c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 12th bin
15-0	R	0	counts for the 11th bin

#### **VDIN0\_DNLP\_HIST06 0x123d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 14th bin
15-0	R	0	counts for the 13th bin

#### **VDIN0\_DNLP\_HIST07 0x123e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 16th bin
15-0	R	0	counts for the 15th bin

31-16	R	0	counts for the 16th bin
15-0	R	0	counts for the 15th bin

**VDIN0\_DNLP\_HIST08 0x123f**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 18th bin
15-0	R	0	counts for the 17th bin

**VDIN0\_DNLP\_HIST09 0x1240**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 20th bin
15-0	R	0	counts for the 19th bin

**VDIN0\_DNLP\_HIST10 0x1241**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 22nd bin
15-0	R	0	counts for the 21st bin

**VDIN0\_DNLP\_HIST11 0x1242**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 24th bin
15-0	R	0	counts for the 23rd bin

**VDIN0\_DNLP\_HIST12 0x1243**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 26th bin
15-0	R	0	counts for the 25th bin

**VDIN0\_DNLP\_HIST13 0x1244**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 28th bin
15-0	R	0	counts for the 27th bin

**VDIN0\_DNLP\_HIST14 0x1245**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 30th bin

15-0	R	0	counts for the 29th bin
------	---	---	-------------------------

**VDIN0\_DNLP\_HIST15 0x1246**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 32nd bin
15-0	R	0	counts for the 31st bin

**VDIN0\_DNLP\_HIST16 0x1247**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 34th bin
15-0	R	0	counts for the 33rd bin

**VDIN0\_DNLP\_HIST17 0x1248**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 36th bin

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 48th bin
15-0	R	0	counts for the 47th bin

**VDIN0\_DNLP\_HIST24 0x124f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 50th bin
15-0	R	0	counts for the 49th bin

**VDIN0\_DNLP\_HIST25 0x1250**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 52nd bin
15-0	R	0	counts for the 51st bin

**VDIN0\_DNLP\_HIST26 0x1251**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 54th bin
15-0	R	0	counts for the 53rd bin

**VDIN0\_DNLP\_HIST27 0x1252**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 56th bin
15-0	R	0	counts for the 55th bin

**VDIN0\_DNLP\_HIST28 0x1253**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 58th bin
15-0	R	0	counts for the 57th bin

**VDIN0\_DNLP\_HIST29 0x1254**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31-16	R	0	counts for the 60th bin
15-0	R	0	counts for the 59th bin

**VDIN0\_DNLP\_HIST30 0x1255**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 62nd bin
15-0	R	0	counts for the 61st bin

**VDIN0\_DNLP\_HIST31 0x1256**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 64th bin
15-0	R	0	counts for the 63rd bin

**VDIN0\_LDIM\_STTS\_HIST\_REGION\_IDX 0x1257**

Bit(s)	R/W	Default	Description
31	R	0	local dimming max statistic enable
28	R	0	eol enable
27-25	R	0	vertical line overlap number for max finding
24-22	R	0	horizontal pixel overlap number, 0: 17 pix, 1: 9 pix, 2: 5 pix, 3: 3 pix, 4: 0 pix
20	R	0	1,2,1 low pass filter enable before max/hist statistic
19-16	R	0	region H/V position index, refer to VDIN_LDIM_STTS_HIST_SET_REGION
15	R	0	1: region read index auto increase per read to VDIN_LDIM_STTS_HIST_READ_REGION
6-0	R	0	region read index

**VDIN0\_LDIM\_STTS\_HIST\_SET\_REGION 0x1258**

Bit(s)	R/W	Default	Description
--------	-----	---------	-------------

28:16	R	0	if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h0: read/write hvstart0 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h1: read/write hend01 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h2: read/write vend01 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h3: read/write hend23 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h4: read/write vend23 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h5: read/write hend45 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h6: read/write vend45 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'd7: read/write hend67 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h8: read/write vend67 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'h9: read/write hend89 if VDIN_LDIM_STTS_HIST_REGION_IDX[19:16] == 5'ha: read/write vend89 //hvstart0, Bit 28:16 row0 vstart, Bit 12:0 col0 hstart //hend01, Bit 28:16 col1 hend, Bit 12:0 col0 hend //vend01, Bit 28:16 row1 vend, Bit 12:0 row0 vend //hend23, Bit 28:16 col3 hend, Bit 12:0 col2 hend //vend23, Bit 28:16 row3 vend, Bit 12:0 row2 vend //hend45, Bit 28:16 col5 hend, Bit 12:0 col4 hend //vend45, Bit 28:16 row5 vend, Bit 12:0 row4 vend //hend67, Bit 28:16 col7 hend, Bit 12:0 col6 hend //vend67, Bit 28:16 row7 vend, Bit 12:0 row6 vend //hend89, Bit 28:16 col9 hend, Bit 12:0 col8 hend //vend89, Bit 28:16 row9 vend, Bit 12:0 row8 vend

**VDIN0\_LDIM\_STTS\_HIST\_READ\_REGION 0x1259**

Bit(s)	R/W	Default	Description
29:20	R	0	Max_comp2
19:10	R	0	Max_comp1
9:0	R	0	Max_comp0

**VDIN0\_MEAS\_CTRL0 0x125a**

Bit(s)	R/W	Default	Description
18	R/W	0	reset bit, high active
17	R/W	0	if true, widen hs/vs pulse
16	R/W	0	vsync total counter always accumulating enable
14-12	R/W	0	select hs/vs of video input channel to measure, 0: no selection, 1:vdi1, 2:vid2: 3:vid3, 4:vid4, 5:vdi5, 6:vdi6, 7:vdi7.
11-4	R/W	0	vsync_span, define how many vsync span need to measure

2-0	R/W	0	meas_hs_index, index to select which HS counter/range
-----	-----	---	---

**VDIN0\_MEAS\_VS\_COUNT\_HI 0x125b**

Bit(s)	R/W	Default	Description
19-16	R	0	meas_ind_total_count_n, every number of sync_span vsyncs, this count add 1
15-0	R	0	high bit portion of vsync total counter

**VDIN0\_MEAS\_VS\_COUNT\_LO 0x125c**

Bit(s)	R/W	Default	Description
31-0	R	0	low bit portion of vsync total counter

**VDIN0\_MEAS\_HS\_RANGE 0x125d**

//according to the meas\_hs\_index in register VDIN\_MEAS\_CTRL0

//meas\_hs\_index == 0, first hs range

//meas\_hs\_index == 1, second hs range

//meas\_hs\_index == 2, third hs range

//meas\_hs\_index == 3, fourth hs range

Bit(s)	R/W	Default	Description
28-16	R	0	count_start
12-0	R	0	count_end

**VDIN0\_MEAS\_HS\_COUNT 0x125e**

//according to the meas\_hs\_index in register VDIN\_MEAS\_CTRL0,

//meas\_hs\_index == 0, first range hs counter,

//meas\_hs\_index == 1, second range hs

//meas\_hs\_index == 2, third range hs

//meas\_hs\_index == 3, fourth range hs

Bit(s)	R/W	Default	Description
23-0	R	0	Hs counter

**VDIN0\_BLKBAR\_CTRL1 0x125f**

Bit(s)	R/W	Default	Description
8	R/W	0	white_enable
7-0	R/W	0	blkbar_white_level

**VDIN0\_BLKBAR\_CTRL0 0x1260**

Bit(s)	R/W	Default	Description
31-24	R/W	0	blkbar_black_level threshold to judge a black point

20-8	R/W	0	blkbar_hwidht left and right region width
7-5	R/W	0	blkbar_comp_sel select yin or uin or vin to be the valid input
4	R/W	0	blkbar_sw_statistic_en enable software statistic of each block black points number
3	R/W	0	blkbar_det_en
2-1	R/W	0	blkbar_din_sel, 0:mat0_dout, 1:vsc_dout, 2:mat1_dout, 3:mat1_din
0	R/W	0	Blkbar_det_top_en

**VDIN0\_BLKBAR\_H\_START\_END 0x1261**

Bit(s)	R/W	Default	Description
28-16	R/W	0	blkbar_hstart. Left region start
12-0	R/W	0	blkbar_hend. Right region end

**VDIN0\_BLKBAR\_V\_START\_END 0x1262**

Bit(s)	R/W	Default	Description
28-16	R/W	0	blkbar_vstart.
12-0	R/W	0	blkbar_vend.

**VDIN0\_BLKBAR\_CNT\_THRESHOLD 0x1263**

Bit(s)	R/W	Default	Description
19-0	R/W	0	blkbar_cnt_threshold. threshold to judge whether a block is totally black

**VDIN0\_BLKBAR\_ROW\_TH1\_TH2 0x1264**

Bit(s)	R/W	Default	Description
28-16	R/W	0	blkbar_row_th1. //threshold of the top blackbar
12-0	R/W	0	blkbar_row_th2 //threshold of the bottom blackbar

**VDIN0\_BLKBAR\_IND\_LEFT\_START\_END 0x1265**

Bit(s)	R/W	Default	Description
28-16	R	0	blkbar_ind_left_start. horizontal start of the left region in the current searching
12-0	R	0	blkbar_ind_left_end. horizontal end of the left region in the current searching

**VDIN0\_BLKBAR\_IND\_RIGHT\_START\_END 0x1266**

Bit(s)	R/W	Default	Description
28-16	R	0	blkbar_ind_right_start. horizontal start of the right region in the current searching
12-0	R	0	blkbar_ind_right_end. horizontal end of the right region in the current searching

**VDIN0\_BLKBAR\_IND\_LEFT1\_CNT 0x1267**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_left1_cnt. Black pixel counter. left part of the left region

**VDIN0\_BLKBAR\_IND\_LEFT2\_CNT 0x1268**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_left2_cnt. Black pixel counter. right part of the left region

**VDIN0\_BLKBAR\_IND\_RIGHT1\_CNT 0x1269**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_right1_cnt. Black pixel counter. left part of the right region

**VDIN0\_BLKBAR\_IND\_RIGHT2\_CNT 0x126a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_right2_cnt. Black pixel counter. right part of the right region

**VDIN0\_BLKBAR\_STATUS0 0x126b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29	R	0	blkbar_ind_black_det_done. LEFT/RIGHT Black detection done
28-16	R	0	blkbar_top_pos. Top black bar position
12-0	R	0	blkbar_bot_pos. Bottom black bar position

**VDIN0\_BLKBAR\_STATUS1 0x126c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R	0	blkbar_left_pos. Left black bar position
12-0	R	0	blkbar_right_pos. Right black bar position

**VDIN0\_WIN\_H\_START\_END ? ? ? 0x126d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	input window H start
12-0	R/W	0	input window H end

**VDIN0\_WIN\_V\_START\_END ? ? ? 0x126e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	input window V start

12-0	R/W	0	input window V end
------	-----	---	--------------------

**VDIN0 ASFIFO\_CTRL3 0x126f**

Bit(s)	R/W	Default	Description
31	R/W	0	Vdi9 DE enable
30	R/W	0	Vdi9 go field enable
29	R/W	0	Vdi9 go line enable
28	R/W	0	Vdi9 if true, negative active input vsync
27	R/W	0	Vdi9 if true, negative active input hsync
26	R/W	0	Vdi9 vsync soft reset fifo enable
25	R/W	0	Vdi9 overflow status clear
24	R/W	0	Vdi9 asfifo soft reset, level signal

16	R/W		vdi2 asfifo soft reset, level signal
7	R/W	0	Vdi1 DE enable
6	R/W	0	Vdi1 go field enable
5	R/W	0	Vdi1 go line enable
4	R/W	0	Vdi1 if true, negative active input vsync
3	R/W	0	Vdi1 if true, negative active input hsync
2	R/W	0	Vdi1 vsync soft reset fifo enable
1	R/W	0	Vdi1 overflow status clear
0	R/W	0	Vdi1 asfifo soft reset, level signal

**VDIN1\_AS FIFO\_CTRL1 0x1309**

Bit(s)	R/W	Default	Description
23	R/W	0	Vdi4 DE enable
22	R/W	0	Vdi4 go field enable
21	R/W	0	Vdi4 go line enable
20	R/W	0	Vdi4 if true, negative active input vsync

19	R/W	0	Vdi4 if true, negative active input hsync
18	R/W	0	Vdi4 vsync soft reset fifo enable
17	R/W	0	Vdi4 overflow status clear
16	R/W	0	Vdi4 asfifo soft reset, level signal
7	R/W	0	Vdi3 DE enable
6	R/W	0	Vdi3 go field enable
5	R/W	0	Vdi3 go line enable
4	R/W	0	Vdi3 if true, negative active input vsync
3	R/W	0	Vdi3 if true, negative active input hsync
2	R/W	0	Vdi3 vsync soft reset fifo enable
1	R/W	0	Vdi3 overflow status clear
0	R/W	0	Vdi3 asfifo soft reset, level signal

**VDIN1\_WIDTHM1I\_WIDTHM1O 0x130a**

Bit(s)	R/W	Default	Description
28-16	R/W	0	input width minus 1, after the window function
12-0	R/W	0	output width minus 1

**VDIN1\_SC\_MISC\_CTRL 0x130b**

Bit(s)	R/W	Default	Description
14-8	R/W	0	hsc_ini_pixi_ptr, signed data, only useful when short_lineo_en is true
7	R/W	0	prehsc_en
6	R/W	0	hsc_en
5	R/W	0	hsc_short_lineo_en, short line output enable
4	R/W	0	hsc_nearest_en
3	R/W	0	Hsc_phase0_always_en
3	R/W	0	phase0_always_en
2-0	R/W	0	hsc_bank_length

**VDIN1\_HSC\_PHASE\_STEP 0x130c**

Bit(s)	R/W	Default	Description
28-24	R/W	0	integer portion
23-0	R/W	0	fraction portion

**VDIN1\_HSC\_INI\_CTRL 0x130d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30-29	R/W	0	hscale rpt_p0_num
28-24	R/W	0	hscale ini_rcv_num
23-0	R/W	0	hscale ini_phase

**VDIN1\_COM\_STATUS2 0x130e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23	R	0	Vdi7 fifo overflow
21-16	R	0	Vdi7_asfifo_cnt
15	R	0	Vdi6 fifo overflow
13-8	R	0	Vdi6_asfifo_cnt
7	R	0	vdi5 fifo overflow
5-0	R	0	vdi5_asfifo_cnt

**VDIN1\_AS FIFO\_CTRL2 0x130f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
25	R/W	0	if true, decimation counter sync with first valid DE in the field, //otherwise the decimation counter is not sync with external signal
24	R/W	0	decimation de enable
23-20	R/W	0	decimation phase, which counter value use to decimate,
19-16	R/W	0	decimation number, 0: not decimation, 1: decimation 2, 2: decimation 3 ....
7	R/W	0	Vdi5 DE enable
6	R/W	0	Vdi5 go field enable
5	R/W	0	Vdi5 go line enable
4	R/W	0	Vdi5 if true, negative active input vsync
3	R/W	0	Vdi5 if true, negative active input hsync
2	R/W	0	Vdi5 vsync soft reset fifo enable
1	R/W	0	Vdi5 overflow status clear
0	R/W	0	Vdi5 asfifo soft reset, level signal

**VDIN1\_MATRIX\_CTRL 0x1310**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

0	R/W	0	post conversion matrix enable
---	-----	---	-------------------------------

**VDIN1\_MATRIX\_COEF00\_01 0x1311**

Bit(s)	R/W	Default	Description
28-16	R/W	0	coef00
12-0	R/W	0	coef01

**VDIN1\_MATRIX\_COEF02\_10 0x1312**

Bit(s)	R/W	Default	Description
28-16	R/W	0	coef02
12-0	R/W	0	Coef10

**VDIN1\_MATRIX\_COEF11\_12 0x1313**

Bit(s)	R/W	Default	Description
28-16	R/W	0	Coef11
12-0	R/W	0	Coef12

**VDIN1\_MATRIX\_COEF20\_21 0x1314**

Bit(s)	R/W	Default	Description
28-16	R/W	0	Coef20
12-0	R/W	0	coef21

**VDIN1\_ 0x1315**

Bit(s)	R/W	Default	Description
18-16	R/W	0	convrs
7-0	R/W	0	Coef22

**VDIN1\_MATRIX\_OFFSET0\_1 0x1316**

Bit(s)	R/W	Default	Description
26-16	R/W	0	offset0
10-0	R/W	0	Offset1

**VDIN1\_MATRIX\_OFFSET2 0x1317**

Bit(s)	R/W	Default	Description
10-0	R/W	0	Offset2

**VDIN1\_MATRIX\_PRE\_OFFSET0\_1 0x1318**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26-16	R/W	0	Pre_offset0
10-0	R/W	0	Pre_Offset1

**VDIN1\_MATRIX\_PRE\_OFFSET2 0x1319**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10-0	R/W	0	Pre_Offset2

**VDIN1\_LFIFO\_CTRL 0x131a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11-0	R/W	0	lfifo_buf_size

**VDIN1\_COM\_GCLK\_CTRL 0x131b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-14	R/W	0	Gate clock control for blackbar detector
13-12	R/W	0	Gate clock control for hist
11-10	R/W	0	Gate clock control for line fifo
9-8	R/W	0	Gate clock control for matrix
7-6	R/W	0	Gate clock control for horizontal scaler
5-4	R/W	0	Gate clock control for pre scaler
3-2	R/W	0	Gate clock control for vdin_com_proc
1-0	R/W	0	Gate clock control for the vdin reg

**VDIN1\_INTF\_WIDTHM1 0x131c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26	R/W	0	VDIN write mif bvalid_sel: 1. Bvalid_singnal from bus, 0: bytes_wr handshakes
25	R/W	0	VDIN write mif burst last sel: 1. All kind of burst last signal include ext_data_last. 0. Used the normal burst last signal
12-0	R/W	0	VDIN input interface width minus 1, before the window function, after the de decimation

**VDIN1\_WR\_CTRL2 0x131f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19	R/W	0	Vdin1 wr bit10 mode

18	R/W	0	Data_ext_en 1: send out data if req was interrupt by soft reset 0 : normal mode
17:16	R/W	1	Words lim[1:0]: it would not send out request before Words_lim *16 words were ready
15:12	R/W	1	Burst_lim : 00 , 1 word in 1burst , 01 ,2 words in 1burst, 10, 4 words in 1burst , 11 reserved
10:9	R/W	0	Words_lim[3:2]
8	R/W	0	1: discard data before line fifo, 0: normal mode
7-0	R/W	0	Write chroma canvas address, for NV12/21 mode.

**VDIN1\_WR\_CTRL 0x1320**

Bit(s)	R/W	Default	Description
31-30	R/W	0	vdin1_wr_mif_hconv_mode. Applicable only to vdin_write_format=0 or 2. 0=Output every even pixel's CbCr; 1=Output every odd pixel's CbCr; 2=Output an average value per even&odd pair of pixels; 3=Output all CbCr. Only applies to vdin_write_format =2.
29	R/W	0	vdin1_wr_mif_no_clk_gate. If true, enable free-run clock.
28	R/W	0	clear write response counter in the vdin write memory interface
27	R/W	1	eol_sel, 1: use eol as the line end indication, 0: use width as line end indication in the vdin write memory interface
23	R/W	1	vdin frame reset enable, if true, it will provide frame reset during go_field(vsync) to the modules after that
22	R/W	1	vdin line fifo soft reset enable, meaning, if true line fifo will reset during go_field (vsync)
21	R/W	0	vdin direct write done status clear bit
20	R/W	0	vdin NR write done status clear bit
19	R/W	0	Vdin0_wr words swap : swap the 2 64bits word in 128 words
18	R/W	0	vdin1_wr_mif_swap_cbcr. Applicable only to vdin_write_format =2. 0=Output CbCr (NV12); 1=Output CrCb (NV21);
17:16	R/W	0	vdin1_wr_mif_vconv_mode. Applicable only to vdin_write_format=2. 0=Output every even line's CbCr; 1=Output every odd line's CbCr; 2=Reserved; 3=Output all CbCr.
13-12	R/W	0	vdin_write_format, 0: 4:2:2 to one canvas; 1: 4:4:4 to one canvas; 2: Y to luma canvas, CbCr to chroma canvas, for NV12/21; 3: 4:2:2 10 bit full pack mode
11	R/W	0	vdin write canvas double buffer enable, means the canvas address will be latched by vsync before using

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
9	R/W	0	vdin write request urgent
8	R/W	0	vdin write request enable
7-0	R/W	0	Write canvas address (For NV12/21 mode, it's LUMA canvas)

**VDIN1\_WR\_H\_START\_END 0x1321**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0	start
11-0	R/W	0	end

**VDIN1\_WR\_V\_START\_END 0x1322**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27-16	R/W	0	start
11-0	R/W	0	end

**VDIN1\_VSC\_PHASE\_STEP 0x1323**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24-16	R/W	0	integer portion
19-0	R/W	0	fraction portion

**VDIN1\_VSC\_INI\_CTRL 0x1324**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23	R/W	0	vsc_en, vertical scaler enable
21	R/W	0	vsc_phase0_always_en, when scale up, you have to set it to 1
20-16	R/W	0	ini skip_line_num
15-0	R/W	0	vscaler ini_phase

**VDIN1\_SCIN\_HEIGHTM1 0x1325**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12-0	R/W	0x437	scaler input height minus 1

**VDIN1\_DUMMY\_DATA 0x1326**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23-16	R/W	0	dummy component 0
15-8	R/W	0x80	dummy component 1

7-0	R/W	0x80	dummy component 2
-----	-----	------	-------------------

**VDIN1\_MATRIX\_PROBE\_COLOR 0x1328**

Bit(s)	R/W	Default	Description
29-20	R/W	0	component 0
19-10	R/W	0	omponent 1
9-0	R/W	0	component 2

**VDIN1\_MATRIX\_HL\_COLOR 0x1329**

Bit(s)	R/W	Default	Description
23-16	R/W	0	component 0
15-8	R/W	0	component 1
7-0	R/W	0	component 2

**VDIN1\_MATRIX\_PROBE\_POS 0x132a**

Bit(s)	R/W	Default	Description
28-16	R/W	0	probe x, position
12-0	R/W	0	probe y, postion

**VDIN1\_HIST\_CTRL 0x1330**

Bit(s)	R/W	Default	Description
31-24	R/W	0	Hist pixel white threshold, larger than this will be counted as white pixel number
23-16	R/W	0	Hist pixel black threshold, less than this will be counted as black pixel number
11	R/W	0	Hist 32bin only mode
10-9	R/W	0	ldim_stts_din_sel, 00: from matrix0 dout, 01: from vsc_dout, 10: from matrix1 dout, 11: form matrix1 din
8	R/W	0	ldim_stts_en
6-5	R/W	0	hist_dnlp_low the real pixels in each bins got by VDIN_DNLP_HISTXX should multiple with 2^(dnlp_low+3)
3-2	R/W	0	hist_din_sel the source used for hist statistics. 2'b00: from MAT0_dout; 2'b01: from vsc_dout; 2'b10: from mat1_dout, 3: mat1_din
1	R/W	0	hist_win_en 1'b0: hist used for full picture; 1'b1: hist used for pixels within hist window
0	R/W	0	hist_spl_en 1'b0: disable hist readback; 1'b1: enable hist readback

**VDIN1\_HIST\_H\_START\_END 0x1331**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	hist_hstart horizontal start value to define hist window
12-0	R/W	0	hist_hend horizontal end value to define hist window

**VDIN1\_HIST\_V\_START\_END 0x1332**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	hist_vstart vertical start value to define hist window
12-0	R/W	0	hist_vend vertical end value to define hist window

**VDIN1\_HIST\_MAX\_MIN 0x1333**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-8	R	0	hist_max maximum value
7-0	R	0	hist_min minimum value

**VDIN1\_HIST\_SPL\_VAL 0x1334**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R	0	hist_spl_rd , counts for the total luma value

**VDIN1\_HIST\_SPL\_PIX\_CNT 0x1335**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
21-0	R	0	hist_spl_pixel_count, counts for the total calculated pixels

**VDIN1\_HIST\_CHROMA\_SUM 0x1336**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R	0	hist_chroma_sum , counts for the total chroma value

**VDIN1\_DNLP\_HIST00 0x1337**

//0-255 are splitted to 64 bins evenly, and VDIN\_DNLP\_HISTXX

//are the statistic number of pixels that within each bin.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 2nd bin
15-0	R	0	counts for the 1st bin

**VDIN1\_DNLP\_HIST01 0x1338**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 4th bin

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15-0	R	0	counts for the 3rd bin

**VDIN1\_DNLP\_HIST02 0x1339**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 6th bin
15-0	R	0	counts for the 5th bin

**VDIN1\_DNLP\_HIST03 0x133a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 8th bin
15-0	R	0	counts for the 7th bin

**VDIN1\_DNLP\_HIST04 0x133b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 10th bin
15-0	R	0	counts for the 9th bin

**VDIN1\_DNLP\_HIST05 0x133c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 12th bin
15-0	R	0	counts for the 11th bin

**VDIN1\_DNLP\_HIST06 0x133d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 14th bin
15-0	R	0	counts for the 13th bin

**VDIN1\_DNLP\_HIST07 0x133e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 16th bin
15-0	R	0	counts for the 15th bin

**VDIN1\_DNLP\_HIST08 0x133f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 18th bin

15-0	R	0	counts for the 17th bin
------	---	---	-------------------------

**VDIN1\_DNLP\_HIST09 0x1340**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 20th bin
15-0	R	0	counts for the 19th bin

**VDIN1\_DNLP\_HIST10 0x1341**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 22nd bin
15-0	R	0	counts for the 21st bin

**VDIN1\_DNLP\_HIST11 0x1342**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 24th bin
15-0	R	0	counts for the 23rd bin

**VDIN1\_DNLP\_HIST12 0x1343**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 26th bin
15-0	R	0	counts for the 25th bin

**VDIN1\_DNLP\_HIST13 0x1344**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 28th bin
15-0	R	0	counts for the 27th bin

**VDIN1\_DNLP\_HIST14 0x1345**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 30th bin
15-0	R	0	counts for the 29th bin

**VDIN1\_DNLP\_HIST15 0x1346**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 32nd bin
15-0	R	0	counts for the 31st bin

**VDIN1\_DNLP\_HIST16 0x1347**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 34th bin
15-0	R	0	counts for the 33rd bin

**VDIN1\_DNLP\_HIST17 0x1348**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 36th bin
15-0	R	0	counts for the 35th bin

**VDIN1\_DNLP\_HIST18 0x1349**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 38th bin
15-0	R	0	counts for the 37th bin

**VDIN1\_DNLP\_HIST19 0x134a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 40th bin
15-0	R	0	counts for the 39th bin

**VDIN1\_DNLP\_HIST20 0x134b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 42nd bin
15-0	R	0	counts for the 41st bin

**VDIN1\_DNLP\_HIST21 0x134c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 44th bin
15-0	R	0	counts for the 43rd bin

**VDIN1\_DNLP\_HIST22 0x134d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 46th bin
15-0	R	0	counts for the 45th bin

**VDIN1\_DNLP\_HIST23 0x134e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31-16	R	0	counts for the 48th bin
15-0	R	0	counts for the 47th bin

**VDIN1\_DNLP\_HIST24 0x134f**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 50th bin
15-0	R	0	counts for the 49th bin

**VDIN1\_DNLP\_HIST25 0x1350**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 52nd bin
15-0	R	0	counts for the 51st bin

**VDIN1\_DNLP\_HIST26 0x1351**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 54th bin
15-0	R	0	counts for the 53rd bin

**VDIN1\_DNLP\_HIST27 0x1352**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 56th bin
15-0	R	0	counts for the 55th bin

**VDIN1\_DNLP\_HIST28 0x1353**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 58th bin
15-0	R	0	counts for the 57th bin

**VDIN1\_DNLP\_HIST29 0x1354**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 60th bin
15-0	R	0	counts for the 59th bin

**VDIN1\_DNLP\_HIST30 0x1355**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 62nd bin

15-0	R	0	counts for the 61st bin
------	---	---	-------------------------

**VDIN1\_DNLP\_HIST31 0x1356**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 64th bin
15-0	R	0	counts for the 63rd bin

**VDIN1\_LDIM\_STTS\_HIST\_REGION\_IDX 0x1357**

Bit(s)	R/W	Default	Description
31	R	0	local dimming max statistic enable
28	R	0	eol enable
27-25	R	0	vertical line overlap number for max finding
24-22	R	0	horizontal pixel overlap number, 0: 17 pix, 1: 9 pix, 2: 5 pix, 3: 3 pix, 4: 0 pix
20	R	0	1,2,1 low pass filter enable before max/hist statistic
19-16	R	0	region H/V position index, refer to VDIN_LDIM_STTS_HIST_SET_REGION
15	R	0	1: region read index auto increase per read to VDIN_LDIM_STTS_HIST_READ_REGION
6-0	R	0	region read index

**VDIN1\_LDIM\_STTS\_HIST\_READ\_REGION 0x1359**

Bit(s)	R/W	Default	Description
29:20	R	0	Max_comp2
19:10	R	0	Max_comp1
9:0	R	0	Max_comp0

**VDIN1\_MEAS\_CTRL0 0x135a**

Bit(s)	R/W	Default	Description
18	R/W	0	reset bit, high active
17	R/W	0	if true, widen hs/vs pulse
16	R/W	0	vsync total counter always accumulating enable
14-12	R/W	0	select hs/vs of video input channel to measure, 0: no selection, 1:vdi1, 2:vid2: 3:vid3, 4:vid4, 5:vdi5, 6:vdi6, 7:vdi7.
11-4	R/W	0	vsync_span, define how many vsync span need to measure

2-0	R/W	0	meas_hs_index, index to select which HS counter/range
-----	-----	---	---

**VDIN1\_MEAS\_VS\_COUNT\_HI 0x135b**

Bit(s)	R/W	Default	Description
19-16	R	0	meas_ind_total_count_n, every number of sync_span vsyncs, this count add 1
15-0	R	0	high bit portion of vsync total counter

**VDIN1\_MEAS\_VS\_COUNT\_LO 0x135c**

Bit(s)	R/W	Default	Description
31-0	R	0	low bit portion of vsync total counter

**VDIN1\_MEAS\_HS\_RANGE 0x135d**

//according to the meas\_hs\_index in register VDIN\_MEAS\_CTRL0

//meas\_hs\_index == 0, first hs range

//meas\_hs\_index == 1, second hs range

//meas\_hs\_index == 2, third hs range

//meas\_hs\_index == 3, fourth hs range

Bit(s)	R/W	Default	Description
28-16	R	0	count_start
12-0	R	0	count_end

**VDIN1\_MEAS\_HS\_COUNT 0x135e**

//according to the meas\_hs\_index in register VDIN\_MEAS\_CTRL0,

//meas\_hs\_index == 0, first range hs counter,

//meas\_hs\_index == 1, second range hs

//meas\_hs\_index == 2, third range hs

//meas\_hs\_index == 3, fourth range hs

Bit(s)	R/W	Default	Description
23-0	R	0	Hs counter

**VDIN1\_BLKBAR\_CTRL1 0x135f**

Bit(s)	R/W	Default	Description
8	R/W	0	white_enable
7-0	R/W	0	blkbar_white_level

**VDIN1\_BLKBAR\_CTRL0 0x1360**

Bit(s)	R/W	Default	Description
31-24	R/W	0	blkbar_black_level threshold to judge a black point

20-8	R/W	0	blkbar_hwidht left and right region width
7-5	R/W	0	blkbar_comp_sel select yin or uin or vin to be the valid input
4	R/W	0	blkbar_sw_statistic_en enable software statistic of each block black points number
3	R/W	0	blkbar_det_en
2-1	R/W	0	blkbar_din_sel
0	R/W	0	Blkbar_det_top_en

**VDIN1\_BLKBAR\_H\_START\_END 0x1361**

Bit(s)	R/W	Default	Description
28-16	R/W	0	blkbar_hstart. Left region start
12-0	R/W	0	blkbar_hend. Right region end

**VDIN1\_BLKBAR\_V\_START\_END 0x1362**

Bit(s)	R/W	Default	Description
28-16	R/W	0	blkbar_vstart.
12-0	R/W	0	blkbar_vend.

**VDIN1\_BLKBAR\_CNT\_THRESHOLD 0x1363**

Bit(s)	R/W	Default	Description
19-0	R/W	0	blkbar_cnt_threshold. threshold to judge whether a block is totally black

**VDIN1\_BLKBAR\_ROW\_TH1\_TH2 0x1364**

Bit(s)	R/W	Default	Description
28-16	R/W	0	blkbar_row_th1. //threshold of the top blackbar
12-0	R/W	0	blkbar_row_th2 //threshold of the bottom blackbar

**VDIN1\_BLKBAR\_IND\_LEFT\_START\_END 0x1365**

Bit(s)	R/W	Default	Description
28-16	R	0	blkbar_ind_left_start. horizontal start of the left region in the current searching
12-0	R	0	blkbar_ind_left_end. horizontal end of the left region in the current searching

**VDIN1\_BLKBAR\_IND\_RIGHT\_START\_END 0x1366**

Bit(s)	R/W	Default	Description
28-16	R	0	blkbar_ind_right_start. horizontal start of the right region in the current searching
12-0	R	0	blkbar_ind_right_end. horizontal end of the right region in the current searching

**VDIN1\_BLKBAR\_IND\_LEFT1\_CNT 0x1367**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_left1_cnt. Black pixel counter. left part of the left region

**VDIN1\_BLKBAR\_IND\_LEFT2\_CNT 0x1368**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_left2_cnt. Black pixel counter. right part of the left region

**VDIN1\_BLKBAR\_IND\_RIGHT1\_CNT 0x1369**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_right1_cnt. Black pixel counter. left part of the right region

**VDIN1\_BLKBAR\_IND\_RIGHT2\_CNT 0x136a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19-0	R	0	blkbar_ind_right2_cnt. Black pixel counter. right part of the right region

**VDIN1\_BLKBAR\_STATUS0 0x136b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29	R	0	blkbar_ind_black_det_done. LEFT/RIGHT Black detection done
28-16	R	0	blkbar_top_pos. Top black bar position
12-0	R	0	blkbar_bot_pos. Bottom black bar position

**VDIN1\_BLKBAR\_STATUS1 0x136c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R	0	blkbar_left_pos. Left black bar position
12-0	R	0	blkbar_right_pos. Right black bar position

**VDIN1\_WIN\_H\_START\_END 0x136d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	input window H start
12-0	R/W	0	input window H end

**VDIN1\_WIN\_V\_START\_END 0x136e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	input window V start
12-0	R/W	0	input window V end

**VDIN1 ASFIFO\_CTRL3 0x136f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R/W	0	Vdi7 DE enable
14	R/W	0	Vdi7 go field enable
13	R/W	0	Vdi7 go line enable
12	R/W	0	Vdi7 if true, negative active input vsync
11	R/W	0	Vdi7 if true, negative active input hsync
10	R/W	0	Vdi7 vsync soft reset fifo enable
9	R/W	0	Vdi7 overflow status clear
8	R/W	0	Vdi7 asfifo soft reset, level signal
7	R/W	0	Vdi6 DE enable
6	R/W	0	Vdi6 go field enable
5	R/W	0	Vdi6 go line enable
4	R/W	0	Vdi6 if true, negative active input vsync
3	R/W	0	Vdi6 if true, negative active input hsync
2	R/W	0	Vdi6 vsync soft reset fifo enable
1	R/W	0	Vdi6 overflow status clear
0	R/W	0	Vdi6 asfifo soft reset, level signal

**VDIN1 COM\_GCLK\_CTRL2 0x1370**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
3-2	R/W	0	Vshrk_clk2 ctrl
1-0	R/W	0	Vshrk_clk1 ctrl

**VDIN1\_VSHRK\_CTRL 0x1371**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27	R/W	0	Vshrk enable
26:25	R/W	0	Vshrk mode, 0: 1/2 shrink, 1: 1/4 shrink, 2: 1/8 shrink
24	R/W	0	Vshrink lpf mode, 1: 0.5,1.5,1.5,0.5 lpf for 1/4 shrink, 0.5,1.5,1.5...for 1/8 shrink
23:0	R/W	0	Vshrink padding dummy data

**VDIN1\_HIST32 0x1372**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31:0	R	0	Hist 32 mode, [31:16] for white pixel number, 15:0 for black pixel number
------	---	---	---

**VDIN1\_COM\_STATUS3 0x133**

Bit(s)	R/W	Default	Description
7	R	0	Vdi9 fifo overflow
5:0	R	0	Vdi9 asfifo cnt

**VI\_HIST\_CTRL 0x2e00**

Bit(s)	R/W	Default	Description
17-16	R/W	0	Spl_sft: the splt are right shift by spl_sft, 0: no shift, 1: right shift by 1. 2,3...
14	R/W	0	Hist_34bin_only, bin 32~63 are not valid, there are 34bins, bin0~bin31, and bin 64 for black pixel, bin 65 for white pixel
13-11	R/W	0	Hist_in_sel: 0: vpp_dout, 1: vpp_vd1_din, 2: vpp_vd2_din, 3: osd1, 4:osd2 5: di pre 6: vdin 7: post blend
10-8	R/W	0	Hist_din_comp_mux: mux of each component, din[9:0],[19:10],[29:20] switches
7-5	R/W	0	Hist_dnlp_low: hist number are shift by (hist_dnlp_low + 3). I.e. Dnlp_low =0, >> 3, dnlp_low=1, >> 4
1	R/W	0	Hist_win_en: hist statistic in a window
0	R/W	0	Luma_hist_spl_en, 1: enable the histogram statistic

**VI\_HIST\_H\_START\_END 0x2e01**

Bit(s)	R/W	Default	Description
28-16	R/W	0	Hist_hstart, refer to VI_HIST_CTRL[1]
12-0	R/W	0	Hist_hend

**VI\_HIST\_V\_START\_END 0x2e02**

Bit(s)	R/W	Default	Description
28-16	R/W	0	Hist_vstart, refer to VI_HIST_CTRL[1]
12-0	R/W	0	Hist vend

**VI\_HIST\_MAX\_MIN 0x2e03**

Bit(s)	R/W	Default	Description
15-8	R	0	hist_max maximum value
7-0	R	0	hist_min minimum value

**VI\_HIST\_SPL\_VAL 0x2e04**

Bit(s)	R/W	Default	Description
--------	-----	---------	-------------

31-0	R	0	hist_spl_rd , counts for the total luma value
------	---	---	---

**VI\_HIST\_SPL\_PIX\_CNT 0x2e05**

Bit(s)	R/W	Default	Description
21-0	R	0	hist_spl_pixel_count, counts for the total calculated pixels

**VI\_HIST\_CHROMA\_SUM 0x2e06**

Bit(s)	R/W	Default	Description
31-0	R	0	hist_chroma_sum , counts for the total chroma value

**VI\_DNLP\_HIST00 0x2e07**

//0-255 are splitted to 64 bins evenly, and VDIN\_DNLP\_HISTXX

//are the statistic number of pixels that within each bin.

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 2nd bin
15-0	R	0	counts for the 1st bin

**VI\_DNLP\_HIST01 0x2e08**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 4th bin
15-0	R	0	counts for the 3rd bin

**VI\_DNLP\_HIST02 0x2e09**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 6th bin
15-0	R	0	counts for the 5th bin

**VI\_DNLP\_HIST03 0x2e0a**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 8th bin
15-0	R	0	counts for the 7th bin

**VI\_DNLP\_HIST04 0x2e0b**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 10th bin
15-0	R	0	counts for the 9th bin

**VI\_DNLP\_HIST05 0x2e0c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 12th bin
15-0	R	0	counts for the 11th bin

**VI\_DNLP\_HIST06 0x2e0d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 14th bin
15-0	R	0	counts for the 13th bin

**VI\_DNLP\_HIST07 0x2e0e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 16th bin
15-0	R	0	counts for the 15th bin

**VI\_DNLP\_HIST08 0x2e0f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 18th bin
15-0	R	0	counts for the 17th bin

**VI\_DNLP\_HIST09 0x2e10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 20th bin
15-0	R	0	counts for the 19th bin

**VI\_DNLP\_HIST10 0x2e11**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 22nd bin
15-0	R	0	counts for the 21st bin

**VI\_DNLP\_HIST11 0x2e12**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 24th bin
15-0	R	0	counts for the 23rd bin

**VI\_DNLP\_HIST12 0x2e13**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31-16	R	0	counts for the 26th bin
15-0	R	0	counts for the 25th bin

**VI\_DNLP\_HIST13 0x2e14**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 28th bin
15-0	R	0	counts for the 27th bin

**VI\_DNLP\_HIST14 0x2e15**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 30th bin
15-0	R	0	counts for the 29th bin

**VI\_DNLP\_HIST15 0x2e16**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 32nd bin
15-0	R	0	counts for the 31st bin

**VI\_DNLP\_HIST16 0x2e17**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 34th bin
15-0	R	0	counts for the 33rd bin

**VI\_DNLP\_HIST17 0x2e18**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 36th bin
15-0	R	0	counts for the 35th bin

**VI\_DNLP\_HIST18 0x2e19**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 38th bin
15-0	R	0	counts for the 37th bin

**VI\_DNLP\_HIST19 0x2e1a**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 40th bin

15-0	R	0	counts for the 39th bin
------	---	---	-------------------------

**VI\_DNLP\_HIST20 0x2e1b**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 42nd bin
15-0	R	0	counts for the 41st bin

**VI\_DNLP\_HIST21 0x2e1c**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 44th bin
15-0	R	0	counts for the 43rd bin

**VI\_DNLP\_HIST22 0x2e1d**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 46th bin
15-0	R	0	counts for the 45th bin

**VI\_DNLP\_HIST23 0x2e1e**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 48th bin
15-0	R	0	counts for the 47th bin

**VI\_DNLP\_HIST24 0x2e1f**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 50th bin
15-0	R	0	counts for the 49th bin

**VI\_DNLP\_HIST25 0x2e20**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 52nd bin
15-0	R	0	counts for the 51st bin

**VI\_DNLP\_HIST26 0x2e21**

Bit(s)	R/W	Default	Description
31-16	R	0	counts for the 54th bin
15-0	R	0	counts for the 53rd bin

**VI\_DNLP\_HIST27 0x2e22**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 56th bin
15-0	R	0	counts for the 55th bin

**VI\_DNLP\_HIST28 0x2e23**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 58th bin
15-0	R	0	counts for the 57th bin

**VI\_DNLP\_HIST29 0x2e24**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 60th bin
15-0	R	0	counts for the 59th bin

**VI\_DNLP\_HIST30 0x2e25**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 62nd bin
15-0	R	0	counts for the 61st bin

**VI\_DNLP\_HIST31 0x2e26**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 64th bin
15-0	R	0	counts for the 63rd bin

**VI\_DNLP\_HIST31 0x2e27**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	counts for the 66th bin, for white pix
15-0	R	0	counts for the 65th bin, for black pix

**VI\_HIST\_PIC\_SIZE 0x2e28**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
28-16	R/W	0	Hist_pic_height
12-0	R/W	0	Hist_pic_width

**VI\_HIST\_GCLK\_CTRL 0x2e2a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

5-4	R/W	0	Gated clock control of hist_clk
3-2	R/W	0	Gated clock control of clk0
1-0	R/W	0	Gated clock control of hist register clock

### 10.2.3.43 HDMITX Top-Level and HDMI TX Controller IP Register Access

Accessing HDMITX Top-Level and TX Controller IP registers is by directly accessing memory addresses. Due to the difference between the data width of Top-level register and IP register – Top-level 4-byte wide and IP register 1-byte wide, below list the correct ways to access Top-level and IP registers.

#### To access Top-level registers:

```
#define HDMITX_TOP_BASE_OFFSET          0xff608000
#define HDMITX_TOP_REVOCMEM_ADDR_S       0x2000
#define HDMITX_TOP_REVOCMEM_ADDR_E       0x365E
void hdmitx_wr_only_TOP (uint32_t addr, uint32_t data) {
    if ((addr >= HDMITX_TOP_REVOCMEM_ADDR_S) &&
        (addr <= HDMITX_TOP_REVOCMEM_ADDR_E)) {
        *(volatile uint8_t *) (HDMITX_TOP_BASE_OFFSET+addr) = (uint8_t)(data&0xff);
    } else {
        *(volatile uint32_t *) (HDMITX_TOP_BASE_OFFSET+addr) = (data);
    }
}
uint32_t hdmitx_rd_TOP (uint32_t addr) {
    uint32_t data;
    if ((addr >= HDMITX_TOP_REVOCMEM_ADDR_S) &&
        (addr <= HDMITX_TOP_REVOCMEM_ADDR_E)) {
        data = (uint32_t) (*(volatile uint8_t *) (HDMITX_TOP_BASE_OFFSET+addr));
    } else {
        data = *(volatile uint32_t *) (HDMITX_TOP_BASE_OFFSET+addr);
    }
    return (data);
}
```

### 10.2.3.44 HDCP2.2 IP Register Access

Table 10-1 HDCP2.2 IP register base address

Absolute Address	Address Mnemonic	Description
0xffe01000	ELP_ESM_HPI_REG_BASE	Address base to HDCP2.2 IP register access.

To write to an HDCP2.2 IP register:

```
*((volatile uint32_t *) (ELP_ESM_HPI_REG_BASE+addr)) = data;
```

To read from an HDCP2.2 IP register:

```
data = *((volatile uint32_t *) (ELP_ESM_HPI_REG_BASE+addr));
```

**Table 10-2 HDMI TX Top-Level Registers**

Addr	Name	RW	Function
0x000<<2	HDMITX_TOP_SW_RESET	RW	Software reset sub-modules.
0x001<<2	HDMITX_TOP_CLK_CNTL	RW	Clock gating and inversion.
0x002<<2	HDMITX_TOP_HPD_FILTER	RW	HPD and RxSense input glitch filter.
0x003<<2	HDMITX_TOP_INTR_MASKN	RW	Interrupt mask.
0x004<<2	HDMITX_TOP_INTR_STAT	RW	Interrupt status.
0x005<<2	HDMITX_TOP_INTR_STAT_CLR	W	Interrupt clear.
0x006<<2	HDMITX_TOP_BIST_CNTL	RW	Build-In Self Test(BIST) control.
0x007<<2	HDMITX_TOP_SHIFT_PTTN_012	RW	Shift pattern for BIST.
0x008<<2	HDMITX_TOP_SHIFT_PTTN_345	RW	Shift pattern for BIST.
0x009<<2	HDMITX_TOP_SHIFT_PTTN_67	RW	Shift pattern for BIST.
0x00A<<2	HDMITX_TOP_TMDS_CLK_PTTN_01	RW	TMDS clock pattern for generating /10 or /40 rate clock.
0x00B<<2	HDMITX_TOP_TMDS_CLK_PTTN_23	RW	TMDS clock pattern for generating /10 or /40 rate clock.
0x00C<<2	HDMITX_TOP_TMDS_CLK_PTTN_CNTL	RW	TMDS clock pattern for generating /10 or /40 rate clock.
0x00D<<2	HDMITX_TOP_REVOCMEM_STAT	RW	Revocmem status
0x00E<<2	HDMITX_TOP_STAT0	RW	Status.
0x010<<2	HDMITX_TOP_SKP_CNTL_STAT	RW	SKP interface control for HDCP2.2.
0x011<<2	HDMITX_TOP_NONCE_0	W	Nonce[31:0] for HDCP2.2.
0x012<<2	HDMITX_TOP_NONCE_1	W	Nonce[63:32] for HDCP2.2.
0x013<<2	HDMITX_TOP_NONCE_2	W	Nonce[95:64] for HDCP2.2.
0x014<<2	HDMITX_TOP_NONCE_3	W	Nonce[127:96] for HDCP2.2.
0x015<<2	HDMITX_TOP_PKF_0	W	PKF[31:0] for HDCP2.2.
0x016<<2	HDMITX_TOP_PKF_1	W	PKF[63:32] for HDCP2.2.
0x017<<2	HDMITX_TOP_PKF_2	W	PKF[95:64] for HDCP2.2.
0x018<<2	HDMITX_TOP_PKF_3	W	PKF[127:96] for HDCP2.2.
0x019<<2	HDMITX_TOP_DUK_0	W	DUK [31:0] for HDCP2.2.

Addr	Name	RW	Function
0x01A<<2	HDMITX_TOP_DUK_1	W	DUK [63:32] for HDCP2.2.
0x01B<<2	HDMITX_TOP_DUK_2	W	DUK [95:64] for HDCP2.2.
0x01C<<2	HDMITX_TOP_DUK_3	W	DUK [127:96] for HDCP2.2.
0x01D<<2	HDMITX_TOP_INFILTER	RW	DDC and CEC input glitch filter control.
0x01E<<2	HDMITX_TOP_NSEC_SCRATCH	RW	Scratch register for non-secure access.
0x01F<<2	HDMITX_TOP_SEC_SCRATCH	RW	Scratch register for secure access.
0x020<<2	HDMITX_TOP_EMP_CNTL0	RW	EMP control.
0x021<<2	HDMITX_TOP_EMP_CNTL1	RW	EMP control.
0x022<<2	HDMITX_TOP_EMP_MEMADDR_START	RW	Mem addr pointer for EMP.
0x023<<2	HDMITX_TOP_EMP_STAT0	R	EMP status.
0x024<<2	HDMITX_TOP_EMP_STAT1	R	EMP status.
0x025<<2	HDMITX_TOP_AXI_ASYNC_CNTL0	RW	AXI async control.
0x026<<2	HDMITX_TOP_AXI_ASYNC_CNTL1	RW	AXI async control.
0x027<<2	HDMITX_TOP_AXI_ASYNC_STAT0	R	AXI async status.
0x028<<2	HDMITX_TOP_I2C_BUSY_CNT_MAX	RW	Max I2C idle time after I2C Start.
0x029<<2	HDMITX_TOP_I2C_BUSY_CNT_STAT	RW	I2C idle time status.
0x02A<<2	HDMITX_TOP_HDCP22_BSOD	RW	HDCP22 BSOD override control.
0x02B<<2	HDMITX_TOP_DDC_CNTL	RW	DDC pull down by SW.
0x2000	HDMITX_TOP_REVOCMEM_ADDR_S	RW	Map to third party's IP internal Revoc MEM start address.
0x365E	HDMITX_TOP_REVOCMEM_ADDR_E	RW	Map to third party's IP internal Revoc MEM end address.

**HDMITX\_TOP\_SW\_RESET**

Bit	R/W	Default	Description
31:8	R	0	Reserved
15:10	RW	0x3f	Reserved
9	RW	0	sw_reset_i2c: to reset DWC IP's I2C module. 0=Release from reset; 1=Apply reset.

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8	RW	1	sw_reset_axiarb: to reset AXI arbiter between HDCP22 and EMP. 0=Release from reset; 1=Apply reset.
7	RW	1	sw_reset_emp: to reset EMP block. 0=Release from reset; 1=Apply reset.
6	RW	1	sw_reset_flt: to reset DDC&CEC input glitch filter. 0=Release from reset; 1=Apply reset.
5	RW	1	sw_reset_hdcp22: to reset HDCP2.2 IP. 0=Release from reset; 1=Apply reset.
4	RW	1	sw_reset_phyif: to reset PHY interface. 0=Release from reset; 1=Apply reset.
3	RW	1	sw_reset_intr: to reset interrupt block. 0=Release from reset; 1=Apply reset.
2	RW	1	sw_reset_mem: to reset KSV/REVOC mem. 0=Release from reset; 1=Apply reset.
1	RW	1	sw_reset_rnd: to reset random number interface to HDCP. 0=Release from reset; 1=Apply reset.
0	RW	1	sw_reset_core: To reset TX Controller IP. 0=Release from reset; 1=Apply reset.

**HDMITX\_TOP\_CLK\_CNTL**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	RW	0	free_clk_en: 0= Enable clock gating for power saving; 1= Disable clock gating, enable free-run clock.
30:13	RW	0	Reserved
12	RW	0	i2s_ws_inv: 1= Invert i2s_ws.

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11	RW	0	i2s_clk_inv: 1= Invert i2s_clk.
10	RW	0	spdif_clk_inv: 1= Invert spdif_clk.
9	RW	0	tmds_clk_inv: 1= Invert tmds_clk.
8	RW	0	pixel_clk_inv: 1= Invert pixel_clk.
7	RW	0	hdcp22_skpclk_en: 1= Enable skpclk to HTX_HDCP2.2 IP.
6	RW	0	hdcp22_esmclk_en: 1= Enable esmclk to HTX_HDCP2.2 IP.
5	RW	0	hdcp22_tmdsclk_en: 1= Enable tmds_clk to HDCP2.2 IP.
4	RW	0	Reserved.
3	RW	0	i2s_clk_en: 1= Enable i2s_clk.
2	RW	0	spdif_clk_en: 1= Enable spdif_clk.
1	RW	0	tmds_clk_en: 1= Enable tmds_clk.
0	RW	0	pixel_clk_en: 1= Enable pixel_clk.

**HDMITX\_TOP\_HPD\_FILTER**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R	0	Reserved
31:28	RW	0	rxsense_glitch_width: Filter out glitch <= rxsense_glitch_width.
27:16	RW	0	rxsense_valid_width: Filter out width <= rxsense_valid_width * 1024.
15:12	RW	0	hpd_glitch_width: Filter out glitch <= hpd_glitch_width.

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11:0	RW	0	hpd_valid_width: Filter out width <= hpd_valid_width * 1024.

**HDMITX\_TOP\_INTR\_MASKN**

Interrupt MASKN, one bit per interrupt source.

0= Disable interrupt source;

1= Enable interrupt source.

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:8	R	0	Reserved
7	RW	0	rxsense_fall
6	RW	0	rxsense_rise
5	RW	0	err_i2c_timeout
4	RW	0	hdcp22_rndnum_err
3	RW	0	nonce_rfrsh_rise
2	RW	0	hpd_fall
1	RW	0	hpd_rise
0	RW	0	TX Controller IP interrupt.

**HDMITX\_TOP\_INTR\_STAT**

Interrupt status. For each bit of bit[4:0], write 1 to manually set the interrupt bit, read back the interrupt status.

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0	Shadowing TX Controller IP interrupt status flag.
30	R	0	Shadowing HDCP2.2 IP interrupt status flag.
29:58	R	0	Reserved
7	RW	0	rxsense_fall
6	RW	0	rxsense_rise
5	RW	0	err_i2c_timeout
4	RW	0	hdcp22_rndnum_err
3	RW	0	nonce_rfrsh_rise
2	RW	0	hpd_fall
1	RW	0	hpd_rise

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0	RW	0	TX Controller IP interrupt.

**HDMITX\_TOP\_INTR\_STAT\_CLR**

Interrupt status clear. For each bit, write 1 to clear the interrupt bit.

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31: 58	R	0	Reserved
7	W	0	rxsense_fall
6	W	0	rxsense_rise
5	W	0	err_i2c_timeout
4	W	0	hdcp22_rndnum_err
3	W	0	nonce_rfrsh_rise
2	W	0	hpd_fall
1	W	0	hpd_rise
0	W	0	TX Controller IP interrupt.

**HDMITX\_TOP\_BIST\_CNTL**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R	0	Reserved
15	RW	0	Reserved
14:12	RW	0	tmds_sel: 3'b000=Output zero; 3'b001=Output normal TMDS data; 3'b010=Output PRBS data; 3'b100=Output shift pattern.
11: 9	RW	0	shift_pttn_repeat: 0>New pattern every clk cycle; 1>New pattern every 2 clk cycles; ...; 7>New pattern every 8 clk cycles.
8	RW	0	shift_pttn_en: 1= Eanble shift pattern generator; 0=Disable.
7:5	RW	0	Reserved
4: 3	RW	0	prbs_pttn_mode:

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			0=PRBS11; 1=PRBS15; 2=PRBS7; 3=PRBS31.
2:1	RW	0	prbs_pttn_width: 0=Idle; 1=Output 8-bit pattern; 2=Output 1-bit pattern; 3=Output 10-bit pattern.
0	RW	0	prbs_pttn_en: 1=Enable PRBS generator; 0=Disable.

**HDMITX\_TOP\_SHIFT\_PTTN\_012**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R	0	Reserved
29:20	RW	0	shift_pttn_data[59:50].
19:10	RW	0	shift_pttn_data[69:60].
9:0	RW	0	shift_pttn_data[79:70].

**HDMITX\_TOP\_SHIFT\_PTTN\_345**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R	0	Reserved
29:20	RW	0	shift_pttn_data[29:20].
19:10	RW	0	shift_pttn_data[39:30].
9:0	RW	0	shift_pttn_data[49:40].

**HDMITX\_TOP\_SHIFT\_PTTN\_67**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20	R	0	Reserved
19:10	RW	0	shift_pttn_data[9:0].
9:0	RW	0	shift_pttn_data[19:10].

**HDMITX\_TOP\_TMDS\_CLK\_PTTN\_01**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31:26	R	0	Reserved
25:16	RW	0	tmds_clk_pttn[19:10].
15:10	R	0	Reserved
9:0	RW	0	tmds_clk_pttn[9:0].

**HDMITX\_TOP\_TMDS\_CLK\_PTTN\_23**

Bit	R/W	Default	Description
31:26	R	0	Reserved
25:16	RW	0	tmds_clk_pttn[39:30].
15:10	R	0	Reserved
9:0	RW	0	tmds_clk_pttn[29:20].

**HDMITX\_TOP\_TMDS\_CLK\_PTTN\_CNTL**

Bit	R/W	Default	Description
31:2	R	0	Reserved
1	RW	0	shift_tmds_clk_pttn: 1=Enable shifting clk pattern, used when TMDS CLK rate = TMDS character rate /4.
0	W	0	load_tmds_clk_pttn: Write this bit to 1 to load tmds_clk_pttn to HW. Always read back 0.

**HDMITX\_TOP\_REVOCMEM\_STAT**

Bit	R/W	Default	Description
31:12	R	0	Reserved
1	RW	0	revocmem_rd_fail: Read back 1 to indicate Host read REVOC MEM failure, Reading this register automatically clear the failure flag.
0	RW	0	revocmem_wr_fail: Read back 1 to indicate Host write REVOC MEM failure, Reading this register automatically clear the failure flag.

**HDMITX\_TOP\_STAT0**

Bit	R/W	Default	Description
31: 12	R	0	Reserved
1	R	0	filtered RxSense status: 0= RxSense low; 1= RxSense high.

0	R	0	filtered HPD status: 0= HPD low; 1= HPD high.
---	---	---	---

**HDMITX\_TOP\_SKP\_CNTL\_STAT**

Bit	R/W	Default	Description
31	R	0	Status of nonce_vld signal.
30:4	R	0	Reserved
3	RW	0	rndnum_hdcp22: 0=Randon number generator if enabled for hdcp1.4; 1= Randon number generator if enabled for hdcp2.2.
2	RW	0	DUK_vld:Set to 1 once DUK is written.
1	RW	0	PKF_vld:Set to 1 once PKF is written.
0	RW	0	nonce_hw_en: 1=Use HW nonce; 0=Use SW nonce from reg HDMITX_TOP_NONCE_0/1/2/3.

**HDMITX\_TOP\_NONCE\_0**

Bit	R/W	Default	Description
31:0	W	0	nonce[31:0]

**HDMITX\_TOP\_NONCE\_1**

Bit	R/W	Default	Description
31:0	W	0	nonce[63:32]

**HDMITX\_TOP\_NONCE\_2**

Bit	R/W	Default	Description
31:0	W	0	nonce[95:64]

**HDMITX\_TOP\_NONCE\_3**

Bit	R/W	Default	Description
31:0	W	0	nonce[127:96]

**HDMITX\_TOP\_PKF\_0**

Bit	R/W	Default	Description
31:0	W	0	PKF[31:0]

**HDMITX\_TOP\_PKF\_1**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	W	0	PKF[63:32]

**HDMITX\_TOP\_PKF\_2**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	W	0	PKF[95:64]

**HDMITX\_TOP\_PKF\_3**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	W	0	PKF[127:96]

**HDMITX\_TOP\_DUK\_0**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	W	0	DUK[31:0]

**HDMITX\_TOP\_DUK\_1**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	W	0	DUK[63:32]

**HDMITX\_TOP\_DUK\_2**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	W	0	DUK[95:64]

**HDMITX\_TOP\_DUK\_3**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	W	0	DUK[127:96]

**HDMITX\_TOP\_INFILTER**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:27	RW	0	Reserved
26:24	RW	0	For DDC infilter: filter internal clock divider. 0=No divide; 1=Divide by 2; 2=Divide by 3; ... 7=Divide by 8.

23:16	RW	0	For DDC infilter: sampling clock divider. 0=No divide; 1=Divide the filter sampling clock by 2; 2=Divide the filter sampling clock by 3; ... 255=Divide the filter sampling clock by 256;
15:11	RW	0	Reserved

**HDMITX\_TOP\_NSEC\_SCRATCH**

Bit	R/W	Default	Description
31:0	RW	0	Scratch register that can be used for either secure or non-secure reg access.

**HDMITX\_TOP\_SEC\_SCRATCH**

Bit	R/W	Default	Description
31:0	RW	0	Scratch register that can be used for secure reg access only.

**HDMITX\_TOP\_EMP\_CNTL0**

Bit	R/W	Default	Description
31:16	RW	0	Empacketsinframe. Number of EMPs to send for the next frame.
15:8	RW	0	Empstartlatency. Defines the number of lines to wait after End-Of-Field, to start sending EMP.
0	RW	0	emp_tx_en. 0=Disable Extended Metadata packet. 1=Enable Extended Metadata packet.

**HDMITX\_TOP\_EMP\_CNTL1**

Bit	R/W	Default	Description
31:19	R	0	Reserved.
18:17	RW	0	emp_endian[1:0]. Bit[0]: 1=EMP data are stored as little Endian in DDR per 64-bit. 0=Big endian. Bit[1]: 1=For each 128-bit, swap high 64-bit to low 64-bit, and low 64-bit to high 64-bit. 0>No swap.

16	RW	0	<p>emp_autoclr_ar_pending.</p> <p>If at the start of DDR read request for the current frame, there is still outstanding requests remaining from the previous frame, this bit defines whether to auto-clear DDR request state machine.</p> <p>0=The current request will not start until the previous outstanding requests are cleared by normal operation.</p> <p>1=The state machine is reset and previous outstanding requests are cancelled. The current request starts immediately.</p>
15:0	RW	128	<p>emp_sampleline.</p> <p>All EMP control registers are buffered internally, at the time defined by this field – the number of lines after Vsync rise. Before this time the EMP control registers does not take effect.</p>

**HDMITX\_TOP\_EMP\_MEMADDR\_START**

Bit	R/W	Default	Description
31:0	RW	0	Start address of EMP memory pointer for next frame.

**HDMITX\_TOP\_EMP\_STAT0**

Bit	R/W	Default	Description
31:30	RW	0	<p>emp_err[1:0]. Error status of AXI activity. Write 1 to each bit to clear.</p> <p>Bit[0]: 1=AXI RID incorrect.</p> <p>Bit[1]: 1=AXI RRESP error.</p>
29:27	R	0	Reserved.
26:24	R	0	<p>emp_ar_state[2:0]: Status of DDR AXI Address Read state machine.</p> <p>0=IDLE;</p> <p>1=WAIT_FIFO_ROOM;</p> <p>2=WAIT_ARREADY;</p> <p>3=WAIT_PENDING;</p> <p>4=DONE.</p>
23:17	R	0	<p>emp_fifo_count[6:0].</p> <p>FIFO fill level for storing 128-bit DDR data, the result of reading EMP data from DDR.</p>
16:0	R	0	<p>emp_ar_pending.</p> <p>Number of DDR reads that are still outstanding, meaning request has been sent, but Data have yet to be received.</p>

**HDMITX\_TOP\_EMP\_STAT1**

Bit	R/W	Default	Description
31:16	R	0	empdone_cnt_buf [15:0]: Buffered number of EMP sent.
15:0	R	0	empdone_cnt[15:0]: Current number of EMP sent.

**HDMITX\_TOP\_AXI\_ASYNC\_CNTL0**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R	0	Reserved.
15:8	RW	128	axi_async_waiting_limit[7:0].
7:5	R	0	Reserved.
4:3	RW	0	axi_urgent[1:0]: DDR request urgent level.
2	RW	0	axi_async_disable_clk. 1=Disable clk to AXI-async module. 0=Enable clk.
1	RW	1	axi_async_auto_gclk_en. 1=Auto clk gate AXI-async module. 0=Free-run clk.
0	RW	1	axi_async_req_en. 1=Enable AXI async interface between EMP's tmds_clk domain to AXI's esm_clk domain. If need to sent EMP, this bit must be enabled. 0=Disable.

**HDMITX\_TOP\_AXI\_ASYNC\_CNTL1**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	32'h18101810	axi_async_hold_num.

**HDMITX\_TOP\_AXI\_ASYNC\_STAT0**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1	R	0	Reserved.
0	RW	1	axi_async_chan_idle.

**HDMITX\_TOP\_I2C\_BUSY\_CNT\_MAX**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0xffffffff	i2c_busy_cnt_max. After I2C Start bit, if I2C bus is static for more than i2c_busy_cnt_max number of cycles, an error interrupt will happen.

**HDMITX\_TOP\_I2C\_BUSY\_CNT\_STAT**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R	0	i2c_busy_cnt. Reflect the number of idle cycles after the I2C Start bit, for the latest I2C transaction.

**HDMITX\_TOP\_HDCP22\_BSOD**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26	R	0	Reserved.
25	RW	0	hdcp22_no_bsod. 1=Do not use BSOD to override, no matter from FW or SW. 0=Use the BSOD, original behaviour.
24	RW	0	hdcp22_bsod_override. 1=Override BSOD value with hdcp_bsod_val. 0=Use the original BSOD value from ESM FW.
23:0	RW	0x800080	hdcp22_bsod_val.

**HDMITX\_TOP\_DDC\_CNTL**

<b>Bit</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:2	R	0	Reserved.
1	RW	1	DSDA pull down. 0=Pull down DSDA. 1=No pull down.
0	RW	1	DSCL pull down. 0=Pull down DSCL. 1=No pull down.

**Controller Register Updates**

The following are the additional updates added to the original Controller. Please read the following in combination with the original databook of the Controller.

Note: DRM stands for Dynamic Range and Mastering InfoFrame.

Added a\_hdcpcfg1 bit[5] and hdcp22reg\_ctrl bit[7:6] to optional balance path delays between HDCP22 path, HDCP14 path and non-HDCP path.

Add EMP related register bits.

Add I2C reset.

**ih\_fc\_stat2 0x102**

<b>Bits</b>	<b>Name</b>	<b>Memory Access</b>	<b>Description</b>
3	EMP	RW	Active after successful transmission of a total of N packets through DDR-EMP interface. N is programmed by HDMITX_TOP_EMP_CNTL0[31:16]. Value After Reset: 0
2	DRM	RW	Active after successful transmission of an DRM InfoFrame packet. Value After Reset: 0

**ih\_mute\_fc\_stat2 0x182**

Bits	Name	MemoryAccess	Description
3	EMP	RW	When set to 1, mutes ih_fc_stat2[3]. Value After Reset: 1
2	DRM	RW	When set to 1, mutes ih_fc_stat2[2]. Value After Reset: 1

**fc\_datauto3 0x10b7**

Bits	Name	MemoryAccess	Description
6	DRM_auto	RW	Enables DRM packet insertion Value After Reset: 1

**fc\_rdrb12 0x10c4**

Bits	Name	MemoryAccess	Description
7:4	Reserved.		
3:0	DRMframeinterpolation	RW	DRM frame interpolation Value After Reset: 0

**fc\_rdrb13 0x10c5**

Bits	Name	Memory Access	Description
7:4	DRMpacketsinframe	RW	DRM packets per frame Value After Reset: 0
3:0	DRMpacketlinespacing	RW	DRM packets line spacing Value After Reset: 0

**fc\_mask2 0x10da**

Bits	Name	Memory Access	Description
3	EMP	RW	Mask bit for FC_INT2.EMP interrupt bit Value After Reset: 1

**MIPI\_DSI\_PHY\_CTRL[31:0] 0x00**

Bit(s)	R/W	Default	Description
31	R/W	0	soft reset for the phy. 1 = reset. 0 = dessert the reset.
30	R/W	0	clock lane soft reset.

29	R/W	0	data byte lane 3 soft reset.
28	R/W	0	data byte lane 2 soft reset.
27	R/W	0	data byte lane 1 soft reset.
26	R/W	0	data byte lane 0 soft reset.
5	R/W	0	LPDT data endian. 1 = transfer the high bit first. 0 : transfer the low bit first.
4	R/W	0	HS data endian.
3	R/W	0	force data byte lane in stop mode.
2	R/W	0	force data byte lane 0 in receiver mode.
1	R/W	0	write 1 to sync the txclkesc input. the internal logic have to use txclkesc to decide Txvalid and Txready.
0	R/W	0	enable the MIPI DSI PHY TxDDRClk.

**MIPI\_DSI\_PHY\_CTRL[31:0] 0x01**

Bit(s)	R/W	Default	Description
31	R/W	0	clk lane tx_hs_en control selection. 1 = from register. 0 use clk lane state machine.
30	R/W	0	register bit for clock lane tx_hs_en.
29	R/W	0	clk lane tx_lp_en control selection. 1 = from register. 0 from clk lane state machine.
28	R/W	0	register bit for clock lane tx_lp_en.
27	R/W	0	chan0 tx_hs_en control selection. 1 = from register. 0 from chan0 state machine.
26	R/W	0	register bit for chan0 tx_hs_en.
25	R/W	0	chan0 tx_lp_en control selection. 1 = from register. 0 from chan0 state machine.
24	R/W	0	register bit from chan0 tx_lp_en.
23	R/W	0	chan0 rx_lp_en control selection. 1 = from register. 0 from chan0 state machine.
22	R/W	0	register bit from chan0 rx_lp_en.
21	R/W	0	chan0 contention detection enable control selection. 1 = from register. 0 from chan0 state machine.
20	R/W	0	register bit from chan0 contention detection enable.
19	R/W	0	chan1 tx_hs_en control selection. 1 = from register. 0 from chan0 state machine.
18	R/W	0	register bit for chan1 tx_hs_en.
17	R/W	0	chan1 tx_lp_en control selection. 1 = from register. 0 from chan0 state machine.
16	R/W	0	register bit from chan1 tx_lp_en.
15	R/W	0	chan2 tx_hs_en control selection. 1 = from register. 0 from chan0 state machine.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
14	R/W	0	register bit for chan2 tx_hs_en.
13	R/W	0	chan2 tx_lp_en control selection. 1 = from register. 0 from chan0 state machine.
12	R/W	0	register bit from chan2 tx_lp_en.
11	R/W	0	chan3 tx_hs_en control selection. 1 = from register. 0 from chan0 state machine.
10	R/W	0	register bit for chan3 tx_hs_en.
9	R/W	0	chan3 tx_lp_en control selection. 1 = from register. 0 from chan0 state machine.
8	R/W	0	register bit from chan3 tx_lp_en.
4	R/W	0	clk chan power down. this bit is also used as the power down of the whole MIPI_DSI_PHY.
3	R/W	0	chan3 power down.
2	R/W	0	chan2 power down.
1	R/W	0	chan1 power down.
0	R/W	0	chan0 power down.

**MIPI\_DSI\_CHAN\_STS [31:0] 0x02**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24	R/W	0	chan0 TX->RX turn can't accept the ACK command from slave watch dog triggered. write 1 to clear the status bit.
23	R/W	0	chan0 RX ESC command watch dog triggered. write 1 to clean this bit.

# 11. Audio Path

A311D integrates 3 TDM input/output interface, 1 SPDIF input, 2 SPDIF output interface, 1 PDM interface upto 8 channels, 3 TODDR (FIFO) for transfer input data to DDR, 1 TOSRAM for transfer input data to M4 MEM, 3 FRDDR (FIFO) for transfer data from DDR to output, 1 TDM LB & Loopback for AEC, 1 HW resample for clock synchronization, 1 power detect for voice wake up, and 1 clock locker detect difference of two clock. Below is the diagram for A311D audio path.

Figure 11-1 Diagram of Audio Path

## 11.1 Audio\_Input

### 11.1.1 Overview

This section describes TDM input interface, SPDIF input interface and PDM input interface..

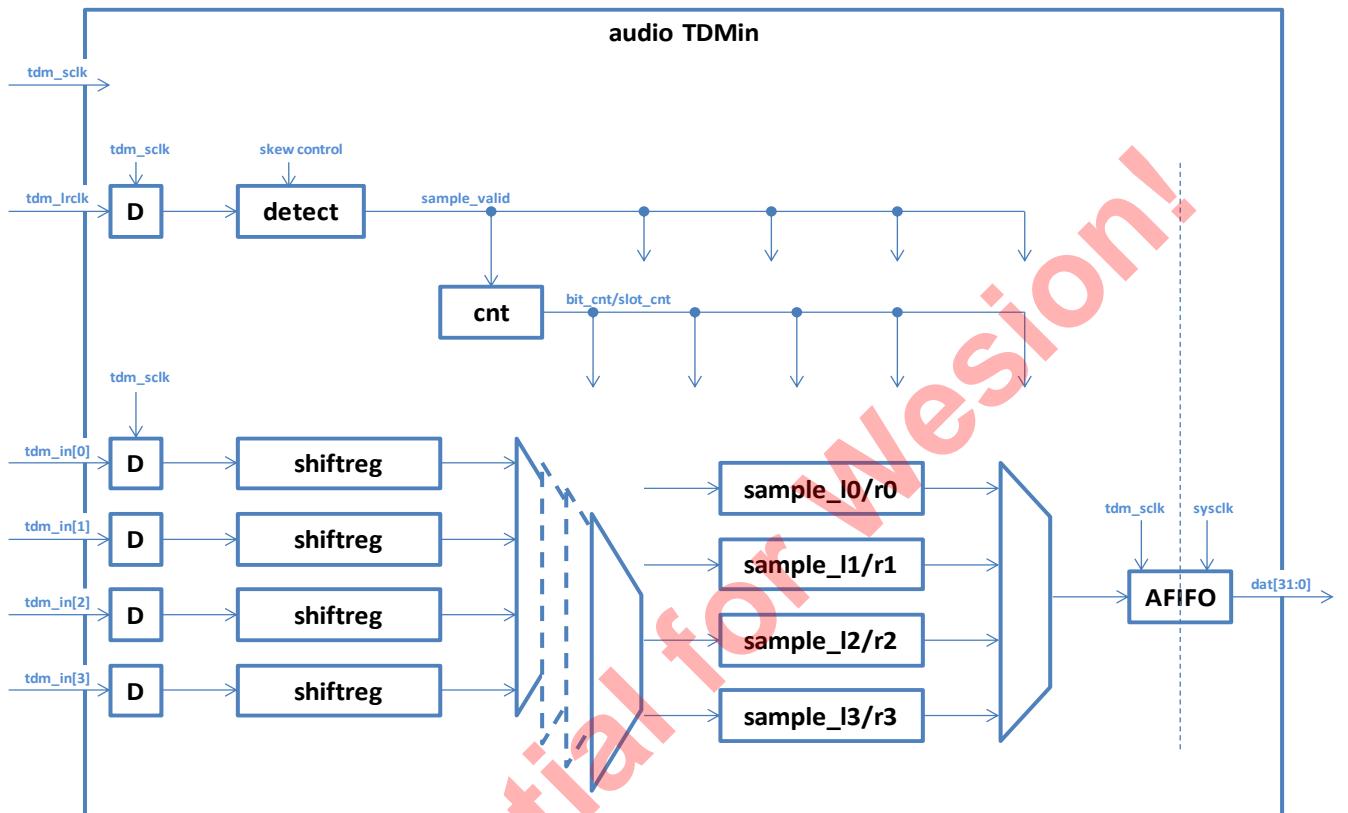

### 11.1.2 TDM Input Interface

TDM input interface works in the following way:

1. All worked at tdm\_sclk before AFIFO,
2. Output is worked at sysclk;
3. Add skew control between Irclk and data;
4. Detect rise or fall edge of Irclk and clear bit\_cnt/slot\_cnt;

5. Store 4 data in to 4 shift register (max 32bits) ;
6. Swap 4 shift register to 8 sample data;
7. Send 8 sample data out in serials by mask/mute configure;
8. Below is the diagram of TDM input interface.

**Figure 11-2 Diagram of SPIDF**

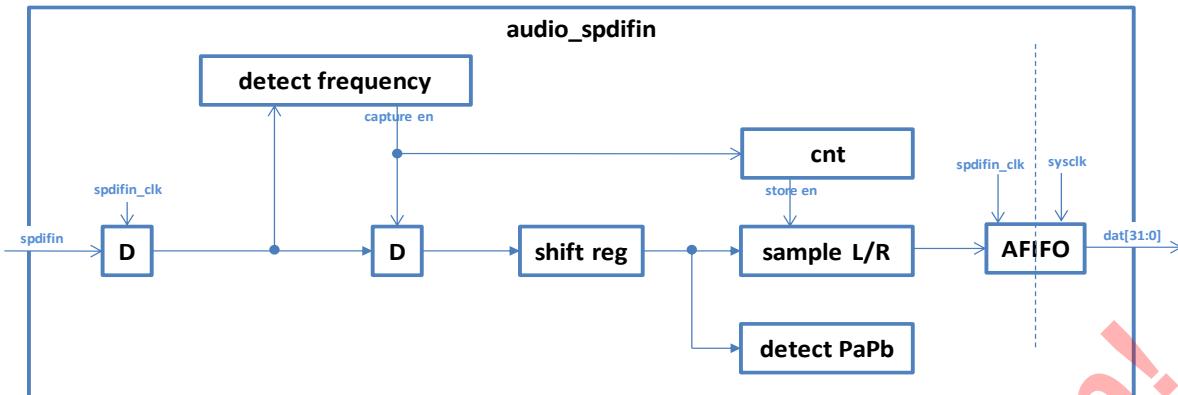

### 11.1.3 SPIDF Interface

SPIDF input interface works in the following way:

1. All worked at spdifin\_clk before AFIFO;
2. After AFIFO worked at sysclk;
3. Detect frequency by rise or fall edge;
4. Capture data to shift reg;
5. Store data to sample L channel or R channel;
6. Detect PaPb if it's IEC60937;

Below is the diagram of SPIDF input interface.

Figure 11-3 SPDIF Input Interface

### 11.1.4 PDM

PDM input Decimation Filter is a highly programmable multistage decimation filter. It supports 4 inputs or 8 channel PDM digital microphone interface. Each channel contains one 9 stage CIC filter, 3 low power filters and a high pass filter. The PDM input bit rate is calculate with  $fs * OSR$ . OSR can be 64, 128, 192 or 256.

CIC filter may have 3 to 9 CIC stages and the downsample rate also can be programmable. There is a multiplier and shifter to adjust the result to match the accuracy and CIC bit width.

There are 3 low pass filters which shared a 336x24 Coefficient memory and a 336x28 data memory. That means these 3 filters can be configed upto 336 taps together. The coefficient memory need to be programmed through APB bus. For example, if the filter 1 contains 140 taps, filter2 contains 32 taps, filter 3 contain 146 steps, the filter 1 coefficient will use 0~139 of the coefficient memory address; the filter 2 coefficient will use 140~171 of coefficient memory address and the filter 3 coefficient will use 172~317 of the coefficient memory address. The fillter stage controller will based on the downsample rate, filter taps and the rounding mode of each filter to arrange the filter.

The final high pass filter is used to filter the DC current.

Figure 11-4 PDM Decimation Filter

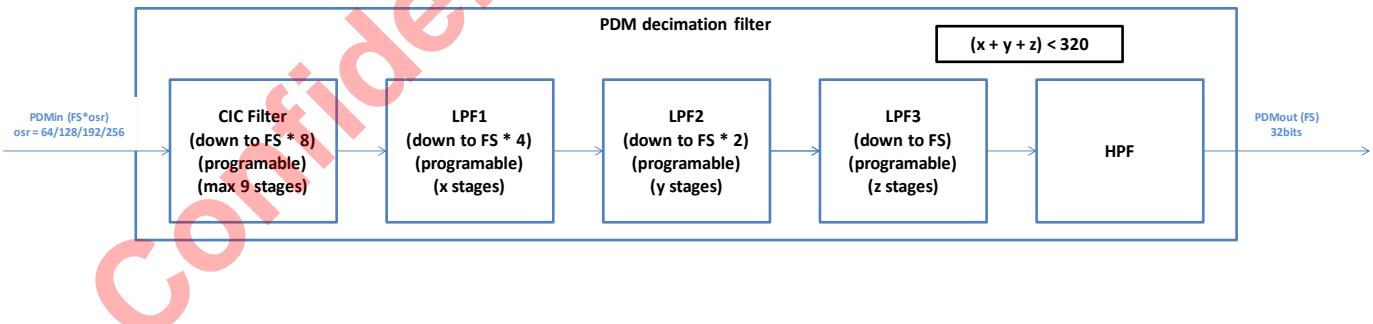

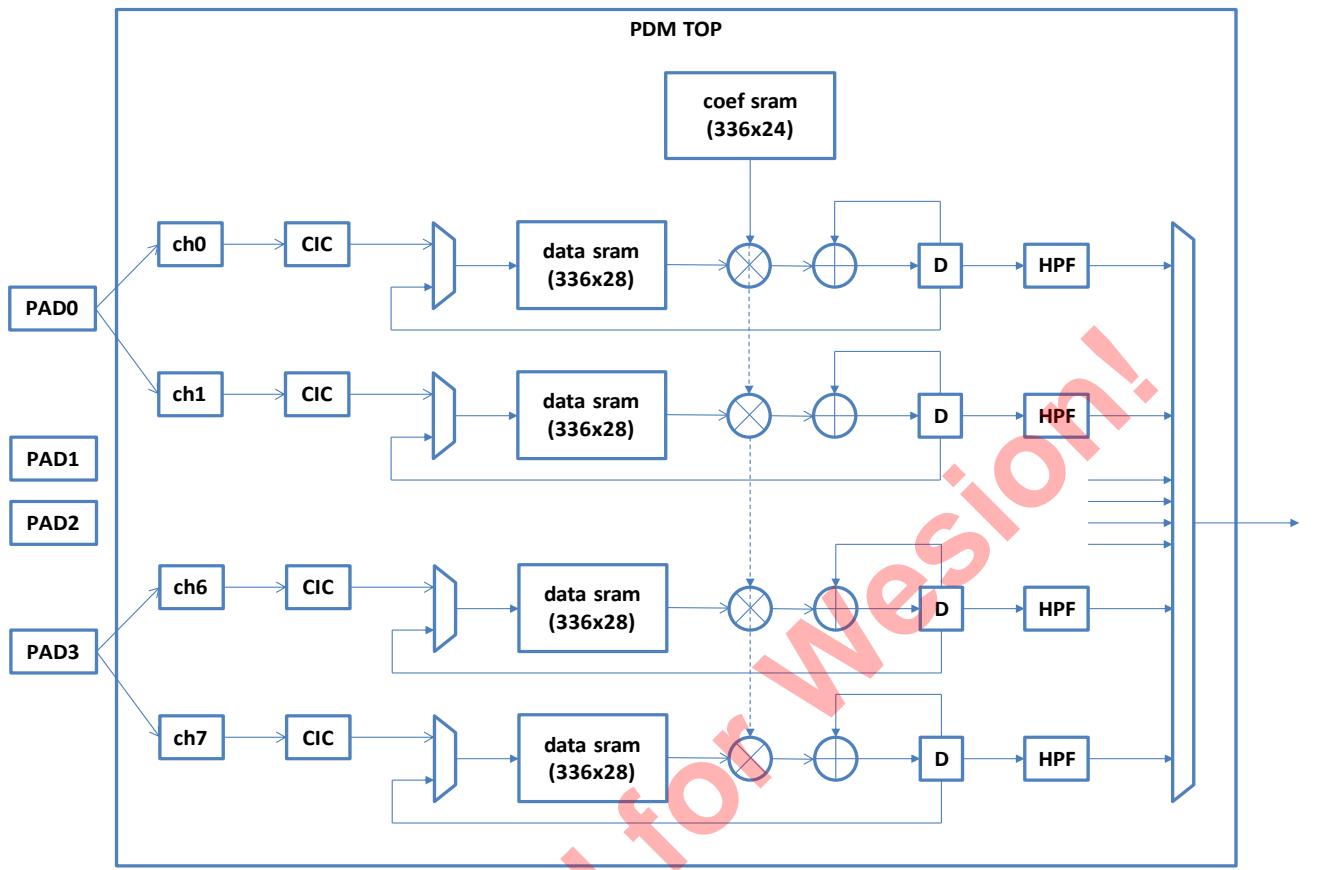

Figure 11-5 PDM Structure

## 11.2 Audio Output

### 11.2.1 Overview

This part describes TDM output interface, SPDIF output interface and audioreq\_frddr submodule.

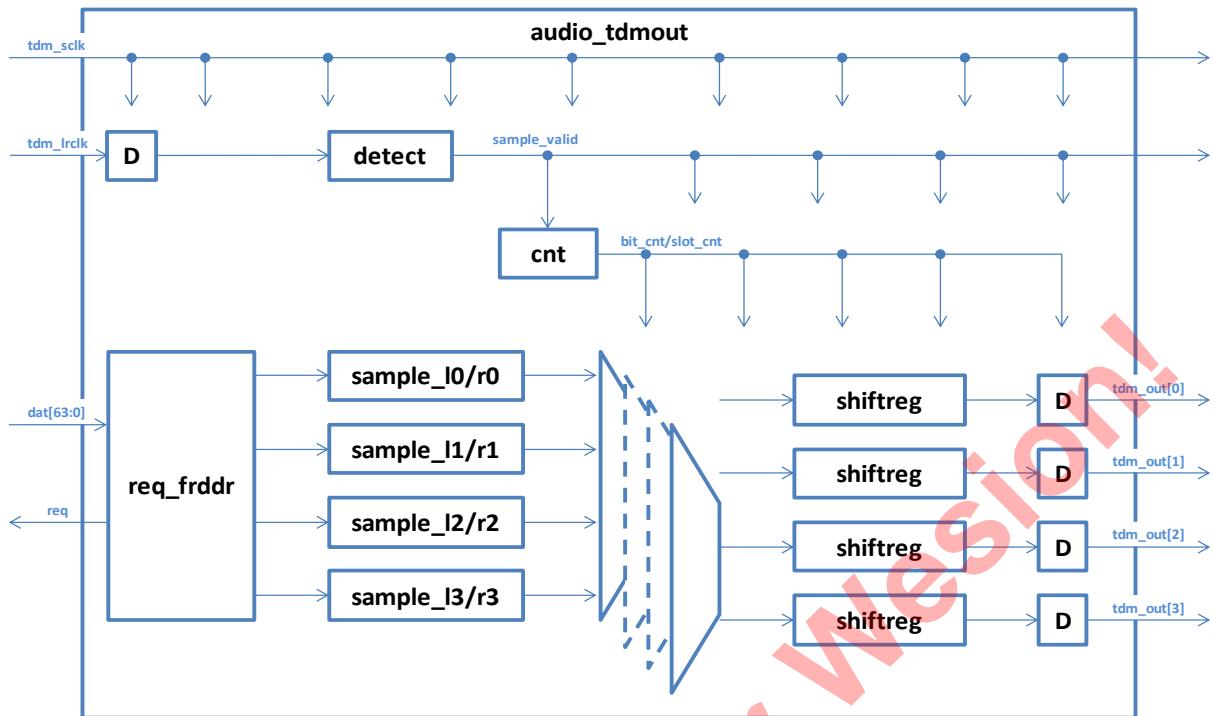

### 11.2.2 TDM Output Interface

TDM output interface works in the following way:

1. All worked at tdm\_sclk;
2. Detect sample valid by tdm\_lrclk rise edge and clear bit\_cnt/slot\_cnt;
3. Request data from FRDDR and store to 8 sample register;
4. Swap 8 sample register;
5. Shift send out data;

Below is the diagram of TDM output interface.

Figure 11-6 TDM Output Interface

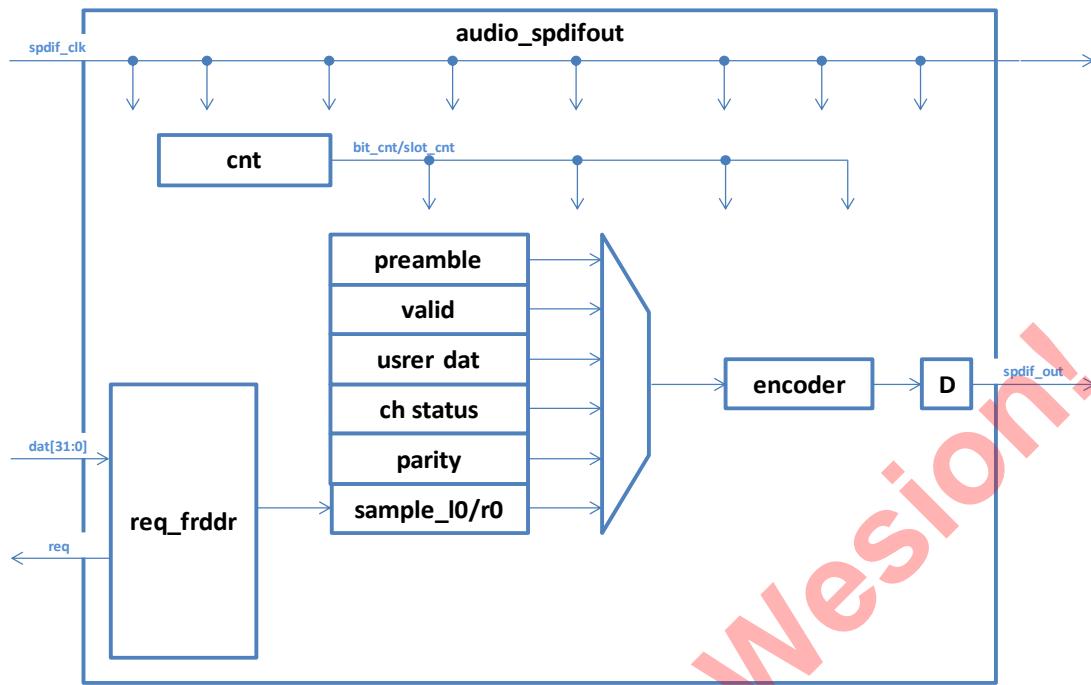

### 11.2.3 SPDIF Output Interface

The SPDIF output interface works in the following way:

1. All worked at **spdifout clk**;
2. Request data from FRDDR and store to sample L0/R0;
3. Select data by **bit\_cnt/slot\_cnt** and send out;

Below is the diagram of SPDIF output interface.

**Figure 11-7 SPDIF Output Interface**

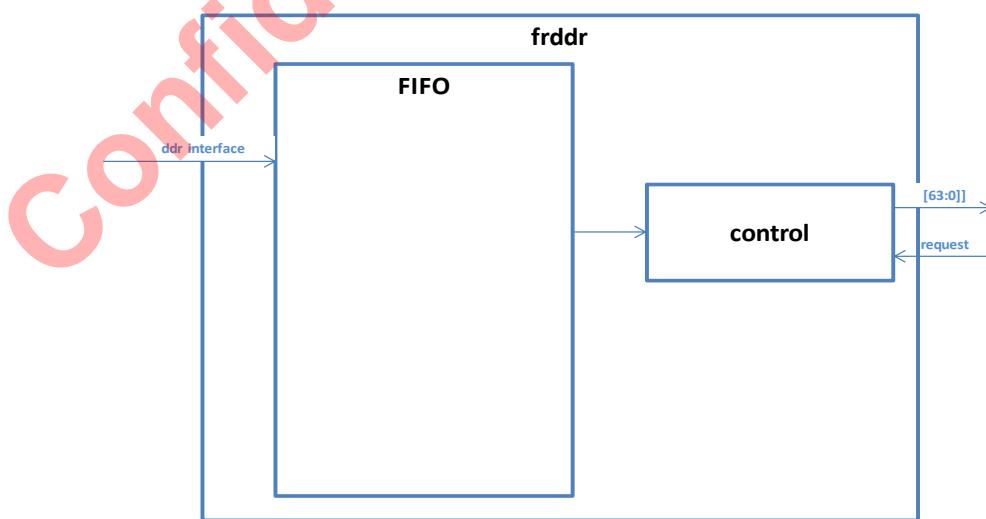

The SPDIF(encode) add same source select. The SPDIF out can be the same with i2s0/1/2/3, and can select before or after eq/drc.

#### 11.2.4 Audioreq\_FRDDR

Audioreq\_Frddr transfers data from sys clock to out clock and change format in the following way;

1. Wait for OUT enable and FRDDR initial done;
2. Request first time and fill 8 sample;
3. When received update data , it will send request to FRDDR and update 8 sample;

Below is a diagram of Audioreq\_Frddr

**Figure 11-8 Audioreq\_Frddr**

## 11.3 DDR Datapath

### 11.3.1 Overview

This part describes the datapath between audio module and DDR.

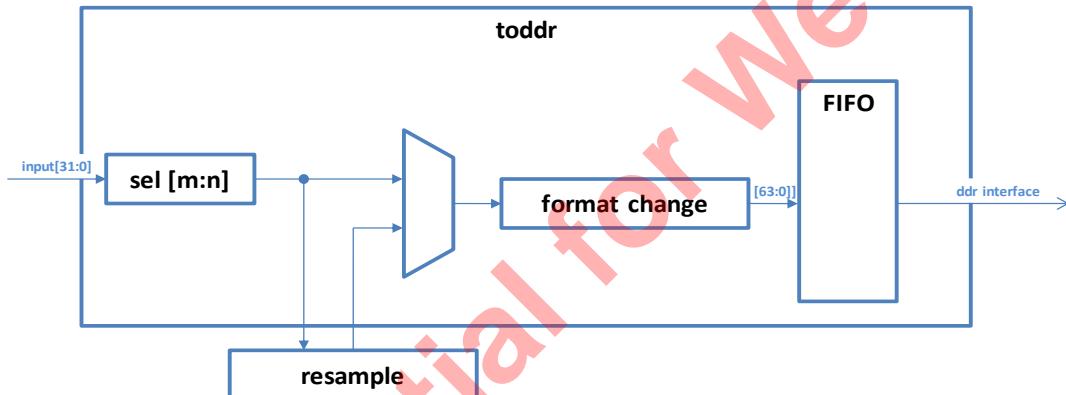

### 11.3.2 Audio TODDR

A311D has 3 TODDR(FIFO), TODDR\_A's FIFO depth is 256x64; B/C are 128x64. TODDR module works in the following way:

1. All worked at sysclk;
2. Resample if need;
3. Change format and package to 64 bits data by configure;
4. Write to fifo;
5. Read data from fifo and send to DDR automatically by configure;

Below is the Diagram of Audio TODDR.

Figure 11-9 Audio TODDR

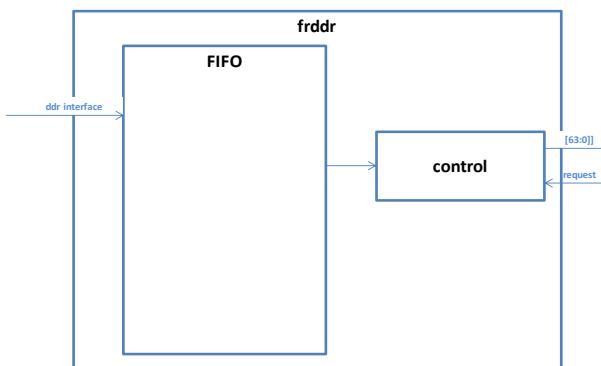

### 11.3.3 Audio FRDDR

A311D has 3 FRDDR(FIFO), FRDDR\_A's FIFO depth is 256x64, B/C are 128x64;

1. All worked at sysclk;
2. When enable FRDDR, it will fill FIFO from DDR first;
3. When FRDDR receive request, it will read data from fifo and send out;
4. FRDDR will fill FIFO automatically by configure;

Below is the Diagram of Audio FRDDR.

Figure 11-10 Audio FRDDR

## 11.4 Audio TORAM

TORAM is similar as TODDR, just use RAM interface.

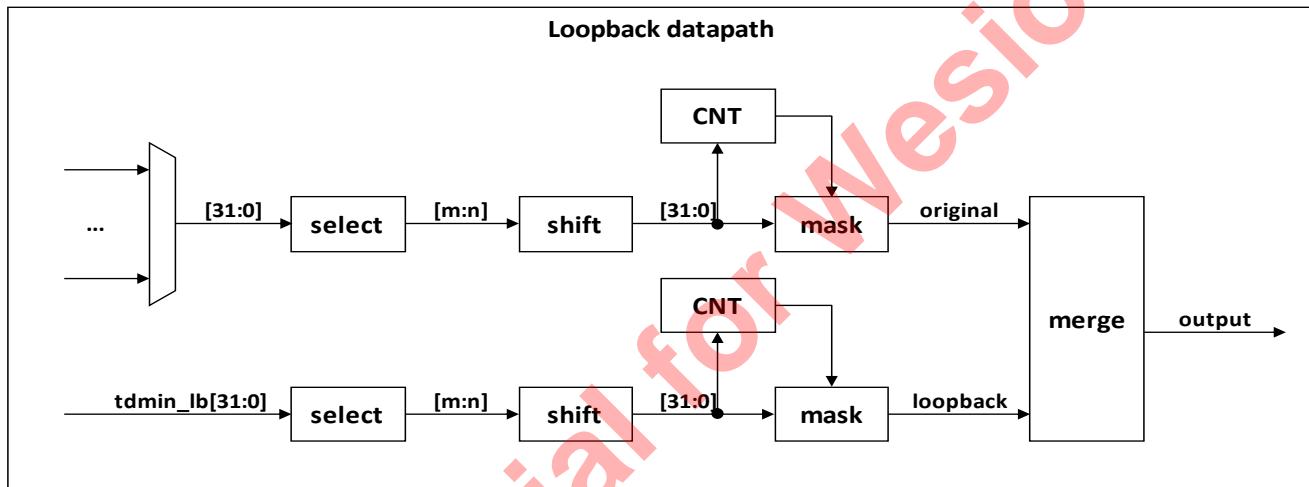

## 11.5 Audio Loopback

TDMIN\_LB can receive one TDMOUT or TDMIN, it can merger with one TDMIN/SPDIFIN/PDMIN in the following way:

1. Store one source to temp register;
2. When another source arrived, send out direct;
3. When finished, send out temp register;

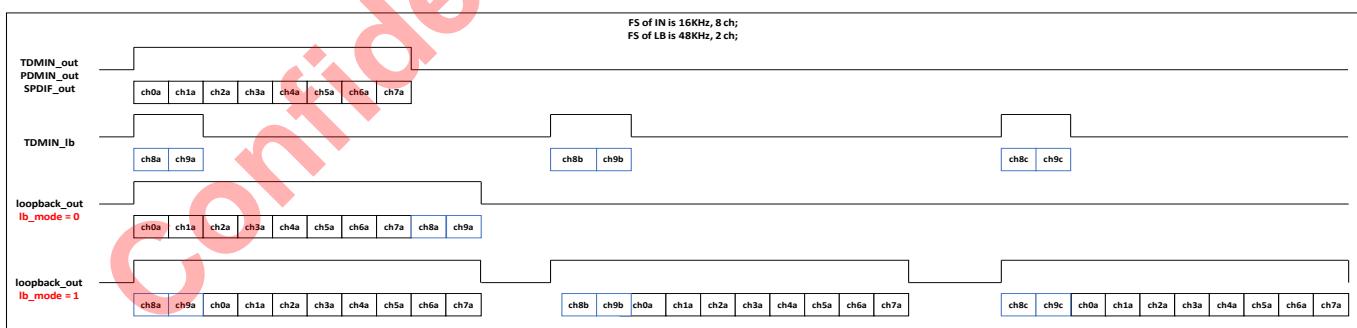

Below is the diagram of audio loopback datapath.

Figure 11-11 Audio Loopback Data Path

Audio loopback wave form are shown below.

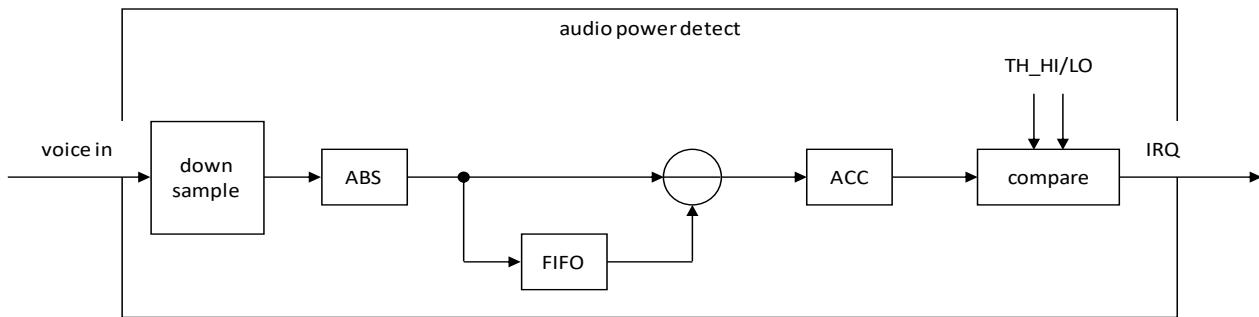

Figure 11-12 Audio Loopback Wave Form

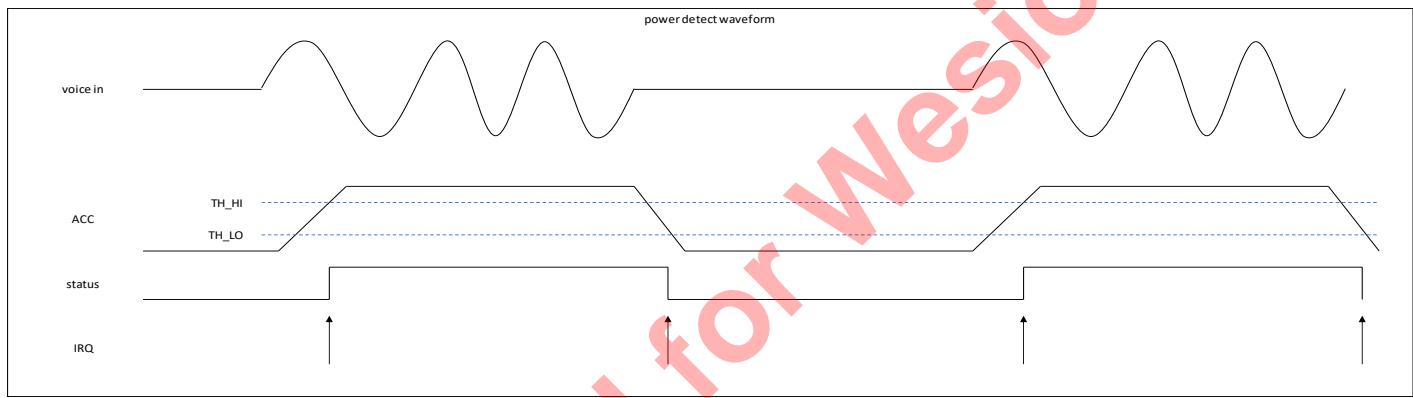

## 11.6 Audio Power Detect

Audio Power Detect submodule calculate a window of voice and compares it to TH\_HI/LO. It generates IRQ when status changes.

Below is the diagram of audio power detect data path.

**Figure 11-13 Audio Power Detect Data Path**

Audio power detect wave form is shown below:

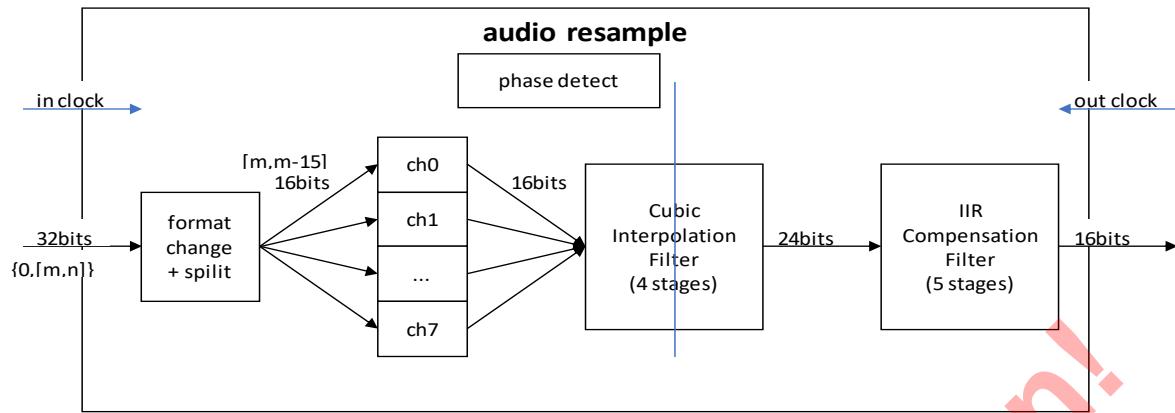

**Figure 11-14 Audio Power Detect Wave Form**

## 11.7 Audio Resample

Audio resample changes data from one symbol rate to another symbol rate in the following step:

1. Input is from Toddr and selected by toddr's m/n register;
2. ExampleA: `toddr_m = 27, toddr_n=4, resample_in[31:0] = {8'd0, toddr_in[27:4]}`;
3. Cut or extend input from 32bits to 16bits;
4. By exampleA, set `resample_M = 23`, then `filter_in = toddr_in[27:12]`;
5. Split to each channel (max is 8ch);
6. Interpolation by a cubic filter;
7. Use an IIR filter compensate;

Figure 11-15 Audio Resample

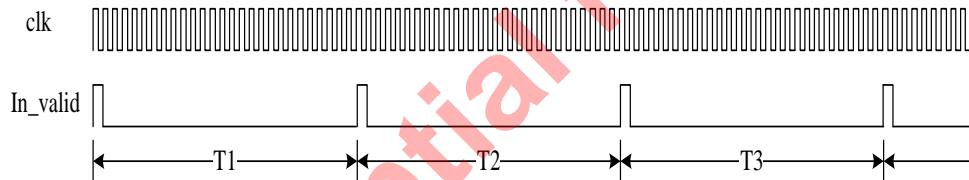

In the diagram, the module phase\_det is used to calculate the interpolation phase, the module interp is used to implement the interpolation processing. There are two method which be implemented to calculate the interpolation phase. One is front feedback method, the other is accumulation method. They can be switched by register.

#### method 0

The method 0 is the direct feedback method. According the out\_valid, it interpolates the mapping sample. The operation flow is given below:

Step 1: calculate the input data rate(average the count every input valid signal). For hdmi\_rx audio data, the input rate is basically even.

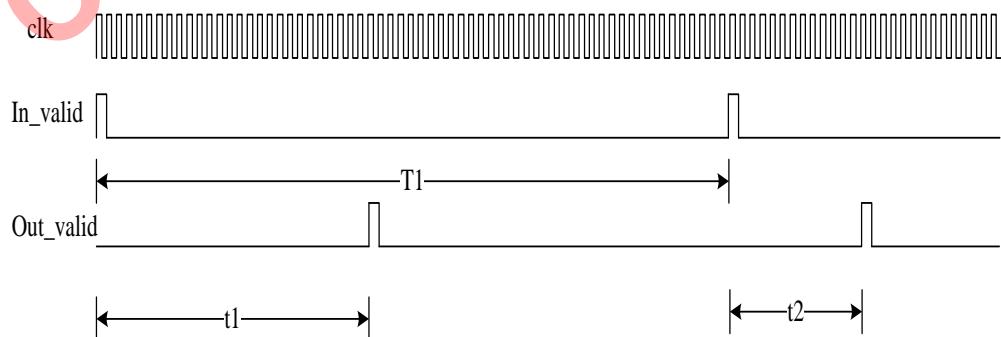

Count the clock number in T1, T2, and so on. get CNT then do average:

$$T = 0.999*T + 0.001*CNT$$

For 8 channels signal, the CNT should be count between 8 in\_valid signal.

Step 2: in the output clock domain, generate the output valid signal. Because the output clock should be integral times of output frequency, the valid signal can easily generated by counting the output clock. Then change the valid signal to main clock domain.

Step 3: calculate the interpolation phase mu.

Count the clock number in t1 get cnt, then mu can be calculated:

$\text{Mu} = \text{cnt}/T$

The bit width of mu is 9 bits.

Step 4: do the interpolation(4 points cubic interpolation)

Basic function is:

$Y = ((a*\text{mu} + b)*\text{mu} + c)*\text{mu} + d$ , which mu is interpolation phase.

and

$a = 16*x_0 - 48*x_1 + 48*x_2 - 16*x_3$

$b = 31*x_0 - 31*x_1 - 31*x_2 + 31*x_3$

$c = 23*x_0 + 59*x_1 - 59*x_2 - 23*x_3$

$d = 6*x_0 + 58*x_1 + 58*x_2 + 6*x_3$

Which  $x_0, x_1, x_2, x_3$  is the delay line of input data.

#### Performance analysis:

The advantage of this method is that the output data rate is generated by output clock and match the acquirement of software absolutely.

The disadvantage is that the interpolation phase has bias. The bias relies on the main clock. More higher the main clock frequency is, more precise the interpolation result is.

Actually the precision of interpolation phase is 9 bits, so the frequency of main clock should be more than 512 times of input data rate.

#### method 1

The method 1 is accumulation method. It assume the output frequency is accurate and stable. It sets a fixed phase step. The phase step is the ratio of the input frequency to output frequency. Every step, it outputs a sample. About the bias of input frequency, there is a register to report the statistics value. It can be used to adjust the initial phase step by firmware.

#### Performance analysis:

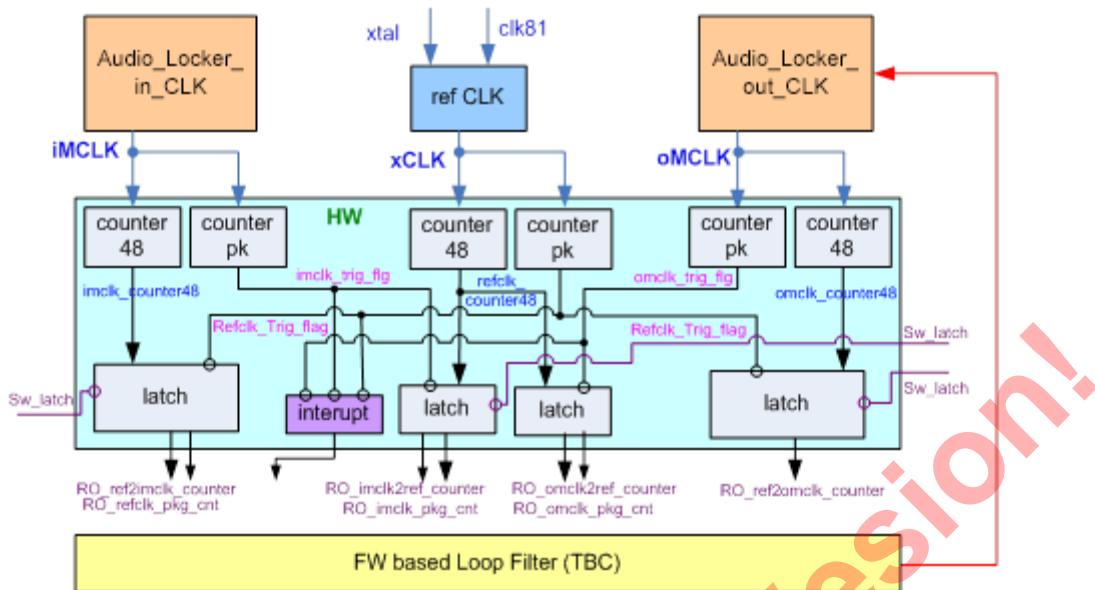

This method requires the audio output frequency precision, because there is no information statistics of output frequency. When the audio output frequency is not stable, it is recommended it not be used.

## 11.8 Audio Locker

The audio input clock and output clock are in different power domain and may have little difference, the difference leads to FIFO problem, A311D use Audio Locker module to fix this problem, the basic method is to measure the difference between different clock and adjust(software dynamically) the clock frequency to make them match.

Below show the diagram of Audio Locker module.

Figure 11-16 Audio Locker Diagram

## 11.9 Register Description

### 11.9.1 PDM Registers

Base Address: 0xFF640000

Each register final address = module base address + address \* 4

#### PDM\_CTRL 0x00

Bits	R/W	Default	Description
31	R/W	0x00000000	PDM enable
30	R/W		invert the PDM_DCLK
29	R/W		output mode: 1: 24bits. 0: 32 bits
28	R/W		bypass mode. 1: bypass all filter. directly output the PDM input to DDR. 0: normal mode.
27:20	R/W		pdm_mute_mask[7:0]; [7] mute pdm ch7; ... [0] mute pdm ch0;
17	R/W		chnum_en. 1: start send ch_cnt out.
16	R/W		PDM Asynchronous FIFO soft reset. write 1 to soft reset AFIFO
15:8	R/W		PDM channel reset. 0: to reset each PDM channel. 1: normal mode
7:0	R/W		PDM channel enable. each bit for one channel

#### PDM\_HCIC\_CTRL1 0x01

Bits	R/W	Default	Description

31	R/W	0x00000000	hcic filter enable. 1 use sinc filter. 0 bypass input to output
29:24	R/W		hcic final gain shift parameter
23:16	R/W		hcic final gain multiplier
8:4	R/W		hcic down sample rate
3:0	R/W		hcic stage number. must be between 3 to 9

**PDM\_HCIC\_CTRL2 0x02****PDM\_F1\_CTRL 0x03**

Bits	R/W	Default	Description
31	R/W	0x00000000	filter 1 enable
16:15	R/W		f1 round mode. 2'b00 : sign bit at bit 49. 28bits output [49:22] round at bit 21. 32bits output [49:18]. 24bits output [49:26] 2'b01 : sign bit at bit 50. 28bits output [50:23] round at bit 22. 32bits output [49:18]. 24bits output [49:26] 2'b10 : sign bit at bit 51. 28bits output [51:24] round at bit 23 32bits output [49:18]. 24bits output [49:26].
15:12	R/W		filter 1 down sample rate
8:0	R/W		filter 1 stage number

**PDM\_F2\_CTRL 0x04**

Bits	R/W	Default	Description
31	R/W	0x00000000	filter 2 enable
16:15	R/W		F2 round mode. 2'b00 : round at bit 21. 2'b01 : round at bit 22. 2'b10 : round at bit 23
15:12	R/W		filter 2 down sample rate
8:0	R/W		filter 2 stage number

**PDM\_F3\_CTRL 0x05**

Bits	R/W	Default	Description
31	R/W	0x00000000	filter 3 enable
16:15	R/W		F3 round mode. 2'b00 : round at bit 21. 2'b01 : round at bit 22. 2'b10 : round at bit 23
15:12	R/W		filter 3 down sample rate
8:0	R/W		filter 3 stage number

**PDM\_HPF\_CTRL 0x06**

Bits	R/W	Default	Description
31	R/W	0x00000000	High pass filter enable
20:16	R/W		high pass filter shift steps. 6~19 steps

15:0	R/W		high pass filter output factor
------	-----	--	--------------------------------

**PDM\_CHAN\_CTRL 0x07**

Bits	R/W	Default	Description
31:24	R/W	0x00000000	Chan3 data sample pointer vs edge of the PDM_DCLK
23:16	R/W		Chan2 data sample pointer vs edge of the PDM_DCLK
15:8	R/W		Chan1 data sample pointer vs edge of the PDM_DCLK
7:0	R/W		Chan0 data sample pointer vs edge of the PDM_DCLK

**PDM\_CHAN\_CTRL1 0x08**

Bits	R/W	Default	Description
31:24	R/W	0x00000000	Chan7 data sample pointer vs edge of the PDM_DCLK
23:16	R/W		Chan6 data sample pointer vs edge of the PDM_DCLK
15:8	R/W		Chan5 data sample pointer vs edge of the PDM_DCLK
7:0	R/W		Chan4 data sample pointer vs edge of the PDM_DCLK

**PDM\_COEFF\_ADDR 0x09**

Bits	R/W	Default	Description
8:0	R/W	0x00000000	address of the write/read of coeff data

**PDM\_COEFF\_DATA 0x0A**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	write/read data to coeff memory

**PDM\_CLKG\_CTRL 0x0B**

Bits	R/W	Default	Description
6	R/W	0x00000000	filt_ctrl module auto clock gating control
5	R/W		sinc fifo module auto clock gating control
4	R/W		filter module auto clock gating control
3	R/W		apb module auto clock gating control
2	R/W		coeff memory module auto clock gating control
1	R/W		each channel module auto clock gating control
0	R/W		cts_pdm_clk auto clock gating control

**PDM\_STS 0x0C**

Bits	R/W	Default	Description
1	R/W	0x00000000	HPF filter output overflow. means the PCLK is too slow
0	R/W		HCIC filter output overflow. means the CTS_PDM_CLK is too slow. can't finished the filter function.

**PDM\_MUTE\_VALUE 0x0D**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	mute value if mute_mask = 1;

**11.9.2 CLK Registers**

The register signal are connected in the following way, the \*\_slv\_sclk\_\* signal are connected to only a,b,c from core pinmux, \*\_slv\_sclk\_d is connected to wifi\_beeacon signal; only slv\_lrclk\_a, b, c are connected, slv\_lrclk\_d is not connected, as shown in the following table:

Table 11-1 Audio Clock Signal Connection

Register Signal	Connected Signal
i_slv_sclk_a	TDMA_SLV_SCLK
i_slv_sclk_b	TDMB_SLV_SCLK
i_slv_sclk_c	TDMC_SLV_SCLK
i_slv_sclk_d	wifi_beeacon
i_slv_lrclk_a	TDMA_SLV_FS
i_slv_lrclk_b	TDMB_SLV_FS
i_slv_lrclk_c	TDMC_SLV_FS
i_slv_lrclk_d	-

For Below registers:

Base Address: 0xFF642000

Each register final address = module base address+ address \* 4

**EE\_AUDIO\_CLK\_GATE\_EN 0x00**

Bits	R/W	Default	Description
22	R/W	0x00000000	eqdrc, 0:disable; 1:enable;
21	R/W	0x00000000	spdifoutB, 0:disable; 1:enable;
20	R/W	0x00000000	toram, 0:disable; 1:enable;
19	R/W	0x00000000	power detect, 0:disable; 1:enable;
18	R/W		resample, 0:disable; 1:enable;

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
17	R/W		spdifout, 0:disable; 1: enable;
16	R/W		spdifin, 0:disable; 1: enable;
15	R/W		loopback, 0:disable; 1: enable;
14	R/W		toddrc, 0:disable; 1: enable;
13	R/W		toddrb, 0:disable; 1: enable;
12	R/W		toddra, 0:disable; 1: enable;
11	R/W		frddrc, 0:disable; 1: enable;
10	R/W		frddrb, 0:disable; 1: enable;
9	R/W		frddra, 0:disable; 1: enable;
8	R/W		tdmoutc, 0:disable; 1: enable;
7	R/W		tdmoutb, 0:disable; 1: enable;
6	R/W		tdmdouta, 0:disable; 1: enable;
5	R/W		tdminlb, 0:disable; 1: enable;
4	R/W		tdminc, 0:disable; 1: enable;
3	R/W		tdminb, 0:disable; 1: enable;
2	R/W		tdmina, 0:disable; 1: enable;
1	R/W		pdm, 0:disable; 1: enable;
0	R/W		ddr_arb, 0:disable; 1: enable;

**EE\_AUDIO\_MCLK\_A\_CTRL 0x01**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0x00000000	clk_en, 0:disable; 1: enable;
30	R/W		Force_oscin, 0:disable; 1: force clock source as oscin(24M);
26:24	R/W		clk_sel, 0:mp0_pll; 1:mp1_pll; 2:mp2_pll; 3:mp3_pll; 4:hifi_pll; 5:fclk_div3(666M); 6:fclk_div4(500M); 7:gp0_pll;
15:0	R/W		clk_div, the frequency of mclk = pll/clk_div;

**EE\_AUDIO\_MCLK\_B\_CTRL 0x02**

Same as EE\_AUDIO\_MCLK\_A\_CTRL.

**EE\_AUDIO\_MCLK\_C\_CTRL 0x03**

Same as EE\_AUDIO\_MCLK\_A\_CTRL.

15:0	R/W		the frequency of pdm_dclk = pll/clk_div;

**EE\_AUDIO\_CLK\_PDMIN\_CTRL1 0x2c**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31	R/W	0x00000000	clk_en, 0:disable; 1: enable;
30	R/W		Force_oscin, 0:disable; 1: force clock source as oscin(24M);
26:24	R/W		clk_sel, 0:mp0_pll; 1:mp1_pll; 2:mp2_pll; 3:mp3_pll; 4:hifi_pll; 5:fclk_div3(666M); 6:fclk_div4(500M); 7:gp0_pll;
15:0	R/W		the frequency of pdm_sysclk = pll/clk_div;

**EE\_AUDIO\_CLK\_SPDIFOUT\_B\_CTRL 0x2d**

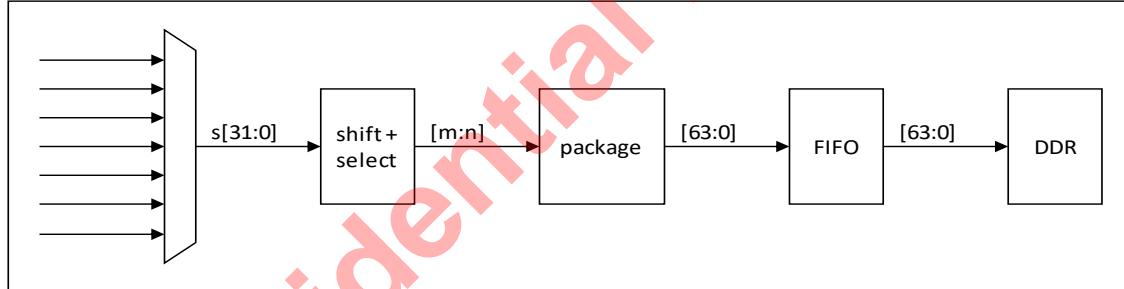

Bits	R/W	Default	Description
31	R/W	0x00000000	clk_en, 0:disable; 1: enable;
30	R/W		Force_oscin, 0:disable; 1: force clock source as oscin(24M);
26:24	R/W		clk_sel, 0:mp0_pll; 1:mp1_pll; 2:mp2_pll; 3:mp3_pll; 4:hifi_pll; 5:fclk_div3(666M); 6:fclk_div4(500M); 7:gp0_pll;
9:0	R/W		clk_div, the frequency of mclk = pll/clk_div;

**11.9.3 TODDR Registers****EE\_AUDIO\_TODDR\_A\_CTRL0 0x40**

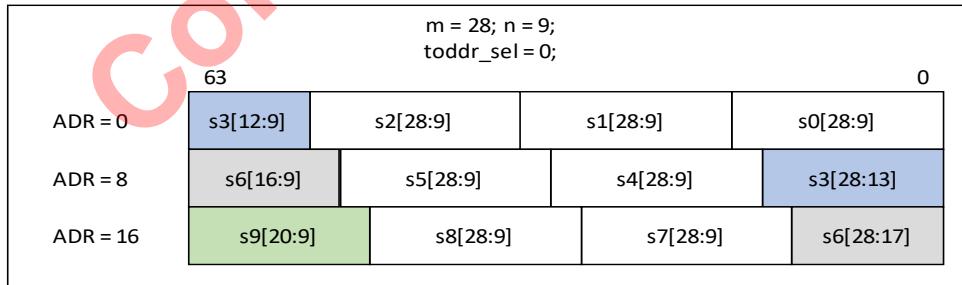

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_toddr_en, 0: disable; 1: enable;
30	R/W		reg_sel_resample, 0: select original data; 1: select reample data;
29	R/W		reg_ext_signed, 0: extend bits as "0"; 1: extend bits as "msb";
28	R/W		reg_toddr_pp_mode, 0: select write to only one buff (start_addr,finish_addr); 1: select write to two buff (start_addr,finish_addr) (start_addrb, finish_addrb);
27	R/W		Enable_sync_chnum; 1: start store data when first ch ;
26:24	R/W		reg_toddr_endian
23:16	R/W		reg_toddr_int_en [23] : reserved; [22] : reserved;

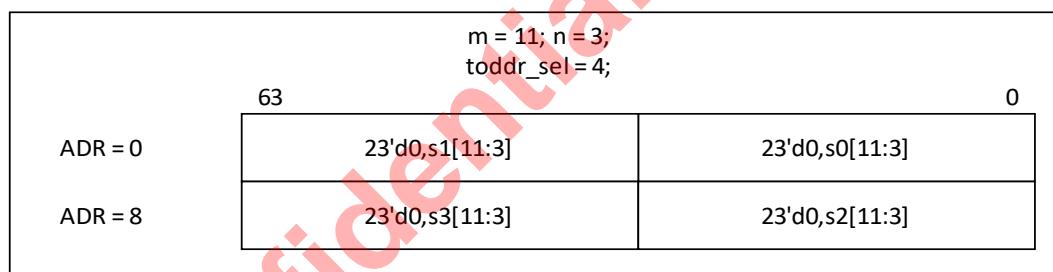

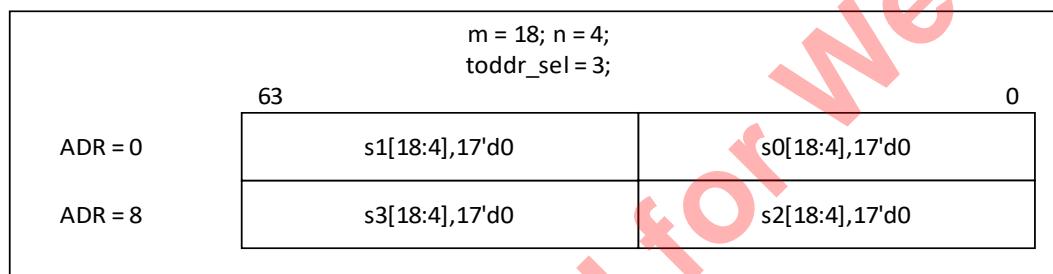

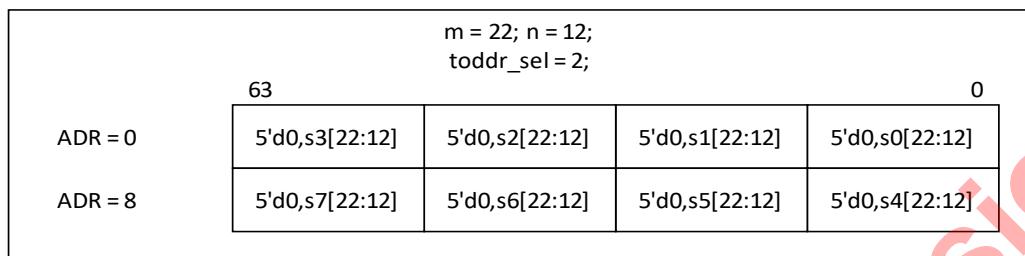

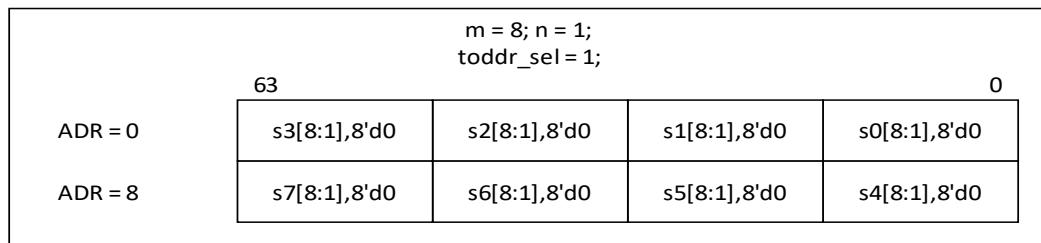

Bits	R/W	Default	Description
			[21] : fifo overflow, write when fifocnt = depth; [20] : fifo overflow, read when fifocnt = 0; [19] : when write to ddr "int_addr" data (only once); [18] : when write to ddr "int_addr" data (repeat); [17] : when write to ddr address match "int_addr"; [16]: when write to ddr address match "finish_addr";
15:13	R/W		reg_toddr_sel, 0: combined data[m:n] without gap; like S0[m:n],S1[m:n],S2[m:n],... 1: combined data[m:n] as 16bits; like {S0[11:0],4'd0},{S1[11:0],4'd0}... 2: combined data[m:n] as 16bits; like {4'd0,S0[11:0]},{4'd0,{S1[11:0]}... 3: combined data[m:n] as 32bits; like {S0[27:4],8'd0},{S1[27:4],8'd0}... 4: combined data[m:n] as 32bits; like {8'd0,S0[27:4]},{8'd0,{S1[27:4]}...
12:8	R/W		reg_toddr_m_sel, the msb positioin in data
7:3	R/W		reg_toddr_n_sel, the lsb position in data
2:0	R/W		reg_toddr_src_sel, [7]: loopback; [6]: tDMIN_lb; [5]: reserved; [4]: pDMIN; [3]: SPDIFIN; [2]: tDMIN_c; [1]: tDMIN_b; [0]: tDMIN_a;

We can change format before write to DDR:

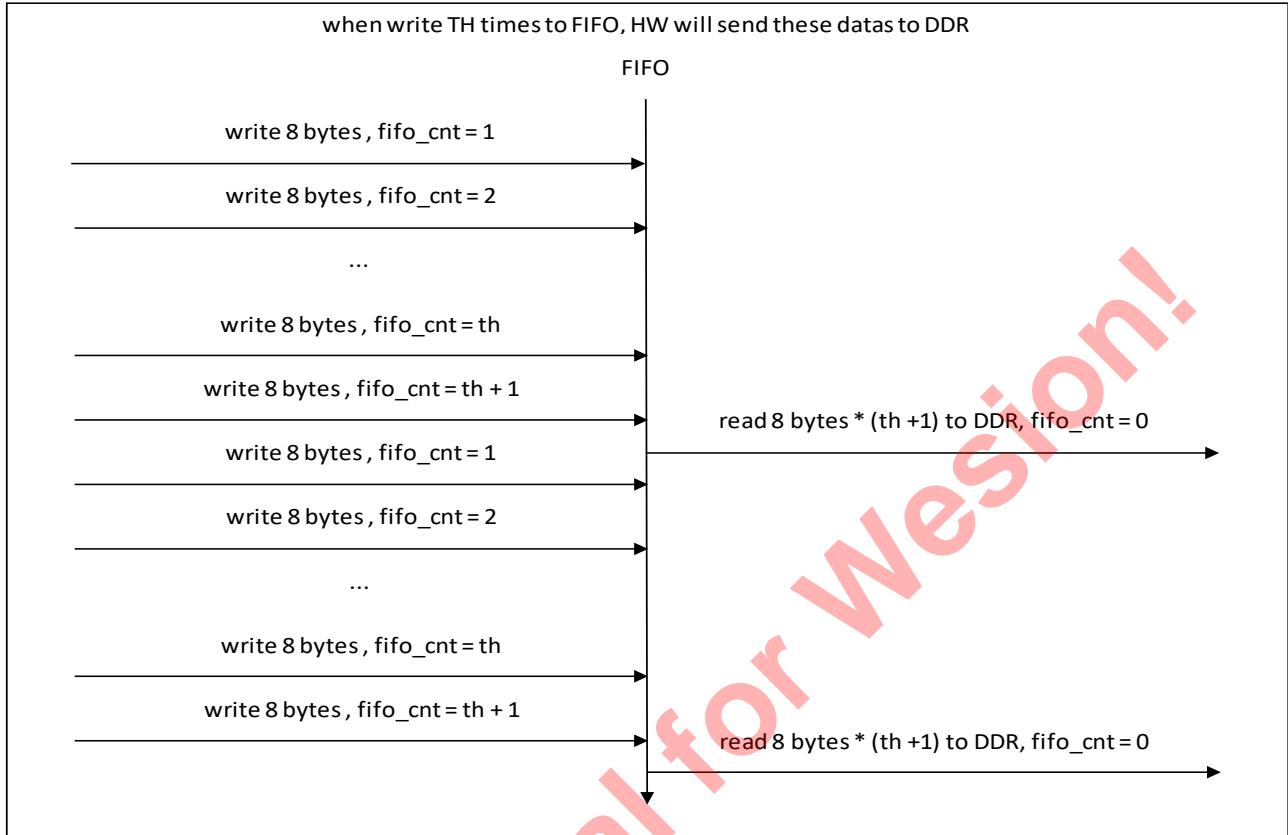

For example:

**EE\_AUDIO\_TODDR\_A\_CTRL1 0x41**

Bits	R/W	Default	Description
25	R/W	0x00000000	force_finish; the value from 0-> 1: force finish by current address and jump to start_address;
24	R/W		Insert_chnum; 0: disable; 1: insert chnum[9:0] to data[9:0]
23:16	R/W		reg_fifo_start_rd_th, each time, when fifo_cnt greater than this register, control will start read data from fifo and write to DDR; write length is "reg_fifo_start_rd_th + 1" * 8bytes;
11:8	R/W		reg_status_sel, control status2 source;

7:0	R/W		reg_int_status_clr, clear each bits of int_status register
-----	-----	--	--

#### EE\_AUDIO\_TODDR\_A\_START\_ADDR 0x42

Bits	R/W	Default	Description
31:0	R/W	0x00000000	start_addr, buff_A start address, ignore [2:0]

#### EE\_AUDIO\_TODDR\_A\_FINISH\_ADDR 0x43

Bits	R/W	Default	Description
31:0	R/W	0x00000000	finish_addr, buff_A finish address, ignore [2:0]

#### EE\_AUDIO\_TODDR\_A\_INT\_ADDR 0x44

Bits	R/W	Default	Description
31:0	R/W	0x00000000	int_addr, usage A : as an address of interrupt; usage B : as a count of interrupt;

#### EE\_AUDIO\_TODDR\_A\_STATUS1 0x45

Bits	R/W	Default	Description
19	R/W	0x00000000	sel_b_true
18	R/W		sel_b

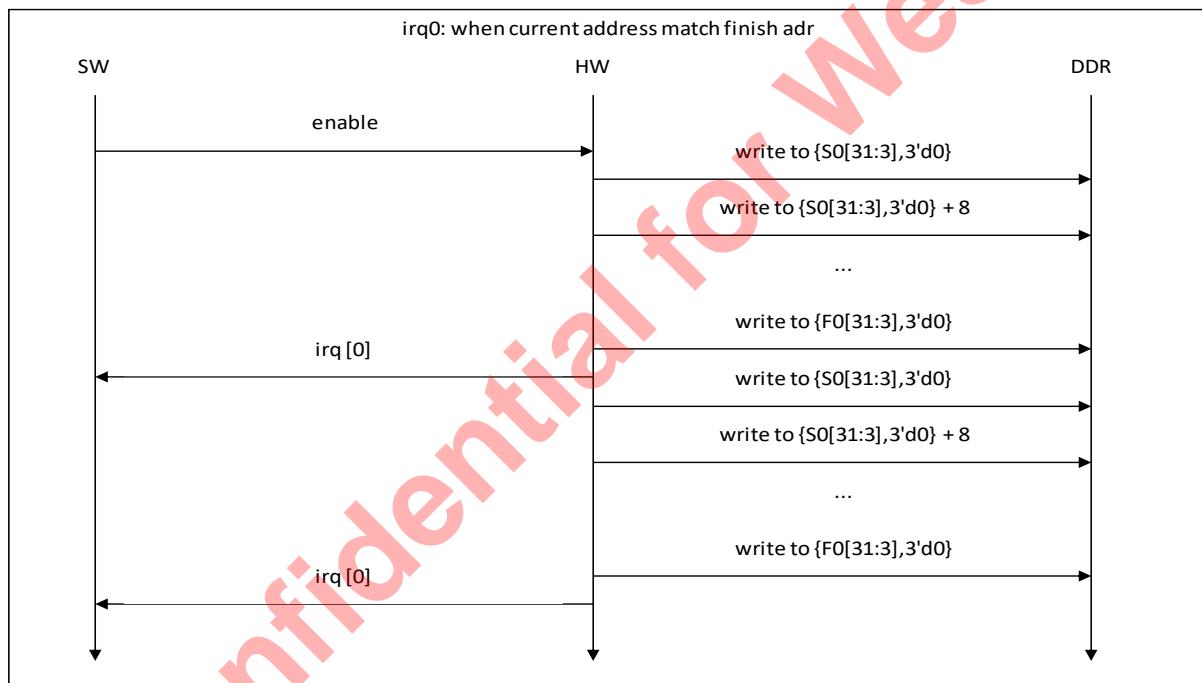

Bits	R/W	Default	Description
16:8	R/W		fifo count, the num in fifo
7:0	R/W		int_status, when irq generate, related bit will changed to 1 and can only clear by reg_int_status_clr

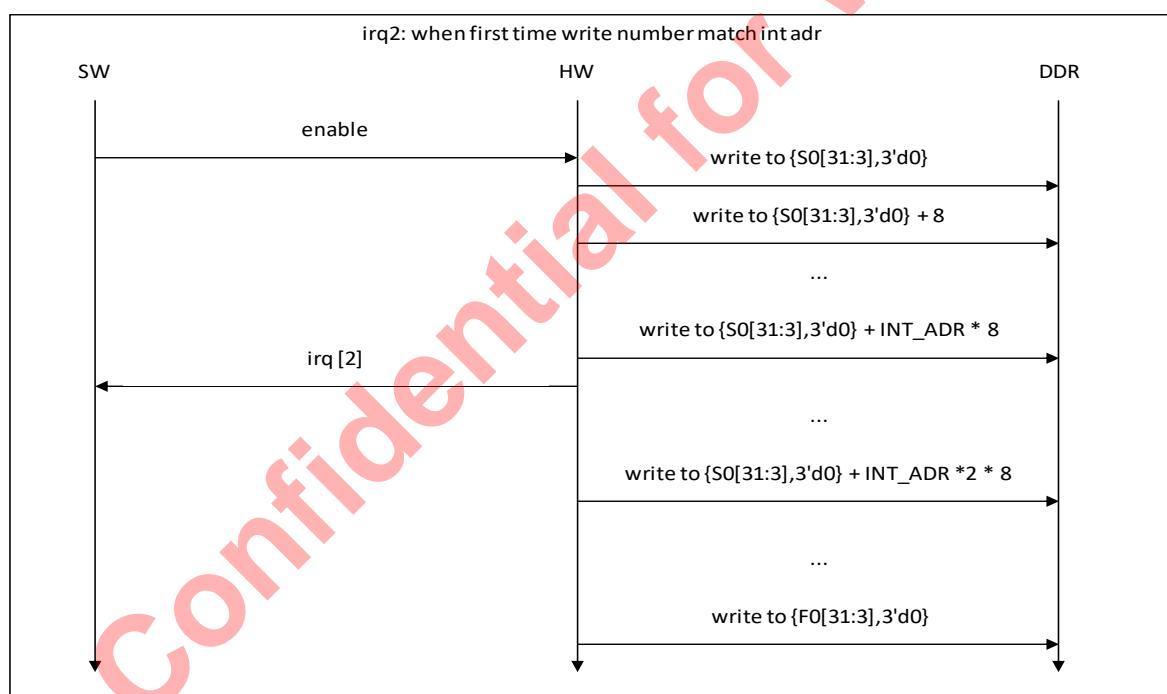

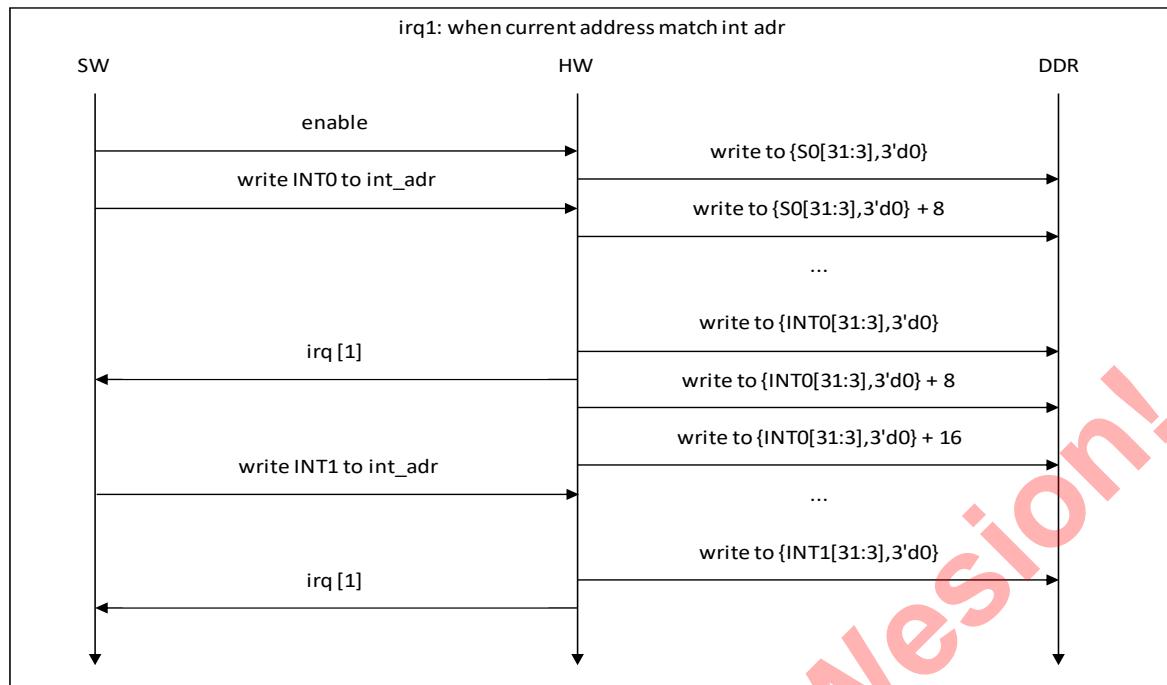

**EE\_AUDIO\_TODDR\_A\_STATUS2 0x46**

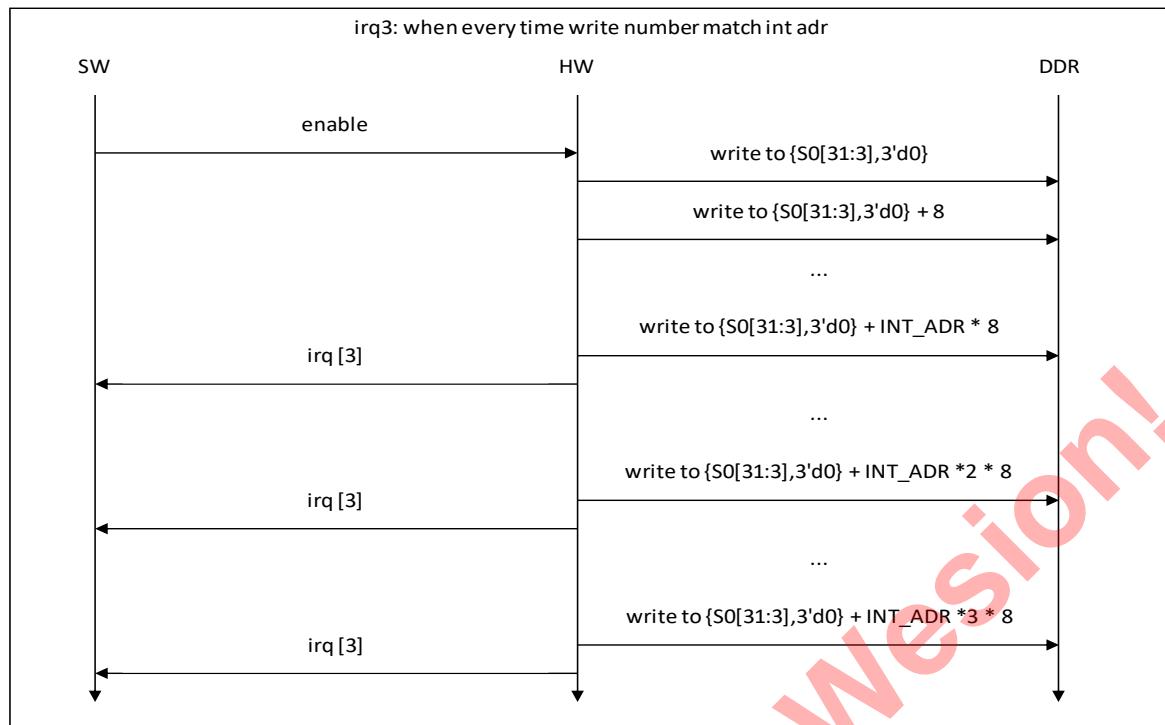

Bits	R/W	Default	Description
31:0	R/W	0x00000000	status2, by reg_status_sel: 0: current ddr write address; 1: next finish address; 2: count by ddr reply, current ddr write address; 3: count by ddr reply, next finish address;

We can generate 8 irq and add them together to CPU.

Then can read int\_status to know it's which irq:

#### **EE\_AUDIO\_TODDR\_A\_START\_ADDRB 0x47**

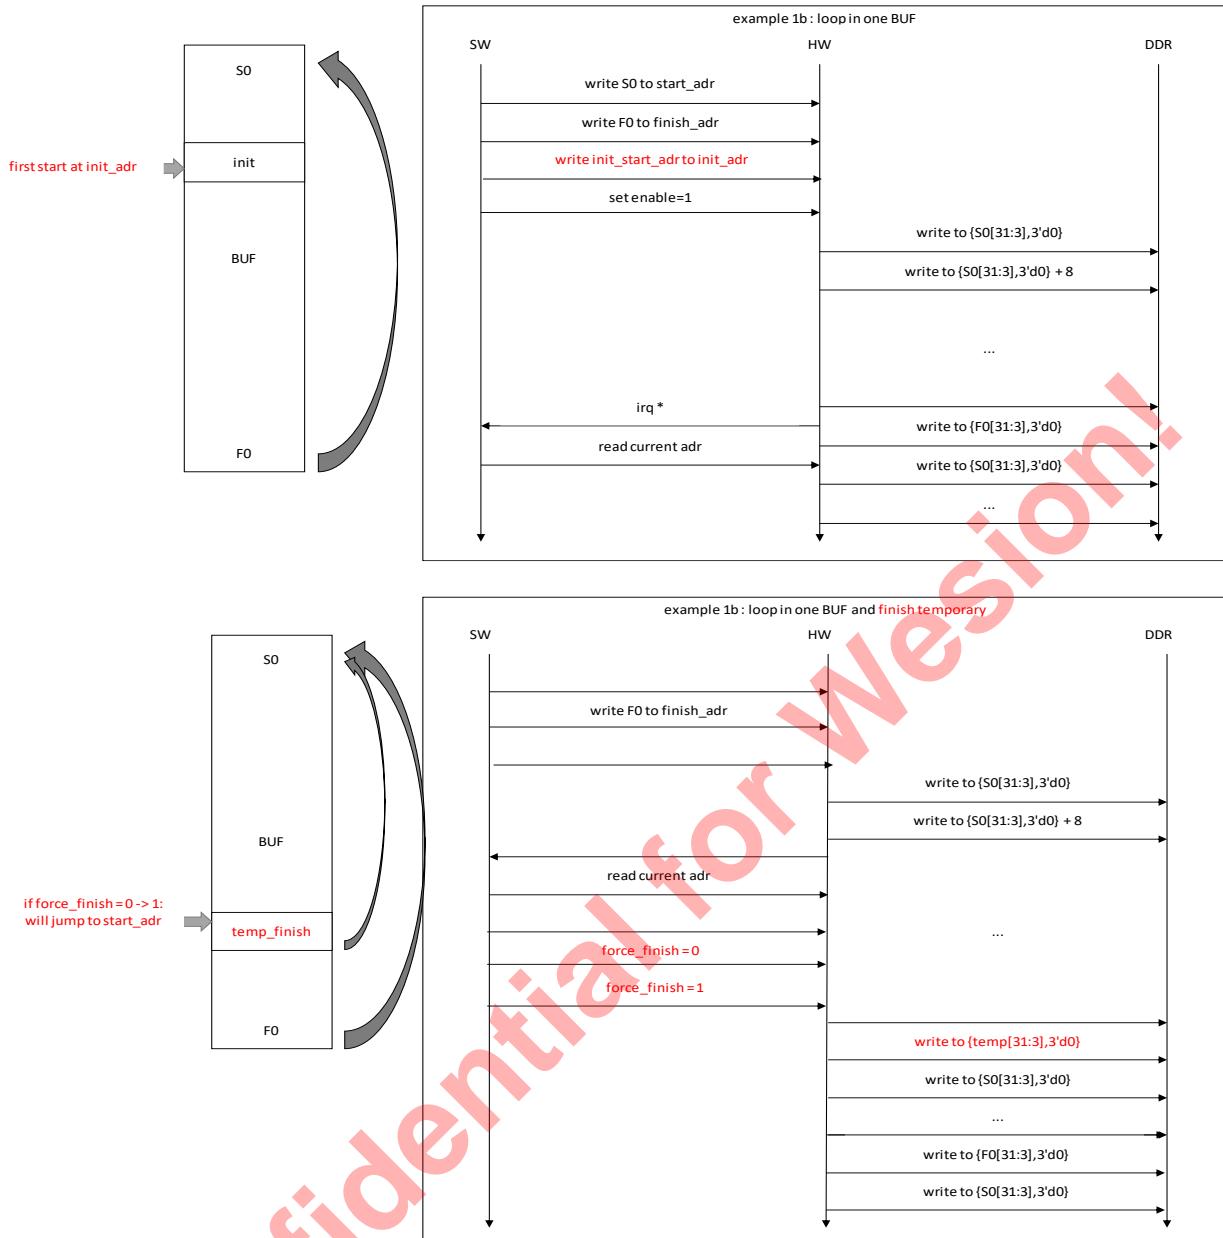

Bits	R/W	Default	Description
31:0	R/W	0x00000000	istart_addrb, buff_B start address, ignore [2:0]

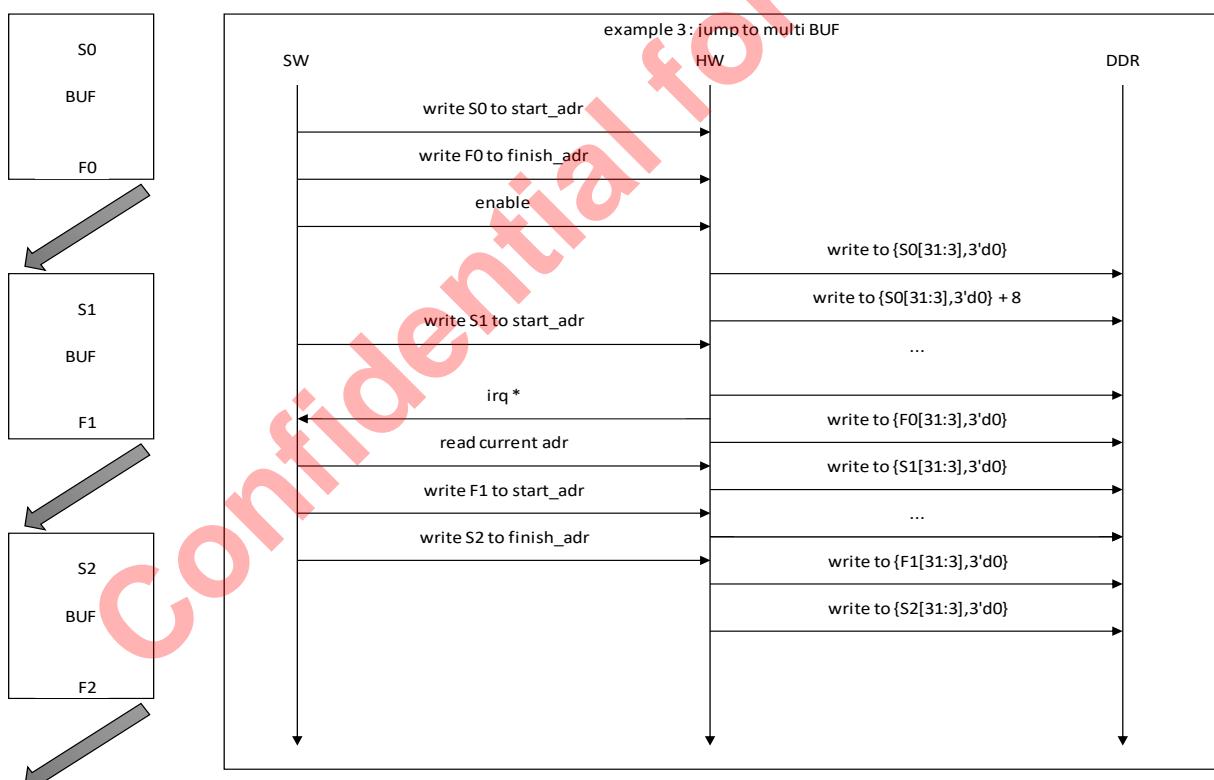

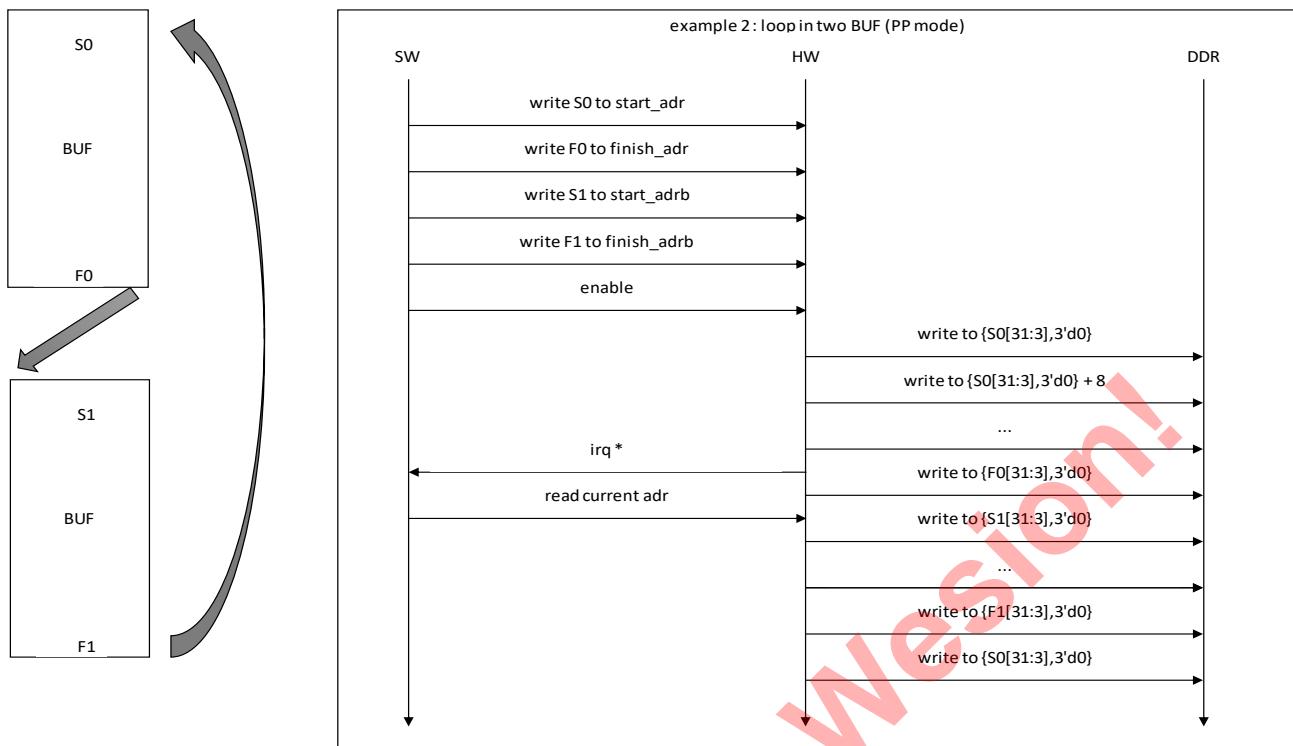

#### **EE\_AUDIO\_TODDR\_A\_FINISH\_ADDRB 0x48**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	finish_addrb, buff_B finish address, ignore [2:0]

#### **EE\_AUDIO\_TODDR\_A\_INIT\_ADDR 0x49**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	initial address, the first ddr address after enable

**EE\_AUDIO\_TODDR\_B\_CTRL0** 0x50  
**EE\_AUDIO\_TODDR\_B\_CTRL1** 0x51  
**EE\_AUDIO\_TODDR\_B\_START\_ADDR** 0x52  
**EE\_AUDIO\_TODDR\_B\_FINISH\_ADDR** 0x53  
**EE\_AUDIO\_TODDR\_B\_INT\_ADDR** 0x54  
**EE\_AUDIO\_TODDR\_B\_STATUS1** 0x55  
**EE\_AUDIO\_TODDR\_B\_STATUS2** 0x56  
**EE\_AUDIO\_TODDR\_B\_START\_ADDRB** 0x57  
**EE\_AUDIO\_TODDR\_B\_FINISH\_ADDR** 0x58  
**EE\_AUDIO\_TODDR\_B\_INIT\_ADDR** 0x59  
**EE\_AUDIO\_TODDR\_C\_CTRL0** 0x60  
**EE\_AUDIO\_TODDR\_C\_CTRL1** 0x61  
**EE\_AUDIO\_TODDR\_C\_START\_ADDR** 0x62  
**EE\_AUDIO\_TODDR\_C\_FINISH\_ADDR** 0x63  
**EE\_AUDIO\_TODDR\_C\_INT\_ADDR** 0x64  
**EE\_AUDIO\_TODDR\_C\_STATUS1** 0x65  
**EE\_AUDIO\_TODDR\_C\_STATUS2** 0x66  
**EE\_AUDIO\_TODDR\_C\_START\_ADDRB** 0x67  
**EE\_AUDIO\_TODDR\_C\_FINISH\_ADDR** 0x68  
**EE\_AUDIO\_TODDR\_C\_INIT\_ADDR** 0x69

#### 11.9.4 FRDDR Registers

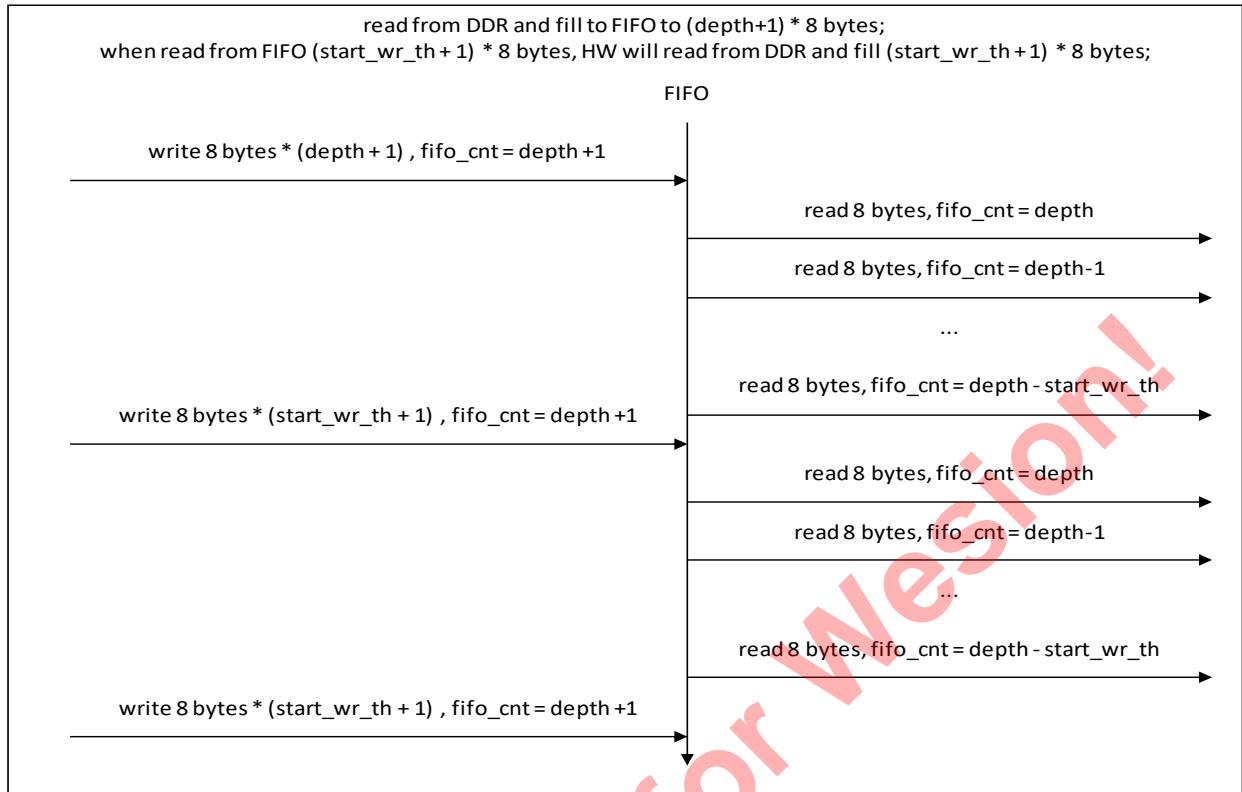

**EE\_AUDIO\_FRDDR\_A\_CTRL0** 0x70

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_frddr_en, 0: disable; 1: enable;
30	R/W		reg_frddr_pp_mode, 0: select write to only one buff (start_addr,finish_addr); 1: select write to two buff (start_addr,finish_addr) (start_addrb, finish_addrb);
26:24	R/W		reg_frdd_endian
23:16	R/W		reg_frddr_int_en, [23] : reserved; [22] : reserved; [21] : fifo overflow, write when fifocnt = depth; [20] : fifo overflow, read when fifocnt = 0; [19] : first time when read from ddr "int_addr" data(only once); [18] : once time when read from ddr "int_addr" data(repeat); [17] : when read from ddr address match "int_addr"; [16]: when read from ddr address match "finish_addr";
15:12	R/W		reg_frddr_ack_dly, add delay to frddr ack
11	R/W		Reg_frddr_src_sel3_en; 0: ignorereq_src_sel3; 1: waitreq_src_sel3;

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10:8	R/W		reg_frddr_src_sel3, 0: tdmout_a; 1: tdmout_b; 2: tdmout_c; 3: spdifout; 4: spdifout_b; 5: reserved; 6: reserved; 7: reserved;
7	R/W		Reg_frddr_src_sel2_en; 0: ignorereq_src_sel2; 1: waitreq_src_sel2;
6:4	R/W		reg_frddr_src_sel2, 0: tdmout_a; 1: tdmout_b; 2: tdmout_c; 3: spdifout; 4: spdifout_b; 5: reserved; 6: reserved; 7: reserved;
3	R/W		Reg_frddr_src_sel1_en; 0: ignorereq_src_sel1; 1: waitreq_src_sel1;
2:0	R/W		reg_frddr_src_sel1, 0: tdmout_a; 1: tdmout_b; 2: tdmout_c; 3: spdifout; 4: spdifout_b; 5: reserved; 6: reserved; 7: reserved;

**EE\_AUDIO\_FRDDR\_A\_CTRL1 0x71**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	reg_fifo_depth, the max depth of fifo; for high bit rates like 384k*32bits*8ch, set this register higher; for low bit rates like 48k*32bits*2ch, set this register lower;
23:16			reg_fifo_start_wr_th, when the fifo cnt less than "reg_fifo_depth - reg_fifo_start_wr_th", start request and read data from DDR; each time request "reg_fifo_start_wr_th" * 8 bytes data;
12			force finish; when the value changed from 0 to 1; will finished by current address and jump to start address;
11:8			reg_status_sel, control status2 source;
7:0			reg_int_status_clr, clear each bits of int_status register

**EE\_AUDIO\_FRDDR\_A\_START\_ADDR 0x72**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	start_addr,buff_B start address

**EE\_AUDIO\_FRDDR\_A\_FINISH\_ADDR 0x73**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	finish_addr,buff_B finish address

**EE\_AUDIO\_FRDDR\_A\_INT\_ADDR 0x74**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	int_addr,usage A : as an address of interrupt; usage B : as a count of interrupt;

**EE\_AUDIO\_FRDDR\_A\_STATUS1 0x75**

Bits	R/W	Default	Description
19	R/W	0x00000000	r_selb_true
18	R/W		r_selb
17:8	R/W		fifo count, the num in fifo

7:0	R/W		int_status, when irq generate, related bit will changed to 1 and can only clear by reg_int_status_clr
-----	-----	--	---

**EE\_AUDIO\_FRDDR\_A\_STATUS2 0x76**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	status2, by reg_status_sel: 0: current ddr write address; 1: next finish address; 2: count by ddr reply, current ddr write address; 3: count by ddr reply, next finish address;

The same design as TODDR:

We can generate 8 irq and add them together to CPU.

Then can read int\_status to know it's which irq.

**EE\_AUDIO\_FRDDR\_A\_START\_ADDRB 0x77****EE\_AUDIO\_FRDDR\_A\_FINISH\_ADDRB 0x78**

The same design as TODDR:

We have an internal register to store reg\_start\_adr and reg\_finish\_adr.

We call them as r\_start\_adr and r\_finish\_adr;

Each time, when curr\_adr match r\_finish\_adr, curr\_adr will jump to r\_start\_adr , then update r\_start\_adr and r\_finish\_adr;

That's mean SW can write new start adr and finish adr before curr\_adr match old finish adr .

**EE\_AUDIO\_FRDDR\_A\_INIT\_ADDR 0x79**

EE\_AUDIO\_FRDDR\_B\_CTRL0 0x80  
 EE\_AUDIO\_FRDDR\_B\_CTRL1 0x81  
 EE\_AUDIO\_FRDDR\_B\_START\_ADDR 0x82  
 EE\_AUDIO\_FRDDR\_B\_FINISH\_ADDR 0x83  
 EE\_AUDIO\_FRDDR\_B\_INT\_ADDR 0x84  
 EE\_AUDIO\_FRDDR\_B\_STATUS1 0x85  
 EE\_AUDIO\_FRDDR\_B\_STATUS2 0x86  
 EE\_AUDIO\_FRDDR\_B\_START\_ADDRB 0x87  
 EE\_AUDIO\_FRDDR\_B\_FINISH\_ADDR 0x88  
 EE\_AUDIO\_FRDDR\_B\_INIT\_ADDR 0x89  
 EE\_AUDIO\_FRDDR\_C\_CTRL0 0x90  
 EE\_AUDIO\_FRDDR\_C\_CTRL1 0x91  
 EE\_AUDIO\_FRDDR\_C\_START\_ADDR 0x92  
 EE\_AUDIO\_FRDDR\_C\_FINISH\_ADDR 0x93  
 EE\_AUDIO\_FRDDR\_C\_INT\_ADDR 0x94  
 EE\_AUDIO\_FRDDR\_C\_STATUS1 0x95  
 EE\_AUDIO\_FRDDR\_C\_STATUS2 0x96  
 EE\_AUDIO\_FRDDR\_C\_START\_ADDRB 0x97  
 EE\_AUDIO\_FRDDR\_C\_FINISH\_ADDR 0x98  
 EE\_AUDIO\_FRDDR\_C\_INIT\_ADDR 0x99

### 11.9.5 DDR ARB Registers

EE\_AUDIO\_ARB\_CTRL 0xa0

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_arb_en, 0:disable; 1: enable;
7:0	R/W		reg_arb_mask, [7]: reserved; [6]: frddr_c; [5]: frddr_b; [4]: frddr_a; [3]: reserved; [2]: toddr_c; [1]: toddr_b; [0]: toddr_a;

### 11.9.6 LoopBack Registers

EE\_AUDIO\_LB\_CTRL0 0xb0

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_lb_en, 0:disable; 1: enable;

30	R/W		reg_lb_mode, 0: out rate = in data rate; 1: out rate = loopback data rate;
29	R/W		reg_ext_signed, 0: extend bits as "0"; 1: extend bits as "msb";
28	R/W		Enable_sync_chnum; 1: start store data when ch_num can match ID;
27	R/W		chnum_en; 1: start send new ch num out;
26:24	R/W		reg_dat_chnum, max channel number of in data;
23:16	R/W		reg_dat_mask, mask each channel of in data;
15:13	R/W		reg_dat_sel, shift [m:n] to [31:0]; 0: right justified, out = { ext,[m:n]}; 1: left justified, out = {[m:n],all0}; 2: right justified, out = { ext,[m:n]}; 3: left justified, out = {[m:n],all0}; 4: right justified, out = { ext,[m:n]};
12:8	R/W		reg_dat_m_sel, the msb positioin in data
7:3	R/W		reg_dat_n_sel, the lsb position in data
2:0	R/W		reg_dat_src_sel, [7]: reserved; [6]: reserved; [5]: reserved; [4]: pdmin; [3]: spdifin; [2]: tdmr_c; [1]: tdmr_b; [0]: tdmr_a;

**EE\_AUDIO\_LB\_CTRL1****0xb1**

Bits	R/W	Default	Description
29	R/W	0x00000000	reg_lb_ext_signed, 0: extend bits as "0"; 1: extend bits as "msb";
28	R/W		Enable_sync_chnum; 1: start store data when ch_num can match ID;
27	R/W		hold_insertion 1: hold insert data store(update) and insert 0 after original data;
26:24			reg_lb_chnum, max channel number of loopback data;
23:16			reg_lb_mask, mask each channel of loopback data;
15:13			reg_lb_sel, shift [m:n] to [31:0]; 0: right justified, out = {ext,[m:n]}; 1: left justified, out = {[m:n],all0}; 2: right justified, out = { ext,[m:n]}; 3: left justified, out = {[m:n],all0}; 4: right justified, out = { ext,[m:n]};

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12:8			reg_lb_m_sel, the msb position loopback data
7:3			reg_lb_n_sel, the lsb position loopback data

**EE\_AUDIO\_DAT\_ID0 0xb2**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	data_ch7_id
23:16	R/W		data_ch6_id
15:8	R/W		data_ch5_id
7:0	R/W		data_ch4_id

**EE\_AUDIO\_DAT\_ID1 0xb3**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	data_ch3_id
23:16	R/W		data_ch2_id
15:8	R/W		data_ch1_id
7:0	R/W		data_ch0_id

**EE\_AUDIO\_LB\_ID0 0xb4**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	lb_data_ch7_id
23:16	R/W		lb_data_ch6_id
15:8	R/W		lb_data_ch5_id
7:0	R/W		lb_data_ch4_id

**EE\_AUDIO\_LB\_ID1 0xb5**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	lb_data_ch3_id
23:16	R/W		lb_data_ch2_id
15:8	R/W		lb_data_ch1_id
7:0	R/W		lb_data_ch0_id

**EE\_AUDIO\_LB\_STS 0xb6**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27	R	0x00000000	output_en_err; when output, received a new start;

26	R		insert_storing_err2; if it's receiving, but received first ch;
25	R		insert_storing_err1, if it's not receiving, but received data
24	R		orig_storing_err2; if it's receiving, but received first ch;
23	R		orig_storing_err1, if it's not receiving, but received data
22	R		orig_updated, mean it's finished updated;
21	R		insert_storing, mean it's receiving insert data now;
20	R		orig_storing, mean it's receiving insert data now;
19	R		insert_store_cnt_err, when first_ch, if store_cnt is not 0, mean error, missed ch or another reason;
18:10	R		insert_store_cnt_debug[8:0], when first_ch, store current store_cnt value;
9	R		orig_store_cnt_err, when first_ch, if store_cnt is not 0, mean error, missed ch or another reason;
8:0	R		orig_store_cnt_debug[8:0], when first_ch, store current store_cnt value;

### 11.9.7 TDM Registers

TDMIn\_B/C are the same as TDMIn\_A.

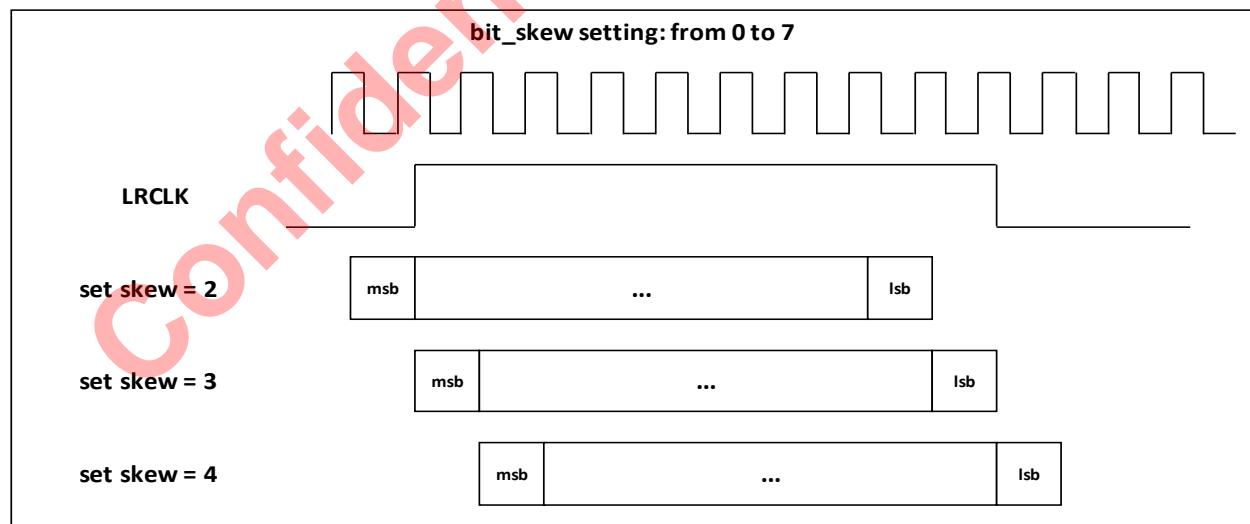

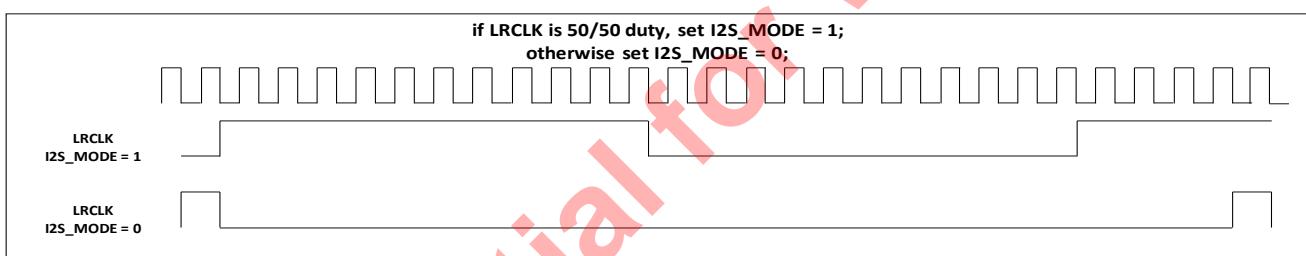

TDMout\_B/C are the same as TDMout\_A.

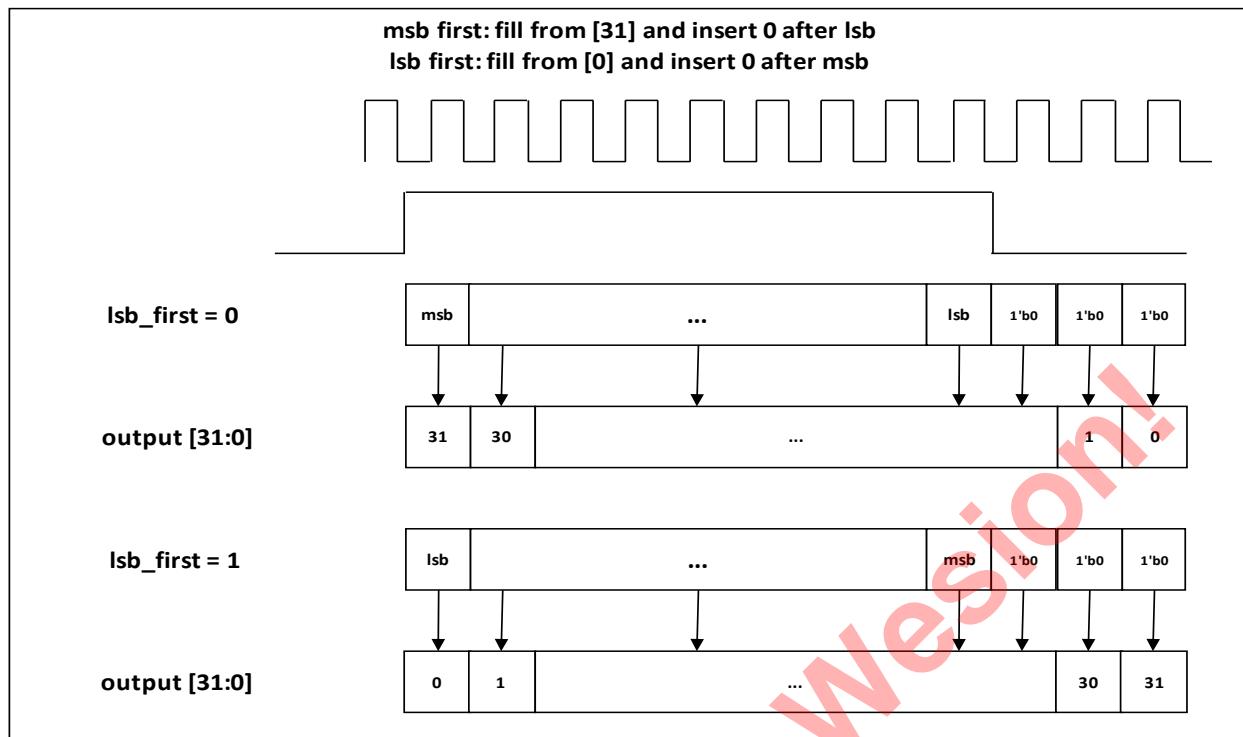

TDMIn\_LB is the same as TDMIn\_A.

#### EE\_AUDIO\_TDMIN\_A\_CTRL 0xc0

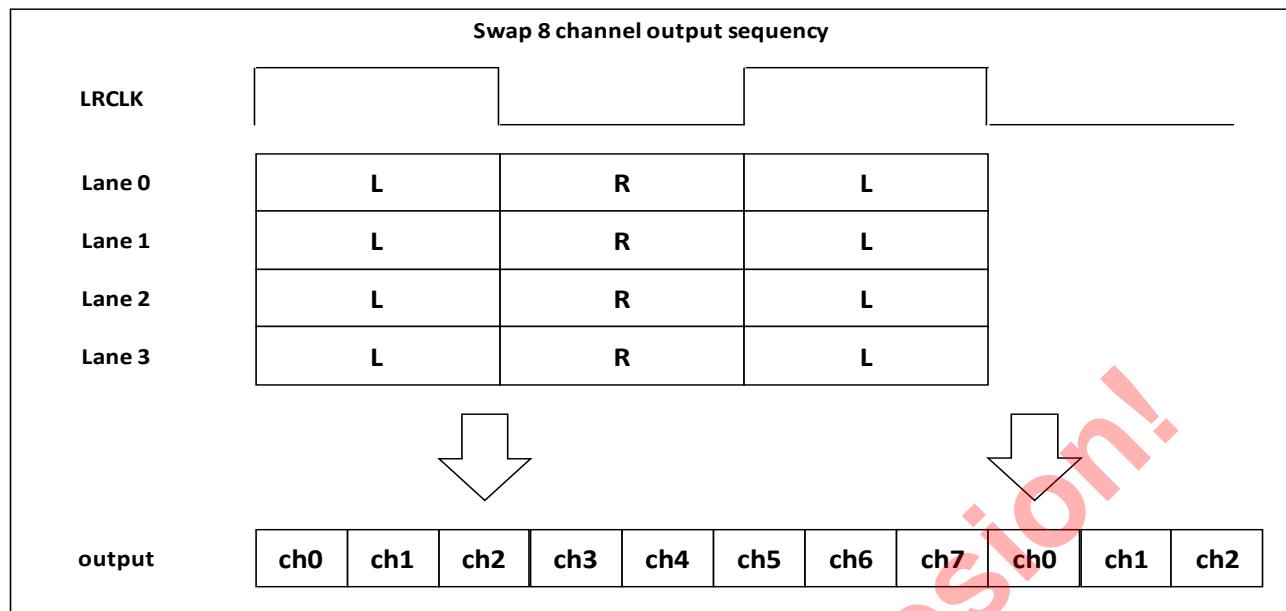

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_work_enable 0:disable; 1:enable;
30	R/W		reg_i2s_mode,0:tdm mode; 1: i2s mode;
29	R/W		reg_RST_AFIFO_OUT_N, reset afifo out side; need set to 1 before reg_RST_AFIFO_IN_N;
28	R/W		reg_RST_AFIFO_IN_N, reset afifo in side; need set 1 after set reg_RST_AFIFO_OUT_N to 1;
27	R/W		reg_tadmin_in_debug_en, 0: disable debug mode; 1: enable;
26	R/W		reg_tadmin_in_auto_en,0: disalbe; 1: enable detect and store max/min of bit_cnt ;
25	R/W		reg_tadmin_in_rev_ws, revert ws(lrclock); 0 :disable; 1: enable;
24	R/W		reg_tadmin_in_rev_dat, revert data; 0:disable; 1:enable;

Bits	R/W	Default	Description
23:20	R/W		select tadmin src; 0: PAD_TDMINA; //for tadmin_lb, it's tdmoutA 1: PAD_TDMINB; //for tadmin_lb, it's tdmoutB 2: PAD_TDMINC; //for tadmin_lb, it's tdmoutC 3: TDMOUTA; //for tadmin_lb, it's pad_tdmoutA 4: TDMOUTB; //for tadmin_lb, it's pad_tdmoutB 5: TDMOUTC; //for tadmin_lb, it's pad_tdmoutC
18:16	R/W		reg_tadmin_in_bit_skew, add delay to ws or data for skew modification;
6	R/W		chnum_en; 1: add ch cnt to chnum;
5	R/W		reg_lsb_first, 0: store first bit received to data_store[0]; 1: store first bit received to data_store[31];
4:0	R/W		reg_tadmin_bit_num, bitwidth of each slot, if slot is 16bits, set this register to 15;

**EE\_AUDIO\_TDMIN\_A\_SWAP 0xc1**

Bits	R/W	Default	Description
30:28	R/W	0x00000000	ch7_sel, 0: lane0 left channel;
26:24	R/W		ch6_sel, 1: lane0 right channel;
22:20	R/W		ch5_sel, 2: lane1 left channel;
18:16	R/W		ch4_sel, 3: lane1 right channel;
14:12	R/W		ch3_sel, 4: lane2 left channel;
10:8	R/W		ch2_sel, 5: lane2 right channel;
6:4	R/W		ch1_sel, 6: lane3 left channel;
2:0	R/W		ch0_sel, 7: lane3 right channel;

**EE\_AUDIO\_TDMIN\_A\_MASK0 0xc2**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_lane0_mask, mask each channel in lane0, max is 32 ch;

**EE\_AUDIO\_TDMIN\_A\_MASK1 0xc3**

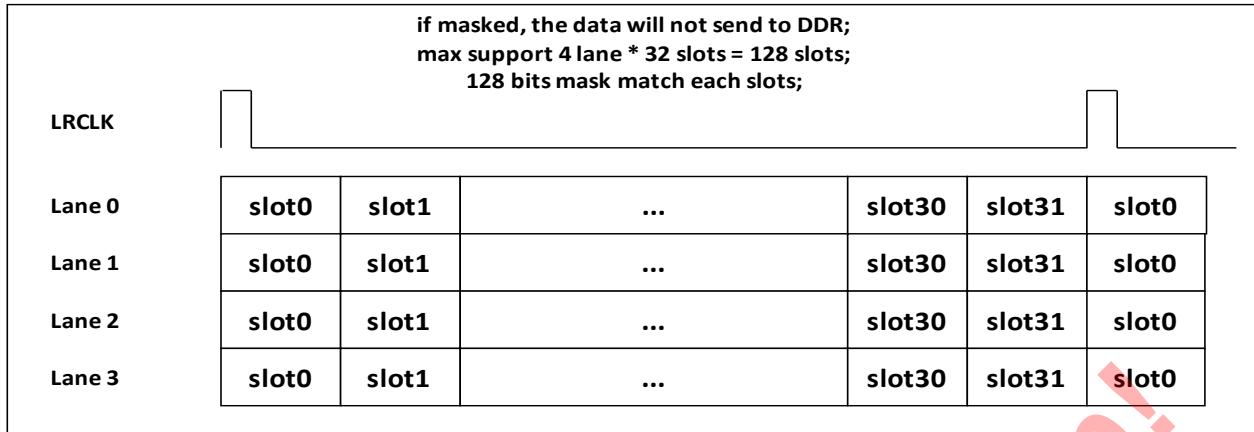

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_lane1_mask, mask each channel in lane1, max is 32 ch;

**EE\_AUDIO\_TDMIN\_A\_MASK2 0xc4**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_lane2_mask, mask each channel in lane2, max is 32 ch;

**EE\_AUDIO\_TDMIN\_A\_MASK3 0xc5**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_lane3_mask, mask each channel in lane3, max is 32 ch;

**EE\_AUDIO\_TDMIN\_A\_STAT 0xc6**

Bits	R/W	Default	Description
31:24	R/W	0x00000000	r_input_slot_cnt_max, the maxnum of slot_cnt
23:16	R/W		r_input_slot_cnt_min, the minnum of slot_cnt
14	R/W		overflow_flag, overflow flag of afifo
13:10	R/W		max_fifo_cnt, the maxnum of afifo_cnt
9:5	R/W		r_input_bit_cnt_max, the maxnum of bit_cnt
4:0	R/W		r_input_bit_cnt_min, the minnum of bit_cnt

**EE\_AUDIO\_TDMIN\_A\_MUTE\_VAL 0xc7**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_tmdin_a_mute_val, when mute , the channel value

**EE\_AUDIO\_TDMIN\_A\_MUTE0 0xc8**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_lane0_mute, mute each channel in lane0, max is 32 ch;

**EE\_AUDIO\_TDMIN\_A\_MUTE1 0xc9**

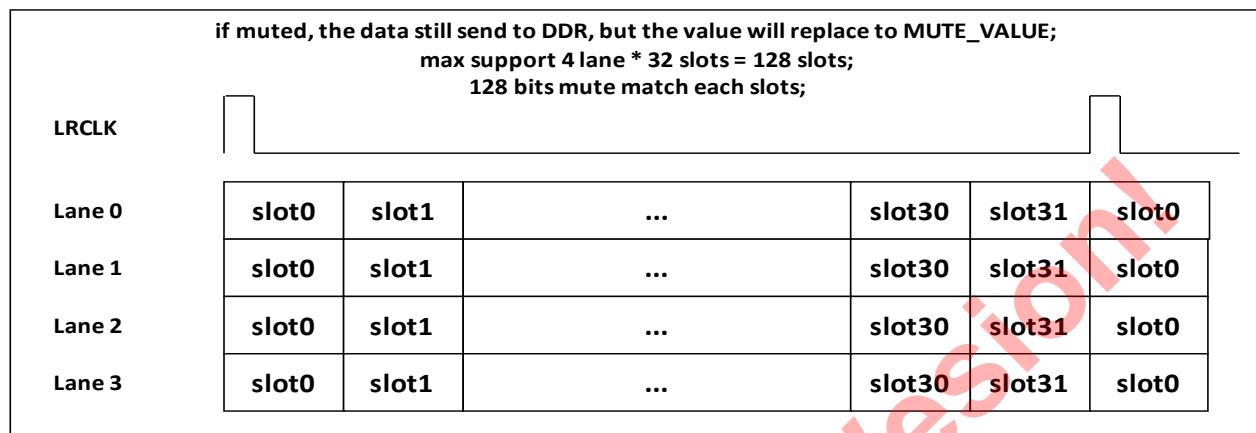

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_lane1_mute, mute each channel in lane1, max is 32 ch;

**EE\_AUDIO\_TDMIN\_A\_MUTE2 0xca**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_lane2_mute, mute each channel in lane2, max is 32 ch;

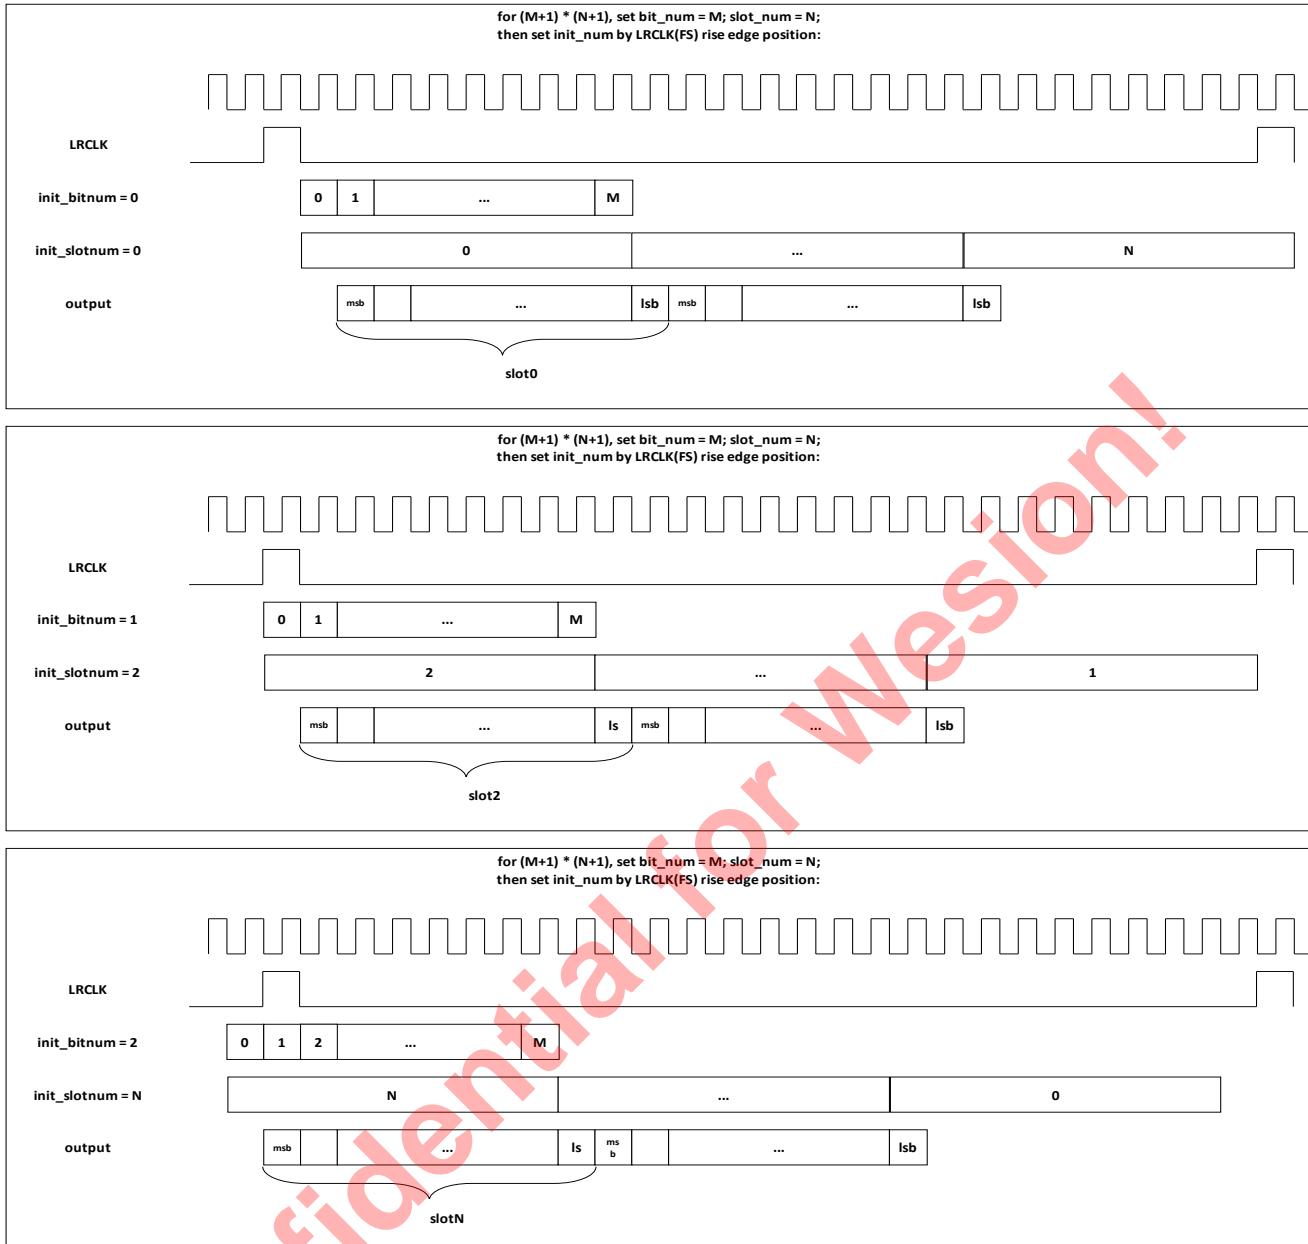

**EE\_AUDIO\_TDMIN\_A\_MUTE3 0xcb**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0x00000000	reg_lane3_mute, mute each channel in lane3, max is 32 ch;

EE\_AUDIO\_TDMOUT\_A\_CTRL0 0x140

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0x00000000	reg_work_enable, 0:disable; 1:enable;
29	R/W		reg_RST_AFIFO_OUT_N, reset afifo out side;
28	R/W		reg_RST_AFIFO_IN_N, reset afifo in side; need set 1 after set reg_RST_AFIFO_OUT_N to 1;
27:24	R/W		force_oe[3:0]; 1: oe = force_val; 0: oe = mask_val;
23:20	R/W		reg_tdm_lr_mix, [23]: mix l3 and r3;[22]: mix l2 and r2;[21]: mix l1 and r1;[20]: mix l0 and r0;
19:15	R/W		reg_tdm_init_bitnum, initial count value of bitcnt
14:10	R/W		reg_tdm_init_slotnum, initial count value of slotcnt
9:5	R/W		reg_tdmout_slot_num , max value of slotcnt; if each frame has 8 slots, set it to 7;
4:0	R/W		reg_tdmout_bit_num ,max value of bitcnt; if each slot has 16bits, set it to 15;

**EE\_AUDIO\_TDMOUT\_A\_CTRL1      0x141**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0x00000000	eq_drc_sel; 1: select eq_drc output;
30	R/W		reg_debug_en,0:disable debug feature; 1: enable;
29	R/W		reg_out_lsb_first, 0: msb first; 1: lsb first;
28	R/W		reg_rev_ws_in, revert ws; 0: disable; 1: enable;
27	R/W		reg_rev_dat, revert data; 0: disable; 1: enable;
26	R/W		reg_gain_en, 0:disable; 1: enable data * gain;

Bits	R/W	Default	Description
25:24	R/W		reg_frddr_sel, 0:frddr_A;1:frddr_B;2:frddr_C;
23:16	R/W		reg_wait_cnt, wait some time when enable set to 1;then start request data from frddr;
12:8	R/W		reg_frddr_msb, msb position of data
6:4	R/W		reg_frddr_type, 0: split 64bits ddr data to 8 sample, each sample need 8 bits; if bitwidth < 8, left-justified; 1: split 64bits ddr data to 4 sample, each sample need 16 bits; if bitwidth < 16, left-justified ; 2: split 64bits ddr data to 4 sample, each sample need 16 bits; if bitwidth < 16, right-justified ; 3: split 64bits ddr data to 2 sample, each sample need 32 bits; if bitwidth < 32, left-justified; 4: split 64bits ddr data to 2 sample, each sample need 32 bits; if bitwidth < 32, right-justified;
3:0	R/W		force_oe_val[3:0];

For position of sample in DDR:

		ddr_data [7:0] (byte)							
type		byte7	byte6	byte5	byte4	byte3	byte2	byte1	byte0
0	s7	s6	s5	s4	s3	s2	s1	s0	
	s15	s14	s13	s12	s11	s10	s9	s8	
1/2	s3		s2		s1		s0		
	s7		s6		s5		s4		
3/4		s1			s0				
		s3			s2				

For encoder, it will start output[31] first, then output[30], finished at output[32-bit\_num];

If lsb\_first, will start s[0], then s[1], finished at s[bit\_num+1];

		output [31:0] (bit)

### 11.9.8 SPDIFRegisters

EE\_AUDIO\_SPDIFIN\_CTRL0 0x100

Bits	R/W	Default	Description

31	R/W	0x00000000	reg_work_enable, 0: disable; 1:enable;
29	R/W		reg_RST_AFIFO_OUT_N, reset afifo out side;
28	R/W		reg_RST_AFIFO_IN_N, reset afifo in side; need set 1 after set reg_RST_AFIFO_OUT_N to 1;
27	R/W		reg_debug_en, 0:disable debug; 1: enable;
26	R/W		reg_chunm_en; 1: start add ch_cnt to ch_num;
25	R/W		reg_findpapb_en, 0: disable NonPCM mode; 1: enable;
24	R/W		reg_width_sel, 0: detect sample mode by max_width;1: detect sample mode by min_width;
23:12	R/W		reg_nonpcm2pcm_th, when detected NonPcm mode;if long time (z_cnt >= th) didn't detect PaPb again, will generate interrupt to SW: now changed to PCM mode;
11:8	R/W		reg_ch_status_sel, For EE_AUDIO_SPDIFIN_STAT1
7	R/W		reg_mute_l, 0: disable ; 1: mute channel L;
6	R/W		reg_mute_r, 0: disable ; 1: mute channel R;
5:4	R/W		reg_spdifin_src_sel, 0: PAD of spdifin;1: spdifout;
3	R/W		reg_check_valid, 0: disable valid check ; 1: enable;
2	R/W		reg_check_parity, 0: disable parity check ; 1: enable;
1	R/W		reg_invert_data, 0: disalbe; 1: invert [27:4] to [4:27];
0	R/W		reg_spdifin_phase, 0: disable invert; 1: enable;

**EE\_AUDIO\_SPDIFIN\_CTRL1 0x101**

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_force_sample_mode, 0: auto detect sample mode; 1: force a fixed sample mode;
30:28	R/W		reg_sample_mode
27:20	R/W		reg_interrupt_mask, mask each interrupt;
19:0	R/W		reg_base_timer, define a base timer to detect sample mode changed;

**EE\_AUDIO\_SPDIFIN\_CTRL2 0x102**

Bits	R/W	Default	Description
29:20	R/W	0x00000000	reg_sample_mode0_timer_th
19:10	R/W		reg_sample_mode1_timer_th
9:0	R/W		reg_sample_mode2_timer_th

**EE\_AUDIO\_SPDIFIN\_CTRL3 0x103**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:20	R/W	0x00000000	reg_sample_mode3_timer_th
19:10	R/W		reg_sample_mode4_timer_th
9:0	R/W		reg_sample_mode5_timer_th

**EE\_AUDIO\_SPDIFIN\_CTRL4 0x104**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	reg_sample_mode0_timer
23:16	R/W		reg_sample_mode1_timer
15:8	R/W		reg_sample_mode2_timer
7:0	R/W		reg_sample_mode3_timer

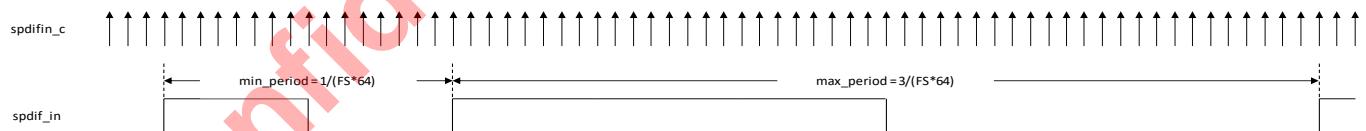

**EE\_AUDIO\_SPDIFIN\_CTRL5 0x105**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	reg_sample_mode4_timer
23:16	R/W		reg_sample_mode5_timer
15:8	R/W		reg_sample_mode6_timer

We need automatically detect the frequency of sample rate (FS).

It will done by search min\_period or max\_period of SPDIF IN and compared to thresholds.

We can support 7 mode settings.

For example:

If spdifin\_clk is 166MHz, and we want support 48KHz and 96KHz.

The min\_period of 48KHz is  $1/(48000 \times 64)$  and the counter number by 166MHz is  $166000000 / (48000 \times 64) = 54$ ;

96KHz counter number is  $166000000 / (96000 \times 64) = 27$ ;

Then set:

```
Width_sel = 1;
Mode0_th = (54+27)/2 = 41;
Mode1_th = 0;
Mode0_timer = 27;
Mode1_timer = 13;
```

Or:

```
Width_sel = 0;
Mode0_th = (162+81)/2 = 121;
Mode1_th = 0;
Mode0_timer = 27;
Mode1_timer = 13;
```

More example:

<b>spdifin_clk = 166MHz</b>								
			width_sel = 1			width_sel = 0		
	FS(Hz)	timer	min_period			max_period		
mode0	24000	54	108.0729167	th0	95	324.21875	th0	283
mode1	32000	40	81.0546875	th1	70	243.1640625	th1	209
mode2	44100	29	58.81519274	th2	58	176.4455782	th2	172

### **EE\_AUDIO\_SPDIFIN\_CTRL6**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0x00000000	Reg_clr_interrupt[7:0] for each bit of irq_status[7:0];
8	R/W		reg_papb_ext_sync, 1: add ext "0" sync check for papb; 0: disable;
7:0	R/W		reg_papb_ext_mask, mask 8 channel "0" sync

### **EE\_AUDIO\_SPDIFIN\_STAT0 0x107**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30:28	R/W	0x00000000	r_sample_mode, current sample mode;
27:18	R/W		r_width_min, the min width of two edge;
17:8	R/W		r_width_max, the max width of two edge;
7:0	R/W		r_interrupt_status, interrupt status, need clear by reg_clk_interrupt; [7]: find PaPb; [6]: valid changed; [5]: find nonpcm to pcm ( reg_nonpcm2pcm_th ); [4]: find Pd changed; [3]: find Pc changed; [2]: find sample mode changed; [1]: find parity error; [0]: find overflow;

### **EE\_AUDIO\_SPDIFIN\_STAT1 0x108**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31:0	R/W	0x00000000	channel status, by reg_ch_status_sel; reg_ch_status_sel[3]: 0: channel A; 1: channel B; reg_ch_status_sel[2:0]: 0: ch_status[31:0]; 1: ch_status[63:32]; 2: ch_status[95:64]; 3: ch_status[127:96]; 4: ch_status[159:128]; 5: ch_status[191:160];
------	-----	------------	---

**EE\_AUDIO\_SPDIFIN\_STAT2 0x109**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	debug status, by reg_ch_status_sel; 0: r_z_width, the width of two preamble Z; 1: {16'd0, frame_cnt_min[7:0], frame_cnt_max[7:0]}; 2: {6'd0, width_min[9:0], 6'd0, width_max[9:0]};

**EE\_AUDIO\_SPDIFIN\_MUTE\_VAL 0x10a**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	reg_spdifin_mute_val, when muted, the channel value

**EE\_AUDIO\_SPDIFOUT\_STAT 0x120**

Bits	R/W	Default	Description
7:5	R/W	0x00000000	fifo_cnt, afifo cnt
4	R/W		up_error, change to 1 if overflow
3:0	R/W		req_frd_fsm_stat

**EE\_AUDIO\_SPDIFOUT\_GAIN0 0x121**

Bits	R/W	Default	Description
31:24	R/W	0x00000000	gain_ch3
23:16	R/W		gain_ch2
15:8	R/W		gain_ch1
7:0	R/W		gain_ch0

**EE\_AUDIO\_SPDIFOUT\_GAIN1 0x122**

Bits	R/W	Default	Description
31:24	R/W	0x00000000	gain_ch7
23:16	R/W		gain_ch6
15:8	R/W		gain_ch5

7:0	R/W		gain_ch4
-----	-----	--	----------

**EE\_AUDIO\_SPDIFOUT\_CTRL0 0x123**

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_work_enable, 0: disable ; 1: enable;
29	R/W		reg_RST_afifo_out_n, reset afifo out side;
28	R/W		reg_RST_afifo_in_n, reset afifo in side; need set 1 after set reg_RST_afifo_out_n to 1;
27	R/W		reg_hold_start_en; 1: add delay to match TDM out when share buff;
26	R/W		reg_userdata_sel, 0: "user data " = data [29]; 1: "user data" = reg_userdata_set;
25	R/W		reg_userdata_set
24	R/W		reg_chdata_sel, 0: "ch status" = data [30]; 1: "ch status" = reg_chsts0~B
23	R/W		reg_mix_lr, 0: disable; 1: L = (L+R)/2; R = (L+R)/2;
22	R/W		reg_mute_l, 0: disable; 1: ch_l_data = reg_mute_val;
21	R/W		reg_mute_r, 0: disable; 1: ch_r_data = reg_mute_val;
20	R/W		reg_data_sel, 0: insert data from 27bits; 1: insert data from 31bits;
19	R/W		reg_out_msb_first, 0: lsb first; 1: msb first;
18	R/W		reg_valid_sel, 0: "valid flag" = data [28]; 1: "valid flag" = reg_valid_set;
17	R/W		reg_valid_set
11:4	R/W		reg_mask, [11:10]: mask lane3 L/R; [9:8]: mask lane2 L/R; [7:6]: mask lane1 L/R; [5:4]: mask lane0 L/R;
3:0	R/W		reg_parity_mask, [0]: initial parity value;

**EE\_AUDIO\_SPDIFOUT\_CTRL1 0x124**

Bits	R/W	Default	Description
21	R/W	0x00000000	eq_drc_sel; 1: select eq_drc data;
26	R/W		reg_gain_en, 0:disable; 1: enable data * gain;
25:24	R/W		reg_frdrr_sel, 0:frdrr_A; 1:frdrr_B; 2:frdrr_C;
23:16	R/W		reg_wait_cnt, wait some time when enable set to 1; then start request data from frdrr;
12:8	R/W		reg_frdrr_msb, msb position of data

6:4	R/W	reg_frddr_type, 0: split 64bits ddr data to 8 sample, each sample need 8 bits; if bitwidth < 8, left-justified; 1: split 64bits ddr data to 4 sample, each sample need 16 bits; if bitwidth < 16, left-justified ; 2: split 64bits ddr data to 4 sample, each sample need 16 bits; if bitwidth < 16, right-justified ; 3: split 64bits ddr data to 2 sample, each sample need 32 bits; if bitwidth < 32, left-justified; 4: split 64bits ddr data to 2 sample, each sample need 32 bits; if bitwidth < 32, right-justified;
-----	-----	---

**EE\_AUDIO\_SPDIFOUT\_PREAMB 0x125**

Bits	R/W	Default	Description
31	R/W	0x00000000	set preamble Z, 0: preamble Z = 8'b11101000; 1: reg[7:0];
20	R/W		set preamble Y, 0: preamble Z = 8'b11100100; 1: reg[15:8];
29	R/W		set preamble X, 0: preamble Z = 8'b11100010; 1: reg[23:16];
23:16	R/W		preamble X
15:8	R/W		preamble Y
7:0	R/W		preamble Z

**EE\_AUDIO\_SPDIFOUT\_SWAP 0x126**

Bits	R/W	Default	Description
31:16	R/W	0x00000000	hold start cnt, work when CTRL0[27] = 1;
6:4	R/W		lane0 right ch sel, 0: ch0; 1: ch1; 2: ch2; 3: ch3; 4: ch4; 5: ch5; 6: ch6; 7: ch7;
2:0	R/W		lane0 left ch sel, 0: ch0; 1: ch1; 2: ch2; 3: ch3; 4: ch4; 5: ch5; 6: ch6; 7: ch7;

27			reg_sync_ch_en; 1: only select the ch data which ch_num can match ID;
23:20			reg_ram_sel, ram depth = sel * 64;
19:16			reg_downsample_sel, downsample rate = (1<<sel);
15:13			reg_dat_sel, 0: combined data[m:n] without gap; like S0[m:n],S1[m:n],S2[m:n],... 1: combined data[m:n] as 16bits; like {S0[11:0],4'd0},{S1[11:0],4'd0}... 2: combined data[m:n] as 16bits; like {4'd0,S0[11:0]},{4'd0,{S1[11:0]}}... 3: combined data[m:n] as 32bits; like {S0[27:4],8'd0},{S1[27:4],8'd0}... 4: combined data[m:n] as 32bits; like {8'd0,S0[27:4]},{8'd0,{S1[27:4]}}...
12:8			reg_dat_m_sel, the msb positioin in data
7:3			reg_dat_n_sel, the lsb position in data
2:0			reg_dat_src_sel, [7]: loopback; [6]: tadmin_lb; [5]: reserved; [4]: pdmin; [3]: spdifin; [2]: tadmin_c; [1]: tadmin_b; [0]: tadmin_a;

**EE\_AUDIO\_POW\_DET\_CTRL1 0x181**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0x00000000	reg_ch3_id

23:16			reg_ch2_id
15:8			reg_ch1_id
7:0			reg_ch0_id

**EE\_AUDIO\_POW\_DET\_TH\_HI 0x182**

Bits	R/W	Default	Description
25:0	R/W	0x00000000	hi_th, if acc_value > hi_th, status will be high

**EE\_AUDIO\_POW\_DET\_TH\_LO 0x183**

Bits	R/W	Default	Description
25:0	R/W	0x00000000	lo_th, if acc_value < lo_th, status will be low

**EE\_AUDIO\_POW\_DET\_VALUE 0x184**

Bits	R/W	Default	Description
31	R/W	0x00000000	r_status, 0: low status; 1: high status;
25:0			r_acc_data, acc_value

**11.9.11 TORAM Registers****EE\_AUDIO\_TORAM\_CTRL0 0x1c0**

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_toddr_en, 0: disable; 1: enable;
30	R/W		Reserved ;
29	R/W		reg_ext_signed, 0: select write to only one buff (start_addr,finish_addr); 1: select write to two buff (start_addr,finish_addr) (start_addrb, finish_addrb);
28	R/W		Reserved ;
27	R/W		Enable_sync_chnum; 1: start store data when first ch ;
26:24	R/W		Reserved ;
23:16	R/W		[23:18] : reserved; [17] : when write to ddr address match "int_addr"; [16]: when write to ddr address match "finish_addr";
15:13	R/W		reg_toddr_sel, 0: combined data[m:n] without gap; like S0[m:n],S1[m:n],S2[m:n],... 1: combined data[m:n] as 16bits; like {S0[11:0],4'd0},{S1[11:0],4'd0}... 2: combined data[m:n] as 16bits; like {4'd0,S0[11:0]},{4'd0,{S1[11:0]}}... 3: combined data[m:n] as 32bits; like {S0[27:4],8'd0},{S1[27:4],8'd0}... 4: combined data[m:n] as 32bits; like {8'd0,S0[27:4]},{8'd0,{S1[27:4]}}...
12:8	R/W		reg_toddr_m_sel, the msb positioin in data

Bits	R/W	Default	Description
7:3	R/W		reg_toddr_n_sel, the lsb position in data
2:0	R/W		reg_toddr_src_sel, [7]: loopback; [6]: tadmin_lb; [5]: reserved; [4]: pdmin; [3]: spdifin; [2]: tadmin_c; [1]: tadmin_b; [0]: tadmin_a;

**EE\_AUDIO\_TORAM\_CTRL1 0x1c1**

Bits	R/W	Default	Description
24	R/W	0x00000000	Insert_chnum; 0: disable; 1: insert chnum[9:0] to data[9:0]
23:16	R/W		Reserved ;
11:8	R/W		reg_status_sel, control status2 source;
7:0	R/W		reg_int_status_clr, clear each bits of int_status register

**EE\_AUDIO\_TORAM\_START\_ADDR 0x1c2**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	start_addr, buff_A start address, ignore [2:0]

**EE\_AUDIO\_TORAM\_FINISH\_ADDR 0x1c3**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	finish_addr, buff_A finish address, ignore [2:0]

**EE\_AUDIO\_TORAM\_INT\_ADDR 0x1c4**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	int_addr, usage A : as an address of interrupt; usage B : as a count of interrupt;

**EE\_AUDIO\_TORAM\_STATUS1 0x1c5**

Bits	R/W	Default	Description
7:0	R/W	0x00000000	int_status, when irq generate, related bit will changed to 1 and can only clear by reg_int_status_clr

**EE\_AUDIO\_TORAM\_STATUS2 0x1c6**

Bits	R/W	Default	Description

31:0	R/W	0x00000000	status2, by reg_status_sel: 0: current write ram times; 1: current write ram address;
------	-----	------------	---

**EE\_AUDIO\_TORAM\_INIT\_ADDR 0x1c7**

Bits	R/W	Default	Description
31:0	R/W	0x00000000	first RAM address after enable set to 1;

**11.9.12 TOACODEC Registers****EE\_AUDIO\_TOACODEC\_CTRL0 0x1d0**

Bits	R/W	Default	Description
31	R/W	0x00000000	reg_toacodec_en, 0: disable; 1: enable;
15:12	R/W		dat_sel: 0: tdmout_a_dat[0]; 1: tdmout_a_dat[1]; 2: tdmout_a_dat[2]; 3: tdmout_a_dat[3]; 4: tdmout_b_dat[0]; 5: tdmout_b_dat[1]; 6: tdmout_b_dat[2]; 7: tdmout_b_dat[3]; 8: tdmout_c_dat[0]; 9: tdmout_c_dat[1]; 10: tdmout_c_dat[2]; 11: tdmout_c_dat[3];
9:8	R/W		lrclk_sel: 0: tdmout_a_lrclk; 1: tdmout_b_lrclk; 2: tdmout_c_lrclk;
7	R/W		Bclk_cap_inv: The dat_o and lrclk_o will captured for timing balance after select; If this bit set to 1, will use invert bclk to capture;
6	R/W		Bclk_o_inv: if set 1, the final bclk connect to acodec will invert;
5:4	R/W		Bclk_sel: 0: tdmout_a_bclk; 1: tdmout_b_bclk; 2: tdmout_c_bclk;

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
2:0	R/W		Mclk_sel: 0:mst_mclk_a; 1:mst_mclk_b; 2:mst_mclk_c; 3:mst_mclk_d; 4:mst_mclk_e; 5:mst_mclk_f;

### 11.9.13 TOHDMITX Registers

**EE\_AUDIO\_TOHDMITX\_CTRL0 0x1d0**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0x00000000	reg_toacodec_en, 0: disable; 1: enable;
13:12	R/W		dat_sel: 0: tdmout_a_dat; 1: tdmout_b_dat; 2: tdmout_c_dat;
9:8	R/W		Irclk_sel: 0: tdmout_a_irclk; 1: tdmout_b_irclk; 2: tdmout_c_irclk;
7	R/W		Bclk_cap_inv: The dat_o and Irclk_o will captured for timing balance after select; If this bit set to 1, will use invert bclk to capture;
6	R/W		Bclk_o_inv: if set 1, the final bclk connect to acodec will invert;
5:4	R/W		Bclk_sel: 0: tdmout_a_bclk; 1: tdmout_b_bclk; 2: tdmout_c_bclk;
3	R/W		Spdif_clk_cap_inv: The spdif_dat will captured for timing balance after select; If this bit set to 1, will use invert spdif_clk to capture;
2	R/W		Spdif_clk_o_inv: if set 1, the final bclk connect to hdmitx will invert;

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
1	R/W		Spdif_sel: 0:spdif_out; 1:spdif_out_b;
0	R/W		Spdif_clk_sel: 0:spdif_clk; 1:spdif_clk_b;

### 11.9.14 Audio Locker Register

Base Address: FF64A000

Each register final address = module base address+ address \* 4

#### AUD\_LOCK\_EN 0X00

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1			reserved
0	R/W	0x0	Audio_lock_en: 0 = disable; 1= enable.

#### AUD\_LOCK\_SW\_RESET 0X01

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:1			reserved
0	R/W	0x0	Audio_lock_soft_reset: 1=generate soft reset pulse

#### AUD\_LOCK\_SW\_LATCH 0X02

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4			reserved
3	R/W	0x0	omclk2ref software latch: 1= generate the latch pulse
2	R/W	0x0	Ref2omclk software latch: 1= generate the latch pulse
1	R/W	0x0	Ref2imclk software latch: 1= generate the latch pulse
0	R/W	0x0	Imclk2ref software latch: 1= generate the latch pulse

#### AUD\_LOCK\_HW\_LATCH 0X03

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:4			reserved
3	R/W	0x0	omclk2ref hardware latch enble: 1= enable ; 0= disable

2	R/W	0x0	Ref2omclk hardware latch enable: 1= enable; 0= disable
1	R/W	0x0	Ref2imclk hardware latch enable: 1= enable; 0= disable
0	R/W	0x0	Imclk2ref hardware latch enable: 1= enable; 0= disable

**AUD\_LOCK\_REFCLK\_SRC 0X04**

Bit(s)	R/W	Default	Description
31:2			reserved
1:0	R/W	0x0	Ref clk source sel: 0= pclk; 1=oscinclk; 2,3,reserved

**AUD\_LOCK\_REFCLK\_LAT\_INT 0X05**

Bit(s)	R/W	Default	Description
31:0			U32 number of reference clock cycles to latch the imclk and omclk

**AUD\_LOCK\_IMCLK\_LAT\_INT 0X06**

Bit(s)	R/W	Default	Description
31:0			U32 number of imclk clock cycles to latch the reference clock

**AUD\_LOCK\_OMCLK\_LAT\_INT 0X07**

Bit(s)	R/W	Default	Description
31:0			U32 number of omclk clock cycles to latch the reference clock

**AUD\_LOCK\_REFCLK\_DS\_INT 0X08**

Bit(s)	R/W	Default	Description
31:10			reserved
9:0	R/W	0x0	U10 downsample step of reference clock for the counter48ds to be measured, module = x+1

**AUD\_LOCK\_IMCLK\_DS\_INT 0X09**

Bit(s)	R/W	Default	Description
31:10			reserved
9:0	R/W	0x0	U10 downsample step of imclk for the counter48ds to be measured, module = x+1

**AUD\_LOCK\_OMCLK\_DS\_INT 0X0a**

Bit(s)	R/W	Default	Description
31:10			reserved

9:0	R/W	0x0	U10 downsample step of omclk for the counter48ds to be measured, module = x+1
-----	-----	-----	---

**AUD\_LOCK\_INT\_CLR 0X0b**

Bit(s)	R/W	Default	Description
31:2			reserved
1	R/W	0x0	It is used to generate pulse to clear the interrupt status
0	R/W	0x0	It is used to generate pulse to clear the interrupt

**AUD\_LOCK\_GCLK\_CTRL 0X0c**

Bit(s)	R/W	Default	Description
31:4			reserved
3:2	R/W	0x0	It is used to gate the module clock
1	R/W	0x0	It is used to gate the register clock
0			reserved

**AUD\_LOCK\_INT\_CTRL 0X0d**

Bit(s)	R/W	Default	Description
31:4			reserved
3	R/W	0x0	It is used to mask interrupt for omclk_state
2	R/W	0x0	It is used to mask interrupt for imclk_state
1	R/W	0x0	It is used to mask interrupt for refclk_state1
0	R/W	0x0	It is used to mask interrupt for refclk_state0

**RO\_REF2IMCLK\_CNT\_L 0X10**

Bit(s)	R/W	Default	Description
31:0	R	0x0	U48 latched imclk counter48ds of each reg_refclk_latch_interval; Will start from 0 reaching $2^{48}$

**RO\_REF2IMCLK\_CNT\_H 0X11**

Bit(s)	R/W	Default	Description
31:16			reserved
15:0	R	0x0	U48 latched imclk counter48ds of each reg_refclk_latch_interval; Will start from 0 reaching $2^{48}$

**RO\_REF2OMCLK\_CNT\_L 0X12**

Bit(s)	R/W	Default	Description
--------	-----	---------	-------------

31:0	R	0x0	U48 latched omclk counter48ds of each reg_refclk_latch_interval; Will start from 0 reaching $2^{48}$
------	---	-----	---

**RO\_REF2OMCLK\_CNT\_H 0X13**

Bit(s)	R/W	Default	Description
31:16			reserved
15:0	R	0x0	U48 latched omclk counter48ds of each reg_refclk_latch_interval; Will start from 0 reaching $2^{48}$

**RO\_IMCLK2REF\_CNT\_L 0X14**

Bit(s)	R/W	Default	Description
31:0	R	0x0	U48 latched reference clock counter48ds of each reg_imclk_latch_interval; Will start from 0 reaching $2^{48}$

**RO\_IMCLK2REF\_CNT\_H 0X15**

Bit(s)	R/W	Default	Description
31:16			reserved
15:0	R	0x0	U48 latched reference clock counter48ds of each reg_imclk_latch_interval; Will start from 0 reaching $2^{48}$

**RO\_OMCLK2REF\_CNT\_L 0X16**

Bit(s)	R/W	Default	Description
31:0	R	0x0	U48 latched reference clock counter48ds of each reg_omclk_latch_interval; Will start from 0 reaching $2^{48}$

**RO\_OMCLK2REF\_CNT\_H 0X17**

Bit(s)	R/W	Default	Description
31:16			reserved
15:0	R	0x0	U48 latched reference clock counter48ds of each reg_omclk_latch_interval; Will start from 0 reaching $2^{48}$

**RO\_REFCLK\_PKG\_CNT 0X18**

Bit(s)	R/W	Default	Description
31:16	R	0x0	U16,number of reference clk latch interval period conter for imclk latch
15:0	R	0x0	U16,number of reference clk latch interval period conter for imclk latch

**RO\_IMCLK\_PKG\_CNT 0X19**

Bit(s)	R/W	Default	Description
--------	-----	---------	-------------

31:16			reserved
15:0	R	0x0	U16,number of imclk latch interval period counter

**RO\_OMCLK\_PKG\_CNT 0X1a**

Bit(s)	R/W	Default	Description
31:16			reserved
15:0	R	0x0	U16,number of omclk latch interval period counter

**RO\_AUD\_LOCK\_INT\_STATUS 0X1b**

Bit(s)	R/W	Default	Description
31:4			reserved
3	R	0x0	It is used to report interrupt status for omclk_state
2	R	0x0	It is used to report interrupt status for imclk_state
1	R	0x0	It is used to report interrupt status for refclk_state1
0	R	0x0	It is used to report interrupt status for refclk_state0

## 12. AIFIFO

### 12.1 Register Description

Base address: 0xffd05000

#### AIU\_AIFIFO\_CTRL 0x00

Bit(s)	R/W	Default	Description
13	R/W	0	Aififo request to dcu status
12	R/W	0	Dcu select status
11:5	R/W	0	Aififo word counter number
4:0	R/W	0	How many bits left in the first pop register

#### AIU\_AIFIFO\_STATUS 0x01

Bit(s)	R/W	Default	Description
4:0	R	0x0	How many Bits left in the first pop register

#### AIU\_AIFIFO\_GBIT 0x02

Bit(s)	R/W	Default	Description
15:0	R	0x0	The gb data

#### AIU\_AIFIFO\_CLB 0x03

Bit(s)	R/W	Default	Description
15:0	R	0x0	The gb data

#### AIU\_MEM\_AIFIFO\_START\_PTR 0x04

Bit(s)	R/W	Default	Description
31:0	RW	0x0	The start address from DDR

#### AIU\_MEM\_AIFIFO\_CURR\_PTR 0x05

Bit(s)	R/W	Default	Description
31:0	R	0x0	The current address from DDR

#### AIU\_MEM\_AIFIFO\_END\_PTR 0x06

Bit(s)	R/W	Default	Description
31:0	RW	0x0	The end address from DDR

**AIU\_MEM\_AIFIFO\_BYTES\_AVAIL 0x07**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:11	R/W	0	Unused.
10	R/W	0	Set this bit to 1 to enable filling of the FIFO controlled by the buffer level control. If this bit is 0, then use bit[1] to control the enabling of filling
9	R/W	0	This bit is set when data can be popped
8	R/W	0	This bit will be high when we're fetching data from the DDR memory To reset this module, set cntl_enable = 0, and then wait for busy = 0. After that you can pulse cntl_init to start over
7	R/W	0	Just in case endian. last minute byte swap of the data out of the FIFO to getbit
6	R/W	0	Unused.
5:3	R/W	0	
2	R/W	0	Set to 1 to enable reading the DDR memory FIFO and filling the pipeline to get-bit Set cntl_empty_en = cntl_fill_en = 0 when pulsing cntl_init
1	R/W	0	Set to 1 to enable reading data from DDR memory
0	R/W	0	After setting the read pointers, sizes, channel masks and read masks, set this bit to 1 and then to 0 NOTE: You don't need to pulse cntl_init if only the start address is being changed

**AIU\_MEM\_AIFIFO\_CONTROL 0x08**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:11		0x0	Unused
10	RW	0x0	Use_level Set This bit to 1 to enable filling of the FIFO controlled by the buffer level control. If This bit is 0, then use Bit[1] to control the enabling of filling
9	RW	0x0	Data Ready. This bit is set when data can be popped
8	RW	0x0	Fill busy This bit will be high when we're fetching data from the DDR memory
7	RW	0x0	Cntl_endian_jic Just in case endian. Last minute byte swap of the data out of the FIFO to get bit
6	RW	0x0	Unused
5: 3	RW	0x0	Endian
2	RW	0x0	Cntl_empty_en Set to 1 to enable reading the DDR memory FIFO and filling the pipeline to get-bit
1	RW	0x0	Cntl_fill_en Set to 1 to enable reading data from DDR memory
0	RW	0x0	Cntl_init

**AIU\_MEM\_AIFIFO\_MAN\_WP 0x09**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0x0	Manual write ptr.

**AIU\_MEM\_AIFIFO\_MAN\_RP 0x0a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0x0	Manual read ptr.

**AIU\_MEM\_AIFIFO\_LEVEL 0x0b**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
1	R/W	0	Set to 1 for manual write pointer mode
0	R/W	0	Set high then low after everything has been initialized

**AIU\_MEM\_AIFIFO\_BUF\_CNTL 0x0c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
1	RW	0x0	manual mode Set to 1 for manual write pointer mode
0	RW	0x0	Init Set high then low after everything has been initialized

**AIU\_MEM\_AIFIFO\_BUF\_WRAP\_COUNT 0x0d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:24	R/W	0	A_burst_num
21:16	R/W	0	A_id
15:0	R/W	0	level_hold

**AIU\_MEM\_AIFIFO\_MEM\_CTL 0x0f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16	R/W	0	drop_bytes
15:14	R/W	0	drop_status (Read-Only)
13:12	R/W	0	sync_match_position (Read-Only)
11:6	R/W	0	reserved
5:4	R/W	0	TIME_STAMP_NUMBER, 0-32bits, 1-64bits, 2-96bits, 3-128bits
3	R/W	0	stamp_soft_reset
2	R/W	0	TIME_STAMP_length_enable
1	R/W	0	TIME_STAMP_sync64_enable
0	R/W	0	TIME_STAMP_enable

**AIFIFO\_TIME\_STAMP\_CNTL 0x10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	TIME_STAMP_SYNC_CODE_0

**AIFIFO\_TIME\_STAMP\_SYNC\_0 0x11**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	TIME_STAMP_SYNC_CODE_1

**AIFIFO\_TIME\_STAMP\_SYNC\_1 0x12**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	TIME_STAMP_0

**AIFIFO\_TIME\_STAMP\_0 0x13**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	TIME_STAMP_1

**AIFIFO\_TIME\_STAMP\_1 0x14**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	TIME_STAMP_2

**AIFIFO\_TIME\_STAMP\_2 0x15**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	TIME_STAMP_3

**AIFIFO\_TIME\_STAMP\_3 0x16**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	TIME_STAMP_LENGTH

**AIFIFO\_TIME\_STAMP\_LENGTH 0x17**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0x0	TIME_STAMP_LENGTH

## 13. Memory Interface

This part describes A311D's memory interfaces from the following aspects:

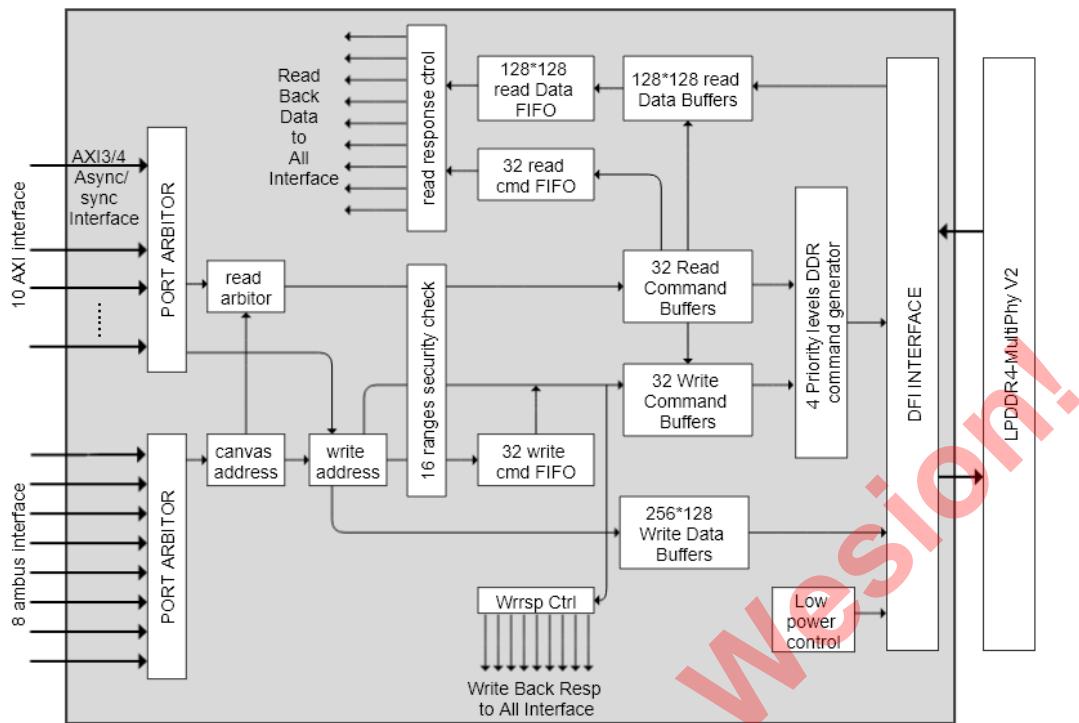

- DDR
- NAND
- EMMC/SDIO/SD
- SPICC
- SPIFC

### 13.1 DDR

#### 13.1.1 Overview

consists of the 2 parts: DDR memory controller (DMC) and DDR PHY controller. The main features of this module are listed below:

- Support DDR3/4 SDRAM, LPDDR3, LPDDR4 SDRAM
- Support 32bits and 16bits data mode.
- Unbalanced 16bits DDR3/4 SDRAM size in 32 bits data bus mode.
- Each DDR command buffer contains 64bytes data.
- 32 write command buffer and 32 read command buffer for DDR command generation.
- READ command reordering regardless ID.
- Write command reordering regardless IDs.
- Write and read data coherence.
- Optimized DDR command reordering based on:
  - Priority
  - Rank
  - Bank
  - Bank group interleaving(DDR4)
  - Read/write
- 4 level priority control to reduce the latency for the urgent request.
- Unblocking urgent control through Asynchronous FIFO and pipelines.
- Additional 128 depth write data FIFO to balance DMC and AXI master write throughputs.
- Additional 128\*128 read data FIFO to balance DMC and AXI master read throughputs.
- Per Port Per ID Security Control through the all security ranges.
- Up to 16 security range can be defined.
- Support up to 16 AXI3/4 and 8 AMBUS(Amlogic) interfaces.
- Optimized AMBUS to support 0~3 burst to improve DDR efficiency and reduce
- Low power control with LPDDR4 Multi-PHY V2.
  - Adding auto Self-Refresh mode for super low bandwidth application.
  - Auto power down mode for most of application.
  - Hardware Fast Frequency change less than 10uS.

**Figure 13-1 Diagram of DDR Interface**

### 13.1.2 Register Description

DMC Register spec.

DMC unsecure register. Base address 0xFF638000. Each register takes 4 byte address.

Each register's final address = 0xFF638000 + offset \* 4.

#### **AM\_DDR\_PLL\_CNTL0 0x0000**

Bit(s)	R/W	Default	Description
29			dpll_reset.
28			dpll_en.
27:26			dpll_clk_en
20:19			od1
18:16			od
14:10			dpll_ref_div_n
8:0			dpll_int_num

#### **AM\_DDR\_PLL\_CNTL1 0x0001**

Bit(s)	R/W	Default	Description
18:0			ddr_dpll_frac

**AM\_DDR\_PLL\_CNTL2 0x0002**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
22:20			fref_sel
17:16			os_ssc
15:12			ssc_str_m
8			ssc_en
7:4			ssc_dep_sel
1:0			dpll ss_mode

**AM\_DDR\_PLL\_CNTL3 0x0003**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			afc bypass
30			afc clk sel
29			code new
28			dco_m_en
27			dco_sdm_en
26			div2
25			div mode
24			fast_lock mode
23			fb_pre_div
22			filter_mode
21			fix_en
20			freq_shift_en
19			load
18			load_en
17			lock_f
16			pulse_width_en
15			sdmnc_en
14			sdmnc_mode
13			sdmnc_range
12			tdc_en

Bit(s)	R/W	Default	Description
11			tdc_mode_sel
10			wait_en

**AM\_DDR\_PLL\_CNTL4 0x0004**

Bit(s)	R/W	Default	Description
1:0			pfd_gain
7:4			filter_pvt1
11:8			filter pvt2
13:12			acq_gain
18:16			lambda0
22:20			lambda1
26:24			rou
30:28			alpha

**AM\_DDR\_PLL\_CNTL5 0x0005**

Bit(s)	R/W	Default	Description
15:0			reve
21:16			lm_s
27:24			lm_w
30:28			adj_vco_ldo

**AM\_DDR\_PLL\_CNTL6 0x0006**

Bit(s)	R/W	Default	Description
15:0			reve
21:16			lm_s
27:24			lm_w
30:28			adj_vco_ldo

**AM\_DDR\_PLL\_STS 0x0007**

Bit(s)	R/W	Default	Description
31			DDR_PLL_LOCK
30:19			not used
18			DDR_AFC_DONE

17			DDR_PLL_LOCK
16:7			DDR_DPLL_OUT_RSV
6:0			DDR_SDMNC_MONITOR

**DDR\_CLK\_CNTL 0x0008**

Bit(s)	R/W	Default	Description
31			ddr_pll_clk enable. enable the clock from DDR_PLL to clock generateion.
30			ddr_pll_prod_test_en. enable the clock to clock/32 which to clock frequency measurement and production test pin.
29			not used.
28			clock generation logic soft reset. 0 = reset.
27			phy_4xclk phase inverter
26			pll_freq divide/2. 1: use pll div/2 clock as the n_clk. 0: use pll clock as n_clk. this setting is used for the DDR PHY PLL fast lock mode.
2			enable dmc_clk.
1			enable LPDDR4-PHY DfiClk.
0			enable LPDDR4-PHY DfiCtlClk.

**DDR\_PHY\_CTRL 0x0009**

Bit(s)	R/W	Default	Description
4			DDR PHY PwrOkIn pin.
1			DDR PHY APB soft reset_n.
0			phy_reset_n.

**AM\_DDR\_PLL\_FREQ1\_OD 0x000c**

Bit(s)	R/W	Default	Description
8			currunt FREQ selection. it can forced to change to select which freqency to select, or it can auto changed by FREQ change hardware.
5:4			OD1.
2:0			OD.

The following registers' base address is 0xff638000. Each register takes 4 byte address.

Each register's final address = 0xff638000 + offset \* 4.

**DMC\_REQ\_CTRL 0x0000**

Bit(s)	R/W	Default	Description
23			enable dmc request of ambus chan 7. Reserved for GE2D interface. Async interface.

22			enable dmc request of ambus chan 6. DOS HCODEC interface Sync interface.
21			enable dmc request of ambus chan 5. DOS VDEC interface Sync interface.
20			enable dmc request of ambus chan 4. VPU write interface 1 Sync interface.
19			enable dmc request of ambus chan 3. VPU write interface 0 Sync interface.
18			enable dmc request of ambus chan 2. VPU read interface 2. Sync interface.
17			enable dmc request of ambus chan 1. VPU read interface 1. Sync interface.
16			enable dmc request of ambus chan 0. VPU read interface 0. Sync interface.
9			enable dmc request of axibus chan 9. wave async interface.
8			enable dmc request of axibus chan 8 hevc_b async interface.
7			enable dmc request of axibus chan 7. DEVICE. Async interface.
6			enable dmc request of axibus chan 6. USB Async interface.
5			enable dmc request of axibus chan 5. reserved for dmc_test.
4			enable dmc request of axibus chan 4. hevc front Async interface.
3			enable dmc request of axibus chan 3. HDCP/HDMI Async interface.
2			enable dmc request of axibus chan 2. pcie async
1			enable dmc request of axibus chan 1. Dvalin . async interface.
0			enable dmc request of axibus chan 0. CPU/A53 async interface.

**DMC\_SOFT\_RST 0x0001**

Bit(s)	R/W	Default	Description
31:24			Reserved.
23:16			8 AMBUS input interface n_clk domain reset_n signal. 0 : reset. 1: normal working mode.
15:0			16 AXI BUS input interfaces n_clk domain reset_n signal. 0: reset. 1: normal working mode. each bit for one interface.

**DMC\_SOFT\_RST1 0x0002**

Bit(s)	R/W	Default	Description
31:24			Not used.
23.16			8 am bus interfaces master clock domain reset_n signal. 0 : reset : 1 normal working mode.
15:0.			16 AXI bus interfaces master clock domain reset_n signal. 0 : reset : 1 normal working mode.

**DMC\_SOFT\_RST2 0x0003**

Bit(s)	R/W	Default	Description
31~11			Reserved.
10			DMC DFI cmd soft reset_n
9			DMC DFI MISC soft reset_n
8			DMC DFI data soft reset_n
7			DMC DFI dcu soft reset_n
6			DMC siu soft reset_n
5			DMC test soft reset_n. 0 : reset. 1 : normal working mode.
4			DMC low power control module soft reset_n. 0 : reset. 1 : normal working mode.
3			DMC QOS monitor module soft reset_n. 0 : reset. 1 : normal working mode.
2			DMC register module soft reset_n. 0 : reset. 1 : normal working mode.
1			DMC canvas transfer module soft reset_n. 0 : reset. 1 : normal working mode.
0			DMC command buffers and command generation modules soft reset. 0 = reset. 1:

**DMC\_RST\_STS1 0x0004**

Bit(s)	R/W	Default	Description
31:24			Not used.
23:0			Read only. The DMC_SOFT_RST1 signal in n_clk domain. When one of the 2 clocks is too slow or too fast, we can read this register to make sure another clock domain reset is done.

**DMC\_VERSION 0x0005**

DMC version number.

**DMC\_RAM\_PD 0x0006**

Bit(s)	R/W	Default	Description
5:4			DDR channel 1 READ/WRITE data path SRAMS in power down control. 2'b11: power down. 2'b00: working mode.
3:2			DDR channel 0 READ/WRITE data path SRAMS in power down control. 2'b11: power down. 2'b00: working mode.
1:0			CANVAS LUT memories in power down mode control. 2'b11: power down. 2'b00: working mode.

**DC\_CAV\_LUT\_DATAL 0x0012**

low 32 bits of canvas data which need to be configured to canvas memory.

**DC\_CAV\_LUT\_DATAH 0x0013**

Bit(s)	R/W	Default	Description
60:58			Canvas block mode. 2: 64x32, 1: 32x32; 0: linear mode.
57:56			canvas Y direction wrap control. 1: wrap back in y. 0: not wrap back.
55			canvas X direction wrap control. 1: wrap back in X. 0: not wrap back.
54			canvas Hight.
53:41			canvas Width, unit: 8bytes. must in 32bytes boundary. that means last 2 bits must be 0.
40:29			cavnas start address. unit. 8 bytes. must be in 32bytes boundary. that means last 2bits must be 0.
28:0			Canvas block mode. 2 : 64x32, 1: 32x32; 0 : linear mode.

**DC\_CAV\_LUT\_ADDR 0x0014**

Bit(s)	R/W	Default	Description
9:8			Write 9:8 2'b10. the canvas data will saved in canvas memory with addres 7:0.
7:0			256 canvas Look up table address.

**DC\_CAV\_LUT\_RDATAH 0x0015**

CBUS low 32bytes canvas read back data from LUT.

**DC\_CAV\_LUT\_RDATAH 0x0016**

CBUS low 32bytes canvas read back data from LUT.

**DC\_CAV\_BLK\_CTRL0 0x0018**

Bit(s)	R/W	Default	Description
31:0			blkmode. 1 : 32x32. 0 : others.

**DC\_CAV\_BLK\_CTRL1 0x0019**

Bit(s)	R/W	Default	Description
63:32			blkmode. 1 : 32x32. 0 : others.

**DC\_CAV\_BLK\_CTRL2 0x001a**

Bit(s)	R/W	Default	Description
95:64			blkmode. 1 : 32x32. 0 : others.

**DC\_CAV\_BLK\_CTRL3 0x001b**

Bit(s)	R/W	Default	Description
127:96			blkmode. 1 : 32x32. 0 : others.

**DC\_CAV\_BLK\_CTRL4 0x001c**

Bit(s)	R/W	Default	Description
159:128			blkmode. 1 : 32x32. 0 : others.

**DC\_CAV\_BLK\_CTRL5 0x001d**

Bit(s)	R/W	Default	Description
191:160			blkmode. 1 : 32x32. 0 : others.

**DC\_CAV\_BLK\_CTRL6 0x001e**

Bit(s)	R/W	Default	Description
223:192			blkmode. 1 : 32x32. 0 : others.

**DC\_CAV\_BLK\_CTRL7 0x001f**

Bit(s)	R/W	Default	Description
255:224			blkmode. 1 : 32x32. 0 : others.

**DMC\_MON\_CTRL0 0x0020**

Bit(s)	R/W	Default	Description
31			qos_mon_en. write 1 to trigger the enable. polling this bit 0, means finished. or use interrupt to check finish.
30			qos_mon interrupt clear. clear the qos monitor result. read 1 = qos mon finish interrupt.
3			qos monitor 3 enable.
2			qos monitor 2 enable.
1			qos monitor 1 enable.
0			qos monitor 0 enable.

**DMC\_MON\_CTRL1 0x0021**

Bit(s)	R/W	Default	Description
23:0			qos monitor 0 channel select. 8 ambus port and 16 AXI port selection. 1 bit for one port.

**DMC\_MON\_CTRL2 0x0022**

Bit(s)	R/W	Default	Description
15:0			port select for the selected channel.

**DMC\_MON\_CTRL3 0x0023**

Bit(s)	R/W	Default	Description

23:0			qos monitor 0 channel select. 8 ambus port and 16 AXI port selection. 1 bit for one port.
------	--	--	---

**DMC\_MON\_CTRL4 0x0024**

Bit(s)	R/W	Default	Description
15:0			port select for the selected channel.

**DMC\_MON\_CTRL5 0x0025**

Bit(s)	R/W	Default	Description
23:0			qos monitor 0 channel select. 8 ambus port and 16 AXI port selection. 1 bit for one port.

**DMC\_MON\_CTRL6 0x0026**

Bit(s)	R/W	Default	Description
15:0			port select for the selected channel.

**DMC\_MON\_CTRL7 0x0027**

Bit(s)	R/W	Default	Description
23:0			port select for the selected channel.

**DMC\_MON\_CTRL8 0x0028**

Bit(s)	R/W	Default	Description
15:0			port select for the selected channel.

**DMC\_MON\_ALL\_REQ\_CNT 0x0029**

At the test period, the whole MMC request time.

**DMC\_MON\_ALL\_GRANT\_CNT 0x002a**

At the test period, the whole MMC granted data cycles. 64bits unit.

**DMC\_MON\_ONE\_GRANT\_CNT 0x002b**

At the test period, the granted data cycles for the selected channel and ports.

**DMC\_MON\_SEC\_GRANT\_CNT 0x002c**

At the test period, the granted data cycles for the selected channel and ports.

**DMC\_MON\_THD\_GRANT\_CNT 0x002d**

At the test period, the granted data cycles for the selected channel and ports.

**DMC\_MON\_FOR\_GRANT\_CNT 0x002e**

At the test period, the granted data cycles for the selected channel and ports.

**DMC\_MON\_TIMER 0x002f**

Timer for the monitor period.

**DMC\_CLKG\_CTRL0 0x0030**

Bit(s)	R/W	Default	Description
23:16			Enable the 8 ambus interfaces both main and n_clk auto clock gating function. each 1 bit for one interface.
15:0			Enable the 16 axi interfaces both main and n_clk auto clock gating function. each 1 bit for one interface.

**DMC\_CLKG\_CTRL1 0x0031**

Bit(s)	R/W	Default	Description
23:16			Force to disable the 8 ambus interfaces both main and n_clk. each 1 bit for one interface.
15:0			Force to disable the 16 axi interfaces both main and n_clk. each 1 bit for one interface.

**DMC\_CLKG\_CTRL2 0x0032**

Bit(s)	R/W	Default	Description
7			Force to disalbe the clock of write rsp generation.
6			Force to disalbe the clock of read rsp generation.
5			Force to disalbe the clock of command filter.
4			Force to disalbe the clock of write reorder buffer.
3			Force to disalbe the clock of write data buffer.
2			Force to disalbe the clock of read reorder buffer.
1			Force to disalbe the clock of read canvas.
0			Force to disalbe the clock of write canvas.

**DMC\_CLKG\_CTRL3 0x0033**

Bit(s)	R/W	Default	Description
7			Enalbe auto clock gating for write rsp generation.
6			Enalbe auto clock gating for read rsp generation.
5			Enalbe auto clock gating for ddr0 command filter.
4			Enalbe auto clock gating for ddr0 write reorder buffer.
3			Enalbe auto clock gating for ddr0 write data buffer.
2			Enalbe auto clock gating for ddr0 read reorder buffer.
1			Enalbe auto clock gating for read canvas.
0			Enalbe auto clock gating for write canvas.

**DMC\_CHAN\_STS 0x0036**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	RO		Not used.
27	RO		always 1
26	RO		ddr0 write data buffer idle. 1 : idle 0: busy.
25	RO		always 1.
24	RO		ddr0 wbuf idle. 1 : idle 0: busy.
23:16	RO		ambus channel idle. 1 : idle 0: busy.
15:0.	RO		axibus channel idle. 1 : idle 0: busy.

**DMC\_2ARB\_CTRL 0x0038**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
32:24			Not used.
22.			always 1
21:12			ddr0 write data buffer idle. 1 : idle 0: busy.
11:6.			always 1.
5:0.			ddr0 wbuf idle. 1 : idle 0: busy.

**DMC\_CMD\_FILTER\_CTRL1 0x0040**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30			1 : use DDR4 special filter.

**DMC\_CMD\_FILTER\_CTRL2 0x0041**

Not used.

**DMC\_CMD\_FILTER\_CTRL3 0x0042**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31.			force wbuf empty.
30:26			wbuf high level number
25:21			wbuf mid level number
20:16			wbuf low level number
14:10			rbuf high level number
9:5			rbuf middle level number
4:0			rbuf low level number

**DMC\_CMD\_FILTER\_CTRL4 0x0043**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:25			tITW.long
24:20			tITW. short
19:12			tAP auto precharge the bank not used if idle that long time.
11:6			write to read accesses if there write hit request.
5:0			read to write accesses if there write hit request.

**DMC\_CMD\_FILTER\_CTRL5 0x0044**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Once ddr data bus switch to read, the maximum read command number to give up the bus when there's write request pending for write buffer.
23:16			Once ddr data bus switch to write, the maximum write command number to give up the bus when there's read request pending too long.
15:8.			Once ddr data bus switch to read, the minimum read command number to transfer back to write stage if there's still pending read request.
7:0.			Once ddr data bus switch to write, the minimum write command number to transfer back to read stage if there's still pending write request.

**DMC\_CMD\_BUFFER\_CTRL 0x0045**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26			Total write buffer number. Default 32.
25:20			Total read buffer number. Default 32.
19:8			Reserved
7:0			aw_pending_inc_num. increase write urgent level 1 when write command waiting to in write buffer that long.

**DMC\_CMD\_BUFFER\_CTRL1 0x0046**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26			Read buffer number in non-urgent request.
25:20			Read buffer bank miss watch dog threshold.
19:8			Read buffer urgent level 3 counter inc weight.
7:0			Read buffer urgent level 2 counter inc weight.
3:0			Read buffer urgent level 2 counter inc weight.

**DMC\_CMD\_FILTER\_CTRL6 0x0047**

Bit(s)	R/W	Default	Description
31:24			write urgent 3 request pending hold num.
23:16			write urgent 2 request pending hold num.
15:8			write urgent 1 request pending hold num.
7:0			write urgent 0 request pending hold num.

**DMC\_RDDBUF\_CTRL 0x0048**

Not used.

**DMC\_CMD\_FILTER\_CTRL7 0x0049**

Bit(s)	R/W	Default	Description
15:8			Write to read waiting cycles if there write hit request.
7:0			Read to write waiting cycles if there write hit request.

**DMC\_AM0\_CHAN\_CTRL 0x0060**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non-urgent request.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AM0\_HOLD\_CTRL 0x0061**

Bit(s)	R/W	Default	Description
15:8			Read hold num. Max outstanding request number.
7:0			Read hold release num. If the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AM0\_CHAN\_CTRL1 0x0062**

Bit(s)	R/W	Default	Description
31			Side band signal used as block other request.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
30			Side band urgent increase enable.
29			Side band urgent decrease urgent enable.
23:16			When bit 31 enabled, block the ambus related bits read request.
15:0			When bit 31 enabled, block the axi bus related bits read request.

**DMC\_AM0\_CHAN\_CTRL2      0x0063**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Not used.
23:16			When side band signal used as block other request, and side bank signal is high, block the ambus related bits write request.
15:0			When side band signal used as block other request, and side bank signal is high, block the axi bus related bits write request.

**DMC\_AM1\_CHAN\_CTRL      0x0064**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non urgent request.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AM1\_HOLD\_CTRL      0x0065**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15:8			Read hold num. Max outstanding request number.
7:0			Read hold release num. If the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AM1\_CHAN\_CTRL1      0x0066**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:			Side band signal used as block other request.

30 :			Side band urgent increase enable.
29 :			Side band urgent decrease urgent enable.
23:16			When bit 31 enabled, block the ambus related bits read request.
15:0			When bit 31 enabled, block the axi bus related bits read request.

**DMC\_AM1\_CHAN\_CTRL2      0x0067**

Bit(s)	R/W	Default	Description
31:24			Not used.
23:16			When side band signal used as block other request, and side bank signal is high, block the ambus related bits write request.
15:0			When side band signal used as block other request, and side bank signal is high, block the axi bus related bits write request.

**DMC\_AM2\_CHAN\_CTRL      0x0068**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non urgent request.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AM2\_HOLD\_CTRL      0x0069**

Bit(s)	R/W	Default	Description
15:8			Read hold num. Max outstanding request number.
7:0			Read hold release num. If the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AM2\_CHAN\_CTRL1      0x006a**

Bit(s)	R/W	Default	Description
31:			Side band signal used as block other request.
30 :			Side band urgent increase enable.
29 :			Side band urgent decrease urgent enable.

23:16			When bit 31 enabled, block the ambus related bits read request.
15:0			When bit 31 enabled, block the axi bus related bits read request.

**DMC\_AM2\_CHAN\_CTRL1      0x006b**

Bit(s)	R/W	Default	Description
31:24			Not used.
23:16			When side band signal used as block other request, and side bank signal is high, block the ambus related bits write request.
15:0			When side band signal used as block other request, and side bank signal is high, block the axi bus related bits write request.

**DMC\_AM3\_CHAN\_CTRL      0x006c**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non urgent request.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AM3\_HOLD\_CTRL      0x006d**

Bit(s)	R/W	Default	Description
31:24			Write hold num. Max outstanding request number.
23:16			Write hold release num. If the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AM3\_CHAN\_CTRL1      0x006e**

Bit(s)	R/W	Default	Description
31			Side band signal used as block other request.
30			Side band urgent increase enable.
29			Side band urgent decrease urgent enable.
23:16			When bit 31 enabled, block the ambus related bits read request.
15:0			When bit 31 enabled, block the axi bus related bits read request.

**DMC\_AM3\_CHAN\_CTRL2      0x006f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Not used.
23:16			When side band signal used as block other request, and side bank signal is high, block the ambus related bits write request.
15:0			When side band signal used as block other request, and side bank signal is high, block the axi bus related bits write request.

**DMC\_AM4\_CHAN\_CTRL      0x0070**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non urgent request.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AM4\_HOLD\_CTRL      0x0071**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Write hold num. Max outstanding request number.
23:16			Write hold release num. If the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AM4\_CHAN\_CTRL1      0x0072**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:			Side band signal used as block other request.
30 :			Side band urgent increase enable.
29 :			Side band urgent decrease urgent enable.
23:16			When bit 31 enabled, block the ambus related bits read request.
15:0			When bit 31 enabled, block the axi bus related bits read request.

**DMC\_AM4\_CHAN\_CTRL2      0x0073**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31:24			Not used.
23:16			When bit 31 enabled, block the ambus related bits write request.
15:0			When bit 31 enabled, block the axi bus related bits write request.

**DMC\_AM5\_CHAN\_CTRL 0x0074**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non urgent request.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AM5\_HOLD\_CTRL 0x0075**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AM6\_CHAN\_CTRL 0x0078**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non urgent request.

3:0			Canvas arbiter arbiter weight
-----	--	--	-------------------------------

**DMC\_AM6\_HOLD\_CTRL 0x0079**

Bit(s)	R/W	Default	Description
31:24			Enable to incr 2 urgent levels if the pending cycles is doubled.
23:16			Enable to incr 3 urgent levels.
15:8			Write request pending cycle number to inc urgent level if not granted.
7:0			Force this channel all request to be super urgent request.

**DMC\_AM7\_CHAN\_CTRL 0x007c**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non urgent request.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AM7\_HOLD\_CTRL 0x007d**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI0\_CHAN\_CTRL 0x0080**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.

19			Axi0 default urgent control : 1 use AWUGT/ARUGT pins in the port. 0 : use bit[15:14] of this register.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non urgent request.
15:14			Axi0 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Arbiter weight

**DMC\_AXI0\_HOLD\_CTRL 0x0081**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI0\_CHAN\_CTRL1 0x0082**

Bit(s)	R/W	Default	Description
19:16			FIQ status
15:12			IRQ status.
11			ARM FIQ controlled super urgent enable.
10			ARM FIQ controlled urgent enable.
9			ARM IRQ controlled super urgent enable.
8			ARM IRQ controlled urgent enable.
7			IRQ/FIQ controll enable.
6:5			Not used.
4			Enable AXI0 auto urgent enable. When there's no other request, treat the AXI0 as super urgent request. Other wise, use the bit3:0 to set the urgent.
3:2			A9 urgent if there's VIU request.
1:0			A9 urgent if there's request other than VIU

**DMC\_AXI1\_CHAN\_CTRL 0x0084**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19.			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI1\_HOLD\_CTRL 0x0085**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI2\_CHAN\_CTRL 0x0088**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19.			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non-urgent request.

15:14			Axi1 default urgent level.
13:4.			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI2\_HOLD\_CTRL 0x0089**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI3\_CHAN\_CTRL 0x008c**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19.			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI3\_HOLD\_CTRL 0x008d**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.

7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
-----	--	--	--

**DMC\_AXI4\_CHAN\_CTRL 0x0090**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19.			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18.			Force this channel all request to be super urgent request.
17.			Force this channel all request to be urgent request.
16.			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI4\_HOLD\_CTRL 0x0091**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI5\_CHAN\_CTRL 0x0094**

Not used.

**DMC\_AXI5\_HOLD\_CTRL 0x0095**

Not used.

**DMC\_AXI6\_CHAN\_CTRL 0x0096**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:20			Write request pending cycle number to inc urgent level if not granted.
19			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI6\_HOLD\_CTRL 0x0097**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI7\_CHAN\_CTRL 0x009c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI7\_HOLD\_CTRL 0x009d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI8\_CHAN\_CTRL 0x00a0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI8\_HOLD\_CTRL 0x00a1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI9\_CHAN\_CTRL 0x00a4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI9\_HOLD\_CTRL 0x00a5**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI10\_CHAN\_CTRL 0x00a8**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.

13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI10\_HOLD\_CTRL      0x00a9**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

**DMC\_AXI11\_CHAN\_CTRL      0x00ac**

Bit(s)	R/W	Default	Description
31			Enable to incr 2 urgent levels if the pending cycles is doubled.
30			Enable to incr 3 urgent levels.
29:20			Write request pending cycle number to inc urgent level if not granted.
19			Axi0 default urgent control: 1 use AWUGT/ARUGT pins in the port. 0: use bit[15:14] of this register.
18			Force this channel all request to be super urgent request.
17			Force this channel all request to be urgent request.
16			Force this channel all request to be non-urgent request.
15:14			Axi1 default urgent level.
13:4			Read request pending cycle number to inc urgent level if not granted.
3:0			Canvas arbiter arbiter weight

**DMC\_AXI11\_HOLD\_CTRL      0x00ad**

Bit(s)	R/W	Default	Description
31:24			Write hold num. max outstanding request number.
23:16			Write hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.
15:8			Read hold num. max outstanding request number.
7:0			Read hold release num. if the outstanding request == hold num, then hold this request unless the outstanding request number below the hold release number, then continue to request.

The following registers' base address is 0xff639000. Each register takes 4 byte address.

Each register's final address = 0xff639000 + offset \* 4.

**DMC\_SEC\_RANGE\_CTRL 0x0000**

Bit(s)	R/W	Default	Description
31:16			16 range security level. each
15:0			16 range enable. each bit for one range to identify the range is enabled or not.

**DMC\_SEC\_RANGE0\_CTRL 0x0001**

Bit(s)	R/W	Default	Description
31:16			range 0 end address higher 16bits.
15:0			range 0 start address higher 16bits.

**DMC\_SEC\_RANGE1\_CTRL 0x0002**

**DMC\_SEC\_RANGE2\_CTRL 0x0003**

**DMC\_SEC\_RANGE3\_CTRL 0x0004**

**DMC\_SEC\_RANGE4\_CTRL 0x0005**

19:16			New address for index 4
15:12			New address for index 3
11:8			New address for index 2
7:4			New address for index 1
3:0			New address for index 0

**DMC\_PROT0\_RANGE 0x00a0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16			Range end address.
15:0			Range end address.

**DMC\_PROT0\_CTRL 0x00a1**

Bit(s)	R/W	Default	Description
25			Protection 0 write access block function. If enabled, the access wouldn't write to the ddr sdram. If not enabled only generate a interrupt, but the access still wrote to ddr.
24			Protection range 0 enable.
23:16			Each bit to eanble one of the 8 ambus channal for the protection function.
15:0			Each bit to enable one of the 15 channel input for the protection function.

**DMC\_PROT1\_RANGE 0x00a2**

Bit(s)	R/W	Default	Description
31:16			Range end address.
15:0			Range end address.

**DMC\_PROT1\_CTRL 0x00a3**

Bit(s)	R/W	Default	Description
25			Protection 1 write access block function. If enabled, the access wouldn't write to the ddr sdram. If not enabled only generate a interrupt, but the access still wrote to ddr.
24			Protection range 1 enable bit.
23:16			Each bit to eanble one of the 8 ambus channal for the protection function.
15:0			Each bit to enable one of the 15 channel input for the protection function.

**DMC\_WTCH0\_D0 0x00a4****DMC\_WTCH0\_D1 0x00a5****DMC\_WTCH0\_D2 0x00a6****DMC\_WTCH0\_D3 0x00a7****DMC\_WTCH0\_RANGE 0x00a8**

Bit(s)	R/W	Default	Description
31:16			Start address high 16
15:0			Start address high 16

**DMC\_WTCH0\_CTRL 0x00a9**

Bit(s)	R/W	Default	Description
23:0			8 ambus and 16 axibus input channels select.

**DMC\_WTCH0\_CTRL1 0x00aa**

Bit(s)	R/W	Default	Description

31:16			Start address high 16.
2			Watch point 0 enable.
1:0			Watch point0 type. 2'b00: double bytes. Only watchpoint data 15:0 and data strb 1:0 is valid. 2'b01: 4 bytes. 2'b10: 8 bytes. 2'b11, all 16bytes.

**DMC\_WTCH1\_D0** **0x00ab****DMC\_WTCH1\_D1** **0x00ac****DMC\_WTCH1\_D2** **0x00ad****DMC\_WTCH1\_D3** **0x00ae****DMC\_WTCH1\_RANGE** **0x00af**

Bit(s)	R/W	Default	Description
15:0			Start address high 16

**DMC\_WTCH1\_CTRL** **0x00b0**

Bit(s)	R/W	Default	Description
23:0			8 ambus and 16 axibus input channels select.

**DMC\_WTCH1\_CTRL1** **0x00b1**

Bit(s)	R/W	Default	Description
31:16			Start address high 16.
2			Watch point 0 enable.
1:0			Watch point0 type. 2'b00: double bytes. Only watchpoint data 15:0 and data strb 1:0 is valid. 2'b01: 4 bytes. 2'b10: 8 bytes. 2'b11, all 16bytes.

**DMC\_TRAP0\_RANGE** **0x00b2**

Bit(s)	R/W	Default	Description
31:16			Trap0 end address
2			Start0 address.

**DMC\_TRAP0\_CTRL** **0x00b3**

Bit(s)	R/W	Default	Description
31			Trap0 port ID 3 enable.
30			Trap0 port ID 2 enable.
29			Trap0 port ID 1 enable.
28			Trap0 port ID 0 enable.
27			Trap0 port ID 3 subid enable.

26			Trap0 port ID 2 subid enable.
25			Trap0 port ID 1 subid enable.
24			Trap0 port ID 0 subid enable.
16:20			Trap0 port ID 1 ID number.
14:11			Trap0 port ID 1 subid ID number.
8:4			Trap0 port ID 0 ID number.
3:0			Trap0 port ID 0 subid ID number.

**DMC\_TRAP0\_CTRL2      0x00b4**

Bit(s)	R/W	Default	Description
31:17			Not used.
16:20			Trap0 port ID 3 ID number.
14:11			Trap0 port ID 3 subid ID number.
8:4.			Trap0 port ID 2 ID number.
3:0			Trap0 port ID 2 subid ID number.

**DMC\_TRAP1\_RANGE    0x00b5**

Bit(s)	R/W	Default	Description
31:16			Trap end address
15:0			Start address

**DMC\_TRAP1\_CTRL    0x00b6**

Bit(s)	R/W	Default	Description
31			Trap0 port ID 3 enable.
30			Trap0 port ID 2 enable.
29			Trap0 port ID 1 enable.
28			Trap0 port ID 0 enable.
27			Trap0 port ID 3 subid enable.
26			Trap0 port ID 2 subid enable.
25			Trap0 port ID 1 subid enable.
24			Trap0 port ID 0 subid enable.
16:20			Trap0 port ID 1 ID number.
14:11			Trap0 port ID 1 subid ID number.

8:4			Trap0 port ID 0 ID number.
3:0			Trap0 port ID 0 subid ID number.

**DMC\_TRAP1\_CTRL2      0x00b7**

Bit(s)	R/W	Default	Description
31:17			Not used.
16:20			Trap1 port ID 1 ID number.
14:11			Trap1 port ID 1 subid ID number.
8:4.			Trap1 port ID 0 ID number.
3:0.			Trap1 port ID 0 subid ID number.

**DMC\_SEC\_STATUS      0x00b8**

Bit(s)	R/W	Default	Description
31:2			Not used.
1			Write security violation
0			Read security violation.

**DMC\_VIO\_ADDR0      0x00b9****DMC\_VIO\_ADDR1      0x00ba**

Bit(s)	R/W	Default	Description
31:24			Not used. Always 0.
23			ddr0 secure check violation.
22			ddr0 protection 1 vilation.
21			ddr0 protection 0 vilation.
20			ddr0 watch 1 catch
19.			ddr0 watch 0 catch.
18			ddr0 write address overflow. write out of DDR size.
17:15			ddr0 write violation AWPROT bits.
14:0			ddr0_write violation ID.

**DMC\_VIO\_ADDR2      0x00bb****DMC\_VIO\_ADDR3      0x00bc**

Bit(s)	R/W	Default	Description

23			ddr0 read secure check violation.
22			ddr0 read protection 1 violation.
21			ddr0 read protection 0 violation.
20			ddr0 read trap1 violation
19			ddr0 read trap0 violation
18			ddr0 read address overflow. write out of DDR size.
17:15			ddr0 read violation ARPROT bits.
14:0			ddr0 read violation ID.

**DDR0\_ADDRMAP\_0    0x00d0**

Bit(s)	R/W	Default	Description
29:25			ca8
24:20			ca7
19:15			ca6
14:10			ca5
9:5			ca4
4:0			ca3

**DDR0\_ADDRMAP\_1    0x00d1**

Bit(s)	R/W	Default	Description
29:25			ra2
24:20			ra1
19:15			ra0
14:10			ca11
9:5			ca10
4:0			ca9

**DDR0\_ADDRMAP\_2    0x00d2**

Bit(s)	R/W	Default	Description
29:25			ra8
24:20			ra7
19:15			ra6
14:10			ra5

9:5			ra4
4:0			ra3

**DDR0\_ADDRMAP\_3    0x00d3**

Bit(s)	R/W	Default	Description
29:25			ra14
24:20			ra13
19:15			ra12
14:10			ra11
9:5			ra10
4:0			ra9

**DDR0\_ADDRMAP\_4    0x00d4**

Bit(s)	R/W	Default	Description
29:25			ra16 for DDR4 SDRAM
24:20			bg1 for DDR4 SDRAM.
19:15			ba2. or bg0 for DDR4.
14:10			ba1.
9:5			ba0.
4:0			ra15.

**DDR1\_ADDRMAP\_0    0x00d5**

Bit(s)	R/W	Default	Description
29:25			ca8
24:20			ca7
19:15			ca6
14:10			ca5
9:5			ca4
4:0			ca3

**DDR1\_ADDRMAP\_1    0x00d6**

Bit(s)	R/W	Default	Description
29:25			ra2
24:20			ra1

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19:15			ra0
14:10			ca11
9:5			ca10
4:0			ca9

**DDR1\_ADDRMAP\_2      0x00d7**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:25			ra8
24:20			ra7
19:15			ra6
14:10			ra5
9:5			ra4
4:0			ra3

**DDR1\_ADDRMAP\_3      0x00d8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:25			ra14
24:20			ra13
19:15			ra12
14:10			ra11
9:5			ra10
4:0			ra9

**DDR1\_ADDRMAP\_4      0x00d9**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:25			ra16 for DDR4 SDRAM
24:20			bg1 for DDR4 SDRAM.
19:15			ba2. or bg0 for DDR4 SDRAM.
14:10			ba1.
9:5			ba0.
4:0			ra15.

**DMC\_DDR\_CTRL 0x00da**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28			16bit selection for DDR3/4 not balanced mode. 4'b1000: 3Gbyte mode. low 2Gbyte is in 32bits mode. 2G~3G is 16bits mode. 4'b0100: 1.5Gbyte mode. low 1Gbyte is in 32bits mode. 1G~1.5G is in 16bits mode. 4'b0010: 768Mbyte mode. low 512Mbyte is in 32bits mode. 512M~768M is in 16bits mode. 4'b0001: 384Mbyte mode. low 25Mbyte is in 32bits mode. 256M~384M is in 16bits mode. 4'b000 or others balance mode. ether 32bits mode or 16bits mode depends on bit
27			0 : cavnas use 64bytes boundary 1 : canvas use 32bytes boundary.
24:22			3'b000 : ddr3 mode. 3'b001 : ddr4 mode. 3'b010 : lpddr3 mode. 3'b011 : lpddr4 mode.
21			rank1 enable bit. if 1, rank1 used the address map is as bit 5:3 defined.
20			DDR4 BG1 enable bit.
18			always 0.
16			1 only use 16bits data in a 32bits phy data interface. 0 : normal data interface.
5:3			DDR rank 1 size. 3'b000 : DDR rank 1 is 128Mbyte. 3'b001 : DDR rank 1 is 256Mbyte. 3'b010 : DDR rank 1 is 512Mbyte. 3'b011 : DDR rank 1 is 1Gbyte. 3'b100 : DDR rank 1 is 2Gbyte. 3'b101 : DDR rank 1 is 4Gbyte. others : reserved.
2:0			DDR rank 0 size. 3'b000 : DDR rank 0 is 128Mbyte. 3'b001 : DDR rank 0 is 256Mbyte. 3'b010 : DDR rank 0 is 512Mbyte. 3'b011 : DDR rank 0 is 1Gbyte. 3'b100 : DDR rank 0 is 2Gbyte. 3'b101 : DDR rank 0 is 4Gbyte. others : reserved.

**DDR\_APB\_SEC\_CTRL 0x00db**

Bit(s)	R/W	Default	Description
19:16			DMC normal APB register secure control.
19:			1: all can write those register. 0: the APB_PROT[0] must match the bit 0 to write those register.
15:12			DMC sticky APB register secure control.
15.			1: All APB bus can write those registers. 0: The APB_PROT[0] must match the bit 12 to write those register.
11:8.			DMC DDR PLL clock related APB register secure control.
11.			1: All APB bus can write those registers. 0: The APB_PROT[0] must match the bit 8 to write those register.
7:4.			DMC DDR SDRAM protocol control register control
11.			1: All APB bus can write those registers. 0: The APB_PROT[0] must match the bit 4 to write those register.
3:0.			LPDDR4 PHY APB register secure control.
3			1: All APB bus can write those registers. 0: The APB_PROT[0] must match the bit 0 to write those register.

**DMC\_TEST\_WRCMD\_ADDR 0x00dc****DMC\_TEST\_RDRSP\_ADDR 0x00dd****DMC\_TEST\_RDCMD\_ADDR 0x00de****DMC\_TEST\_WDG 0x00df**

Bit(s)	R/W	Default	Description
31:16			Write response watch dog.
15:0			Read response watch dog.

**DMC\_TEST\_STA 0x00e0**

Test start address.

For non-sha mode, the last 5 bits would be ignored. The test address at 32bytes boundary.

For sha mode, address must be in 64 bytes boundary. That mean the last 6 bits must be 0.

**DMC\_TEST\_EDA 0x00e1**

Test end address.

For non-sha mode, the last 5 bits would be ignored. The test address at 32bytes boundary.

For sha mode, address must be in 64 bytes boundary. That mean the last 6 bits must be 1.

**DMC\_TEST\_CTRL 0x00e2**

Bit(s)	R/W	Default	Description
31			enable test.

30			when enable test, enable the write to DDR function.
29			when enable test, enable the read from DDR function.
28			when enable test, enable the sha calculation function must be same as read enable but without write function.
27			enable to compare data. when do the read enable to enable the error comparaison. suppose the read data should be same as the data in the write buffer.
26			reserved.
25			<p>address generation type.</p> <p>0: continuous increase the address in the range of test start address and test end address.</p> <p>1: test module would pick the random address from test start address and test end address.</p>
24			<p>0 : use the DMC_TEST_NUM register as the counter of test numbers.</p> <p>For write if the write command number == the DMC_TEST_NUM, the write is done.</p> <p>For read if the read command number == the DMC TEST_num, the read is done.</p> <p>For one read command can be repeated repeat number times.</p> <p>1 : finished at end address.</p>
23			<p>1 : the first write is {WD3, WD2, WD1, WD0}, then the latter is the previous data plus a pattern. ( { + WD7, + WD6, + WD5, + WD4}).</p> <p>0 : the WDATA is the data in write register.</p>
23			reserved.
22:20			read repeat times. for non-sha function, we can define multi times of the read. the test module would repeat the same address repeat times.
19			<p>limit write.</p> <p>0: no outstanding write request limitation.</p> <p>1: limit the outstanding write commands to the number of bits [15:8]</p>
18			<p>limit read.</p> <p>0. no outstanding read request limitation.</p> <p>1. limit the read outstanding request to the number of bits[7:0].</p>
17:16			sha mode for sha function enabled. 00 : not used. 01 : sha1. 2: sha2-256. 3: sha2_224. not used in GXL fixed to be Sha 2.
15:8.			write outstanding commands limit.
7:0			read outstanding commands limit.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			Test done bit. Write 1 to clean.
30			Indicate address err
29:5			Not used.
4			Sha done. Write 1 to clean.
3			Write done. Write 1 to clean.
2			Read done. Write 1 to clean
1			Write watchdog triggered. Write 1 to clean
0			Read watchdog triggered. Write 1 to clean.

**DMC\_TEST\_SHA\_MSG0** 0x00f8**DMC\_TEST\_SHA\_MSG1** 0x00f9**DMC\_TEST\_SHA\_MSG2** 0x00fa**DMC\_TEST\_SHA\_MSG3** 0x00fb**DMC\_TEST\_SHA\_MSG4** 0x00fc**DMC\_TEST\_SHA\_MSG5** 0x00fd**DMC\_TEST\_SHA\_MSG6** 0x00fe**DMC\_TEST\_SHA\_MSG7** 0x00ff

The following registers' base address is 0xff638400. Each register takes 4 byte address.

Each register's final address = 0xff638400 + offset \* 4.

**DMC\_DRAM\_TMRD** 0x0000

Bit(s)	R/W	Default	Description
3:0			tMRD.

**DMC\_DRAM\_TRFC** 0x0001

Bit(s)	R/W	Default	Description
9:0			tRFC

**DMC\_DRAM\_TRP** 0x0002

Bit(s)	R/W	Default	Description
21:16			tRP for precharge all banks.
5:0			tRP for precharge one bank.

**DMC\_DRAM\_TRTW** 0x0003

Bit(s)	R/W	Default	Description
5:0			tRTW

**DMC\_DRAM\_TCL** 0x0004

Bit(s)	R/W	Default	Description
5:0			CL/tRL. read latency.

**DMC\_DRAM\_TCWL** 0x0005

Bit(s)	R/W	Default	Description
5:0			CWL: write latency.

**DMC\_DRAM\_TRAS** 0x0006

Bit(s)	R/W	Default	Description

7:0			tRAS. minimum active to precharge time for same bank.
-----	--	--	---

**DMC\_DRAM\_TRC 0x0007**

Bit(s)	R/W	Default	Description
7:0			tRC. minimum active to active time for same bank.

**DMC\_DRAM\_TRCD 0x0008**

Bit(s)	R/W	Default	Description
7:0			tRCD active to read/write timing for same bank.

**DMC\_DRAM\_TRRD 0x0009**

Bit(s)	R/W	Default	Description
21:16			tRRD_I active bank A to active B in same band group for DDR4.
5:0			tRRD/tRRD_s active bank A to active bank b time. tRRD_s: active bank A to active bank b in different bank group for DDR4.

**DMC\_DRAM\_TFAW 0x000a**

Bit(s)	R/W	Default	Description
8:0			tFAW. four active command windows

**DMC\_DRAM\_TRTP 0x000b**

Bit(s)	R/W	Default	Description
5:0			tRTP.

**DMC\_DRAM\_TWR 0x000c**

Bit(s)	R/W	Default	Description
5:0			tWR.

**DMC\_DRAM\_TWTR 0x000d**

Bit(s)	R/W	Default	Description
5:0			tWTR.

**DMC\_DRAM\_TCCD 0x000e**

Bit(s)	R/W	Default	Description
19:16			tCCD/tCCD_I.
3:0			tCCD/tCCD_s read to read command time or write to write command time.

**DMC\_DRAM\_TEXSR 0x000f**

Bit(s)	R/W	Default	Description
9:0			tEXSR. EXIT SELF-REFRESH to read/write command.

**DMC\_DRAM\_TXS 0x0010**

Bit(s)	R/W	Default	Description
9:0			tEXSR. EXIT SELF-REFRESH to read/write command.

**DMC\_DRAM\_TXP 0x0011**

Bit(s)	R/W	Default	Description
3:0			tXP. EXIT power down to other command time

**DMC\_DRAM\_TXPDLL 0x0012**

Bit(s)	R/W	Default	Description
9:0			tXPDLL, EXIT power down to read/write command time(need to relock PLL).

**DMC\_DRAM\_TZQCS 0x0013**

Bit(s)	R/W	Default	Description
7:0			ZQCS command to other command time.

**DMC\_DRAM\_TCKSRE 0x0014**

Bit(s)	R/W	Default	Description
4:0			enter self-refresh to disable clock time.

**DMC\_DRAM\_TCKSRX 0x0015**

Bit(s)	R/W	Default	Description
4:0			enable clock to exit self-refresh time.

**DMC\_DRAM\_TCKE 0x0016**

Bit(s)	R/W	Default	Description
4:0			CKE high or low minimum time.

**DMC\_DRAM\_TMOD 0x0017**

Bit(s)	R/W	Default	Description
4:0			tMOD. MRR/MRW to other command time.

**DMC\_DRAM\_TDQS 0x0018**

Bit(s)	R/W	Default	Description

3:0			tDQS. the delay to access different rank.
-----	--	--	---

**DMC\_DRAM\_TRSTL 0x0019**

Not used.

**DMC\_DRAM\_TZQLAT 0x001a**

Bit(s)	R/W	Default	Description
5:0			ZQ LATCH command to other comand timing in LPDDR4 mode.

**DMC\_DRAM\_TMRR 0x001b**

Bit(s)	R/W	Default	Description
7:0			tMRR not used in DMC. not support MR READ.

**DMC\_DRAM\_TCKESR 0x001c**

Bit(s)	R/W	Default	Description
9:0			tCKESR. CKE low minimum pulse in self refresh mode.

**DMC\_DRAM\_TDPPD 0x001d**

Not support.

**DMC\_DRAM\_DFITCTRLDELAY 0x001e**

Bit(s)	R/W	Default	Description
3:0			DFI_t_ctrldealy

**DMC\_DRAM\_DFITPHYWRDATA 0x001f**

Bit(s)	R/W	Default	Description
5:0			dfi_t_phy_wrdata.

**DMC\_DRAM\_DFITPHYWRLAT 0x0020**

Bit(s)	R/W	Default	Description
5:0			dfi_t_phy_wrlat. in DDR3/4/LPDDR3 mode: WL -5. in LPDDR4 mode: WL -5 + 2.

**DMC\_DRAM\_DFITRDDATAEN 0x0021**

Bit(s)	R/W	Default	Description
5:0			dfi_t_rddata_en. in DDR3/4/LPDDR3 mode: RL -5. in LPDDR4 mode : RL -5 + 1.

**DMC\_DRAM\_DFITPHYRDLAT 0x0022**

Bit(s)	R/W	Default	Description
5:0			dfi_t_rdlat.

**DMC\_DRAM\_DFITCTRLUPDMIN 0x0023**

Bit(s)	R/W	Default	Description
7:0			CTRLUPD_MIN minimux clock cycle to maintain CTRLUPD_REQ.

**DMC\_DRAM\_DFITCTRLUPDMAX 0x0024**

Bit(s)	R/W	Default	Description
7:0			CTRLUPD_MAX. maximum clock cycle to maintain CTRLUPD_REQ if no CTRLUPD_ACK response.

**DMC\_DRAM\_DFITMSTRRESP 0x0025**

Not used.

**DMC\_DRAM\_DFITREFMSKI 0x0026**

Not used.

**DMC\_DRAM\_DFITCTRLUPDI 0x0027**

Not used.

**DMC\_DRAM\_DFITDRAMCLK 0x0028**

Bit(s)	R/W	Default	Description
17			dram clk1 enable.
16			dram clk0 enable.
15:8			DRAM CLK disable waiting time
7:0			DRAM CLK enable enable timer

**DMC\_DRAM\_DFITLPRESP 0x002a**

Bit(s)	R/W	Default	Description
3:0			dfi_lp_ctrl_req response time. after dfi_lp_ctrl_req asserted, and after response time if there's still no dfi_lp_ack response, then drop the dfi_lp_ctrl_req.

**DMC\_DRAM\_DFITPHYMSTR 0x002b**

Bit(s)	R/W	Default	Description
15			1: enable DFIPHYSMASTER INTERFACE 0 disable DFIPHYSMASTER en response. always 0 we would use DFI_RETRAIN function for PHY retrain required from LPDDR4.

**DMC\_DRAM\_TCKECK 0x002c**

Bit(s)	R/W	Default	Description
4:0			tCKECK from CKE low to assert dfi_dram_clk_disable time. this time + dfi_t_ctrl_delay

**DMC\_DRAM\_TREFI 0x002d**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24			tZQCI dmc send zqci period. unit is how much auto refresh period.
23:16			pvti dmc send dfi_ctrlupd_req period. unit is one auto refresh period.
15:8			tREFI.dmc send auto refresh command period. unit is 100ns.
7:0			t100ns period. unit is dmc clock cycles

**DMC\_DRAM\_TSR 0x002e**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0			tSR. self refresh enter to exit time.

**DMC\_DRAM\_TCCDMW 0x002f**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0			4*tCCD in LPDDR4 mask write.

**DMC\_DRAM\_TESCKE 0x0030**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0			tESCKE. enter self refresh to power time for LPDDR4.

**DMC\_DRAM\_TREFI\_DDR3 0x0031**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
7:0			8*DDR3 SDRAM tREFI time . the unit is t100ns. use this to check in 8*tREFI time, the DMC should sent more than 16 auto REFRESH command.

Bit(s)	R/W	Default	Description
12			rank1 ODT default. default value for ODT[1] pins if theres no read/write activity.
11			rank1 ODT write sel. enable ODT[1] if there's write occur in rank1.
10			rank1 ODT write nsel. enable ODT[1] if theres's write occur in rank0.
9			rank1 odt read sel. enable ODT[1] if there's read occur in rank1.
8			rank1 odt read nsel. enable ODT[1] if there's read occure in rank0.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
4			rank0 ODT default. default value for ODT[0] pins if there's no read/write activity.
3			rank0 ODT write sel. enable ODT[0] if there's write occur in rank0.
2			rank0 ODT write nsel. enable ODT[0] if there's write occur in rank1.
1			rank0 odt read sel. enable ODT[0] if there's read occur in rank0.
0			rank0 odt read nsel. enable ODT[0] if there's read occur in rank1.

**DMC\_DRAM\_DFIODTCFG1 0x0085**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
27:24			ODT length for BL8 read transfer.
19:16			ODT length for BL8 write transfer.
12:8.			ODT latency for reads. suppose to be 0.
4:0.			ODT latency for writes. suppose to be 0

**DMC\_DRAM\_MCFG 0x0086**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12			1: dbi inversion. 0: dbi high inversion.
11			1: dbi read enable. 0: dbi not enabled.
10			1: enable staggered chip select for 2 ranks DRAM.
9			1: enable send auto refresh command to DDR SDRAM when PCTL is in CFG/STOP state.
8			send auto refr cmd before enter register triggered self refresh
4			send auto refr cmd after exit register triggered self refresh mode.
3			disable dram clock after enter register triggered self refresh.
2			send DFI_LP_REQ to PHY after enter register triggered self refresh mode.
1			send DRAM to power down mode after enter self refresh. ONLY for LPDDR4.
0			send DFI_CTRLUPD_REQ after exit register triggered self refresh.

**DMC\_DRAM\_DFI\_CTRL 0x0089**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
20			siu_dfi1_phymstr_ack_en
19			siu_dfi_phymstr_req_and

18			siu_dfi_phymstr_req_or
17			siu_dfi_phymstr_type_sel
16			siu_dfi_phymstr_cs_sel
15			siu_dfi1_lp_en
14			siu_dfi_lp_ack_and
13			siu_dfi_lp_ack_or
12			siu_dfi1_init_start_en
11			siu_dfi_init_com_and
10			siu_dfi_init_com_or
9			siu_dfi1_freq_en
8			siu_dfi1_dram_clk_dis_en
7			siu_dfi_phyupd_type_sel
6			siu_dfi1_phyupd_ack_en
5			siu_dfi_phyupd_req_and
4			siu_dfi_phyupd_req_or
3			siu_dfi_ctrlupd_ack_and
2			siu_dfi_ctrlupd_ack_or
1			siu_dfi1_ctrlupd_req_en
0			siu_dfi1_cmd_en

**DMC\_DRAM\_DFIINITCFG 0x008a**

Bit(s)	R/W	Default	Description
31.			dfi_init_complete status. read only.
15:14			Frequency set 1 dfi_freq_ratio value.
12:8			Frequency set 1 dfi_freq value.
7:6			Frequency set 0 dfi_freq_ratio value.
5:1			Frequency set 0 dfi_freq value.
0.			dfi_init_start value can be use manually config dfi_init_start signal.

**DMC\_DRAM\_ZQ\_CTRL 0x008b**

Bit(s)	R/W	Default	Description
2			send ZQCS command to RANK0 then send comand to RANK1.

1			send ZQCS command to both RANK0 and RANK1 together.
0			send ZQCS command to only rank0.

**DMC\_DRAM\_APD\_CTRL 0x008c**

Bit(s)	R/W	Default	Description
19:16			DFI_LP_WAKEUP value in APD DFI_LP_REQ mode
12			1: exit power down slow mode(waiting PLL LOCK). 0 : fast mode.
11			enable DFI_LP_REQ when enter Auto power down mode.
10			disable DFI_clk_disable when enter auto power down mode.

**DMC\_DRAM\_ASR\_CTRL 0x008d**

Bit(s)	R/W	Default	Description
23:20			DFI_LP_WAKEUP value in self refresh DFI_LP_REQ mode.
17			send REFRESH command after exit from auto self refresh mode(ASR).
16			send REFRESH command before enter to Auto self refresh mode(ASR).
15			send ZQCS command after exit from Auto self refresh mode(ASR).
14			send dfi_ctrl_upd after exit from ASR mode
13			send power down command when enter ASR mode. //for LPDDR4 only.
12			set the PHY enter LP2 mode after enter ASR mode.
11			send DFI_LP_REQ after enter ASR mode.
10			set DFI_CLK_DISABLE after enter ASR mode.
9:0			0 disable auto ASR mode.

**DMC\_DRAM\_PHYMSTR\_CTRL 0x0090**

Not used.

**DMC\_DRAM\_DFIODTRANKMAP 0x0091**

Not used.

**DMC\_DRAM\_REFR\_CTRL 0x0092**

Bit(s)	R/W	Default	Description
17:8			auto refresh request pending cnt if there's page hit request.
6			Disabled auto refresh command if over 16 auto refresh command sent in 2 TREFI_DDR3 period
5			enable dmc send ZQCS command .

4.			enable dmc send DFI_CTRUPD_REQ.
3:1			how many refresh command send for one period. = this number + 1
0			enable dmc send auto refresh command.

**DMC\_DRAM\_FREQ\_CTRL 0x0093**

Bit(s)	R/W	Default	Description
31 .			Wiret 1 to change frequency read 0: finished.
30:9			Not used.
9.			1 : FREQ MRW done. Let FREQ change machine continue.
8			Freq wait. 1 when freq change finishes, state machine stop at self refresh state in case there's something need to handle. // 0 after freq change finishes the state machine go back to access state.
7			When change PLL setting, disable dmc clock
6			When change PLL setting, disable PHY dficlk and dfictlclk.
5			Check vpu_sleep_en ==1 when do FREQ change. If vpu_sleep_en == 0, just wait.
4			Nxt frequency selection. 1 = freq1. 0 = freq0.
3:1.			Not used.
0.			Current frequency selection.

**DMC\_DRAM\_SCFG 0x0094**

Bit(s)	R/W	Default	Description
2:0			only one bit can be high at same time.
2			1 : to ask PCTL enter ACCESS STATE. 0 : deassert the request.
1			1 : to ask PCTL enter SELF REFRESH STATE. 0 : deassert the request.
0			1 : to ask PCTL enter STOP/CONFIG STATE . 0 : deassert the request.

**DMC\_DRAM\_STAT 0x0095**

Bit(s)	R/W	Default	Description
27:23			dram_sr_state
22:20			stop_st
19:15			sleep_st
14:12			ACCESS STATUS 0 : ACCESS is in normal working mode. 1 : ACCESS sending precharege command. 2 : ACCESS sending AUTO REFESH command.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			3 : ACCESS sending DIF_CTRLUPD_REQ command. 4 : ACCESS sending ZQCS command to DDR DRAM(ZQCAL for LPDDR4). 5 : ACCESS sending ZQLATCH command to LPDDR4 only.
11:8			APD STATUS: 0 : APD_IDLE 1 : APD sending PRECHARGE command 2 : APD sending CKE low command 3 : APD sending DISABLE DRAM CLOCK command 4 : APD sending DFI_LP_CTRL_REQ 5 : APD in Auto Power down mode. 6 : APD deassert DFI_LP_CTRL_REQ 7 : APD sending enable DRAM CLOCK command 8 : APD sending out CKE high command.
7:4			DRAM_STATUS: 0 : DRAM IDLE 1 : DRAM_STOP/DRAM_CFG 2 : DRAM_ACCESS 3 : DRAM_SLEEP 4 : DRAM_APD(AUTO POWER DOWN) 5 : IDLE -> STOP/CONFIG 6 : STOP -> SLEEP 7 : STOP -> ACCESS 8 : ACCESS -> SLEEP 9 : ACCESS -> STOP A : ACCESS -> APD B : SLEEP -> STOP C : SLEEP -> ACCESS D : APD -> ACCESS
3			Reserved.
2			1 : DRAM enter normal working state.
1			1 : DRAM enter sleep state. self refresh state.
0			1 : dram enter cfg state.

**DMC\_DRAM\_STAT1      0x0096**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11:8			freq_st.
7:5			train_st
4:0			dram_phy_st

**DMC\_PHY\_RETRAINING\_CTRL 0x0097**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			phy_retraining enable.
30			check vpu sleep_en.
23:0			retraining period unit : 100ns.

**DMC\_DFI\_ERR\_STAT 0x0098**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:20			not used.
9			ddr0_dfi_error
8:5			ddr0_dfi_error_info.
4			ddr1_dfi_error.
3:0			ddr1_dfi_error_info.

**DMC\_DRAM\_MRW\_CTRL 0x0099**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31			write 1 to initial a MRW command read 0 finished.
23:16			MR addr. DDR4 case : 18:16 ba[2:0]. 29:19 BG[1:0].
15:0			opcode.

**DMC\_DRAM\_DFI\_SWAP\_0 0x00a0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0			dfi_act_n function select

**DMC\_DRAM\_DFI\_SWAP\_1 0x00a1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0			dfi_ras_n function select

**DMC\_DRAM\_DFI\_SWAP\_2 0x00a2**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0			dfi_cas_n function select

**DMC\_DRAM\_DFI\_SWAP\_3 0x00a3**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5:0			dfi_we_n function select

**DMC\_DRAM\_DFI\_SWAP\_4      0x00a4**

Bit(s)	R/W	Default	Description
5:0			dfi_bg0 function select

**DMC\_DRAM\_DFI\_SWAP\_5      0x00a5**

Bit(s)	R/W	Default	Description
5:0			dfi_bg[1] function select

**DMC\_DRAM\_DFI\_SWAP\_6      0x00a6**

Bit(s)	R/W	Default	Description
5:0			dfi_ba[0] function select

**DMC\_DRAM\_DFI\_SWAP\_7      0x00a7**

Bit(s)	R/W	Default	Description
5:0			dfi_ba[1] function select

**DMC\_DRAM\_DFI\_SWAP\_8      0x00a8**

Bit(s)	R/W	Default	Description
5:0			dfi_ba[2] function select

**DMC\_DRAM\_DFI\_SWAP\_9      0x00a9**

Bit(s)	R/W	Default	Description
5:0			dfi_a[0] function select

**DMC\_DRAM\_DFI\_SWAP\_10      0x00aa**

Bit(s)	R/W	Default	Description
5:0			dfi_a[1] function select

**DMC\_DRAM\_DFI\_SWAP\_11      0x00ab**

Bit(s)	R/W	Default	Description
5:0			dfi_a[2] function select

**DMC\_DRAM\_DFI\_SWAP\_12      0x00ac**

Bit(s)	R/W	Default	Description
5:0			dfi_a[3] function select

**DMC\_DRAM\_DFI\_SWAP\_13      0x00ad**

Bit(s)	R/W	Default	Description
5:0			

5:0			dfi_a[4] function select
-----	--	--	--------------------------

**DMC\_DRAM\_DFI\_SWAP\_14 0x00ae**

Bit(s)	R/W	Default	Description

## 13.2 NAND

### 13.2.1 Overview

A311D supports SLC/MLC/TLC NAND Flash with 60-bit ECC.

### 13.2.2 Descriptor Commands

#### Command “Standby”

All CEs are high, all other signals are “don’t care”, the bits [9:0] specify how many extra NAND cycles the controller stays in “standby”, if the number is “0”, only one NAND cycle, if the number is 10, the controller will stay in “standby” for 11 NAND cycles.

#### Command “Idle”

CE is low, ALE and CLE is low, WE and RE is high, the NAND bus is taken over by controller, but the bus is let to idle for one NAND cycle, if extra NAND cycles number is set, then extra NAND cycles is idled, useful when NAND controller needs time to switch to another mode, or wait for RB.

#### Command “Command”

NAND command is sent, CE is low, ALE is low, CLE is high, WE is low and RE is high, usually only one NAND CE is low, all the other 3 should be high, otherwise the NAND command is accepted by multiple Dies and may cause conflict problem, but it is fine when used to reset the NAND, the command itself is sent by bit 7 to bit 0, one command sends one NAND command.

#### Command “Address”

NAND address cycle, the CE is low, ALE is high, CLE is low, WE is low and RE is high. Usually only one NAND CE is low, all the other 3 CEs should be high. The address is sent in the bit 7 to bit 0, it lasts one NAND cycle.

#### Command “Data to NAND”

Write NAND bus directly by this command, CE is low, ALE and CLE are low, WE is low and RE is high, the low bit7 to bit 0 is write to NAND flash when this command is done, it lasts one NAND command cycle. Usually used to program NAND features, it is very low efficient to program NAND by this command, could be used to debug NAND flash software.

#### Command “NAND to Data”

Read NAND bus and save the data to registers, CE is low, ALE and CLE are low, WE is high and RE is low, the NAND output is locked in registers at perfect timing, the extra NAND cycles will make this command repeats extra NAND cycle, if it is “0”, only one byte is locked in registers, since the registers used to lock the data is only 32 bits, extra NAND cycles number larger than 3 will cause the data overflow. This command is used to read status and features from NAND, not for read NAND data, it is very low efficient to read NAND by this command, it could be used to debug NAND software.

#### Command “Sync Read”

Same as “NAND to Data”, used in synchronous mode, each NAND cycle will read in two bytes in synchronous mode.

#### Command “RB pin”

Hardware ready/busy detect with timer and interrupt, the timer is bit 4 to bit 0, it is power of 2 NAND cycle, for example, if timer is set to 10, then  $2^{10}$  or 1024 NAND cycles is set to timer out the RB command. The maximum setting is 31, that is  $2^{31}$  NAND cycles. Or 42 seconds when NAND cycle is 20 ns. When the RB waiting is timed out, the hardware is still in “waiting”, an interrupt is sent to CPU, the “RB” command can be programmed to send out interrupt when RB is high when the correspond INT bits is set to high, once RB is high, the command queue advanced to next command, no matter interrupt or not, interrupt setting is “one time setting”, it means one RB command can be programmed with interrupt, the next can be programmed without interrupt. There are few bits in the RB command for software debugging purpose.

it can be set to different numbers to tell which RB command is interrupted. CPU can read out the NAND status registers to tell which RB causes interrupt.

### **Command “RB IO”**

assume the NAND controller is used without ready/busy pin, the ready/busy is checked through status register, This command should be used with NAND read status command, like the old RB command, this command is designed with option to check which IO bits as ready/busy, “IO6”, “IO5” and “IO4”, and “INT6”, “INT5” and “INT4” to issue “IRQ” if “Ready”, time out logic is the same as old RB, in case of “Read” NAND, an extra “0x00” command is needed to switch NAND flash back to “Read” mode.

The RB IO command is associated with CE state, there is no CE option in RB IO command, valid CE from previous command is used.

NAND status is checked every 16 NAND cycles, if not ready when time out, an “IRQ” is issued and timer is reset.

Change to read status mode.

Set proper timer out parameter.

Monitor which IO bits, IO6, IO5 or IO4.

Set IRQ option, set NAND\_CFG cmd\_irq\_en bit.

Return back to read mode if needed.

### **Command “MEM to NAND”**

DMA command to send data from memory to NAND, this command consist of ECC mode, the data is read from DDR memory by NAND controller at 64 bits/system cycle, BCH encoded by hardware and sent to NAND in the fly. The NAND data address can be programmed by register or command “set address”.

The data size can be any number, if ECC is off, the exact number of data bytes are read from DDR memory and sent to NAND without ECC encode, if ECC is on, and final page is not 512 bytes, then “0xff” is appended to the data to make it 512 bytes and send to BCH encoded and send to NAND.

When ECC is off, no spare data bytes are read from DDR, the data is sent exactly the same as DDR. When ECC is on, 2/16/0 bytes of spare bytes are read from DDR and appended to 512/1024 main data, encoded and parity bytes all sent to NAND.

The final BCH code word is rounded to integer number of bytes, see BCH table.

If ECC is OFF, the command writes [13:0] number of bytes to NAND.

If ECC is ON, the command writes “pages” of bytes to NAND.

If “short” is 0, the page size is BCH code data size, 512 or 1024.

If “short” is 1, shortened BCH mode, the page size is “page size”\*8 bytes.

The number of pages is up to 63.

Data randomization option, if cmd[19] is set to “1” and the random seed is not equal to “0”, the data and parity written to NAND is randomized with PRBS random number, the same seed must be used to read the page back.

Random seed is set by command “Seed” cmd[14:0], suggest to use NAND physical address as “seed”.

### **Command “NAND to MEM”**

DMA command to read data from NAND and save to DDR, this command consist of ECC mode, and data size, this command will correct the data by hardware and save the decode result information to DDR too. The data address in DDR is programmed by “set address” command, if not programmed the address increases to next available data space.

When ECC is off, the data is save to DDR without change, the information bytes is also saved in DDR with ECC mode bits off, no spare bytes, when ECC is on, the data is BCH decoded and corrected by hardware,

if the data size is less than 512/1024, more data will be read out from NAND, but only the required number of bytes are sent to DDR.

If ECC is OFF, the command reads [13:0] number of bytes from NAND.

If ECC is ON, the command reads “pages” of bytes to NAND.

If “short” is 0, the page size is BCH code data size, 512 or 1024.

If “short” is 1, shortened BCH mode, the page size is “page size”\*8 bytes.

The number of pages is up to 63.

Data randomization option is the same as “MEM to NAND”.

### **Command “Set Address”**

DDR address setup command, used to change the memory address when read or write NAND, the D/S bits is for data or spare, “0” for data, “1” for spare, L/H is for low and high 16 bits of address, “0” for low 16 bits, “1” for high 16 bits, the DDR address is 32 bits.

This command has nothing to do with NAND bus, but it will take one NAND command to execute, one NAND idle command is used in time.

Mode	Cmd[18:17]	Description
Data	00	Set Data Address
Info	01	Set Info Address
Status	10	Set Status Address

### **Command “STS”**

Read status and save to DDR memory, the status registers is 32 bits, with

Field	Name	Description
15:0	Sts	Status
23:16	Sts counter	Sequence number
31	Done	This status is valid.

STS 1: read status once, without IRQ.

STS 2: read status twice, with IRQ.

If NAND\_CFG[20] Sts\_irq\_en is set to “1”, the STS 2 command will issue an IRQ to system, if used after NAND read command “N2M”, it guarantees the DMA is done. Because the STS itself is a DMA command, it will wait till the previous DMA command done before its DMA.

STS 2 command resets the sequence number, the sequence number in itself is the number of STS 1’s before IRQ, wrap around to 8 bits.

### **Command “Set Seed”**

Random seed for data randomizer, any number except 0 starts random number generator, if “N2M” or “M2N” random bit is set, the random number is XORed with data.

Set none zero random seed, in cmd[14:0].

Set cmd[19] of “N2M” or “M2N” to 1, enable scrambler.

Use same seed to program/read the same NAND page.

### 13.2.3 Register Definitions

The base address of NAND registers is 0xffe07000, and the final address of each register is listed below:

**Table 13-1 NAND Register List**

Register Name	Description	Address	R/W
P_NAND_CMD	Write Command and Read Status	Base + 0x00	R/W
P_NAND_CFG	Configuration	Base + 0x04	R/W
P_NAND_DADR	Data Address	Base + 0x08	R/W
P_NAND_IADR	Information Address	Base + 0x0c	R/W
P_NAND_BUF	Read Data Buffer	Base + 0x10	R
P_NAND_INFO	Information	Base + 0x14	R
P_NAND_DC	DDR interface	Base + 0x18	R
P_NAND_ADR	DDR Address	Base + 0x1c	R
P_NAND_DL	DDR Low 32 Bits Data	Base + 0x20	R/W
P_NAND_DH	DDR High 32 Bits Data	Base + 0x24	R/W
P_NAND_CADR	Command Queue Address	Base + 0x28	R/W
P_NAND_SADR	Status Address	Base + 0x2c	R/W
P_NAND_PINS	CS2: SDRAM/NAND pin sharing	Base + 0x30	R/W
P_NAND_VER	Version number	Base + 0x38	R

#### P\_NAND\_CMD

Write : Send NAND command to controller, the command format is specified in previous section.

Bit(s)	Name	Description
21:0	Cmd	NAND command sent to NAND queue buffer
30	Cmd_go	When 1, and NAND bus is in waiting Rb mode, due to time out or longer than expected Rb waiting, the command queue will move on by disable RB waiting in current command.
31	Cmd_reset	When 1 the NAND command queue buffer is reset to zero.

Read : Read NAND controller status

Bit(s)	Name	Description
19:0	Cmd_curr	NAND command current on NAND bus, still going, not finished.
24:20	Cmd_cnt	Number of NAND commands still in NAND command queue buffer, the buffer size is 32.
25	Timer out	When 1 wait Rb command timed out.

26	Rb0	Current Rb0 status, 1: ready, 0: busy.
27	Rb1	Current Rb1 status, 1: ready, 0: busy.
28	Rb2	Current Rb2 status, 1: ready, 0: busy.
29	Rb3	Current Rb3 status, 1: ready, 0: busy.
30	Mem_rdy	When 1, DDR interface is idle and ready to accept memory movement request.
31	Ecc_rdy	When 1, ECC BCH encoder/decoder is idle and ready to accept encode or decode activity.

**P\_NAND\_CFG**

Bit(s)	Name	Description
4:0	Bus_cyc	The number of system clock cycles in one NAND cycle – 1, for example, if the bus_cyc is 3, then the NAND cycle is 4 system clock cycles, the minimum setting is 3, the maximum setting is 31. Program this register according NAND timing mode.
9:5	Bus_tim	The timing to lock the NAND data when read NAND data or status, please refer to "Timing Calculator" for details.
11:10	Sync	00: Async mode 01: Micron Sync mode 10: Toshiba-Samsung toggle mode
12	Cmd_start	When set to "1", if the NAND controller internal 32 command buffer has less than 16 commands, the command DMA starts reading commands from DDR and saves them to internal buffer, the DMA keeps watching the internal buffer, reads whenever there are less than 16 commands left, if an all "zero" command is met, This bit is cleared and current command DMA is done.
13	Cmd_auto	When set to '1', the command DMA will check the previous command queue end location, whether it is changed from all "zero" back to valid command, the auto check period is 1 ms.
14	Apb_mode	Special NAND mode for ROM boot or debug, when 1, DDR interface is redirected to APB register, all the read/write activities are through APB registers. When used in ROM boot and DDR is not ready.
15	Spare_only	When 1, the NAND controller read NAND with/without ECC, but only save the information bytes into DDR memory, the main data is discarded, designed for software to survey the NAND flash spare bytes and prepare NAND programming.
16	Sync_adj	Used to adjust data timing in sync or toggle mode, 0: default timing, 1: delay 1 system clock cycle.
20	Sts_irq_en	Enable STS IRQ.
21	Cmd_irq_en	Enable RB pin or RB IO IRQ.
26	Oob_on	Set to 1 oob_mode 16/0, Set to 0 no oob bytes.
27	Oob_mode	New in M8 v2, Set to 1 enable new oob mode. First page 16 bytes, all other pages 0 byte.

Bit(s)	Name	Description
28	Dc_ugt	Set NAND controller DDR interface to Urgent mode.
29	Nand_wpn	When 1, the NAND wpn pin is set to low, the NAND is in write protection mode, default to 0, the NAND is not protected.
30	Core_power	When 1, internal NAND controller core clock gating is override to always on. The clock gating is disabled.
31	Top_power	When 1, internal NAND top clock gating is override to always on, the clock gating for top is disabled.

### P\_NAND\_DADR

Set DDR data address by registers, the address is 32 Bits, since the DDR data address can also be set by NAND commands, when both happens at the same time, register setting is ignored, the NAND command setting takes effect. Software should avoid conflict address setting.

### P\_NAND\_IADR

Set DDR information (spare bytes) address by registers, the address is 32 Bits, since the DDR information address can also be set by NAND commands, when both happens at the same time, register setting is ignored, the NAND command setting takes effect. Software should avoid conflict address setting.

### P\_NAND\_BUF

When read NAND status, features or data, the results are buffer in this register, the register is 32 Bits, it can only hold 4 bytes, if the host not doesn't read out the results, it will be over written by the following "read".

### P\_NAND\_INFO

One 32 Bits information per each 512 bytes in ECC mode.

Bit(s)	Name	Description
7:0	Info 0	Information (spare) byte 0, errors already corrected by BCH.
15:8	Info 1	Information (spare) byte 1, errors already corrected by BCH
21:16	Pages	Count down page number in current DMA read, starts from the total page size, count down to 1.
28:24	Errcnt	Number of errors corrected by BCH in current page, 0 means no error in current page, 0x1f means this page is uncorrectable.
29	Unc	When 1, this page is uncorrectable by BCH, this page is bad.
30	Ecc	When 1, current NAND read is with ECC on.
31	Done	When 1, the information content and data read from NAND are valid, otherwise the "read" is not done.

### P\_NAND\_DC

Used for apb\_mode, internal NAND controller still uses DDR interface, only the DDR request and DDR grant are redirected from DDR to apb registers, this enables the host to read NAND without DDR, for ROM boot and debug.

Bit(s)	Name	Description
7:0	Dc_wr_dm	DDR write data mask, Each Bit masks one byte.
8	Dc_wr	When 1, write data from NAND to DDR. When 0, read data from DDR to NAND.
9	Dc_lbrst	When 1, the 64 Bits data is the last in current DDR burst, used with Dc_req.
10	Dc_ugt	When 1, current DDR request of read/write is urgent, in NAND controller, the Dc_ugt is set to 0, none-urgent.
11	Dc_req	When 1, the NAND controller send request to DDR to read or write data, in case of apb_mode, when dc_req is "1", the host is responsible for send to or receive from NAND controller. Note: this is the only signal the host needs to check when in apb_mode.

### P\_NAND\_ADR

32 Bits DDR address when NAND controller read or write to DDR memory, any address space within the DDR memory installed in the system is valid.

### P\_NAND\_DL

The DDR interface uses 64 Bits width bus, this register is for low 32 Bits, [31:0].

### P\_NAND\_DH

The DDR interface uses 64 Bits width bus, this register is for high 32 Bits, [63:32].

Read and write to this register will generate "grant" and "dc\_wr\_avail" or "dc\_rd\_avail".

Always read or write low 32 Bits first, then read or write to high 32 Bits and NAND controller hardware will generate "grant" and "dc\_wr\_avail" or "dc\_rd\_avail", combined with the data, the DDR address advances to next address.

NAND controller programs NAND flash in apb\_mode:

- Check P\_NAND\_DC till "dc\_req" is high.
- Write low 32 Bits to P\_NAND\_DL.
- Write high 32 Bits to P\_NAND\_DH.
- Go back to beginning till all the data is written.

NAND controller reads data from NAND flash in apb\_mode:

- Check P\_NAND\_DC till "dc\_req" is high.
- Read low 32 Bits from P\_NAND\_DL.
- Read high 32 Bits from P\_NAND\_DH.
- Go back to beginning till all the data is read.

Since the DDR interface in NAND controller process the data in group of 16 double words (64 Bits), the software can only check "dc\_req" at the beginning of each 16 double words.

### P\_NAND\_CADR

Set command queue memory address, 32 Bits, any memory location.

This address can only be programmed by APB bus.

### P\_NAND\_SADR

Set status memory location, 32 Bits, any memory location.

This address can also be programmed through command queue.

**P\_NAND\_PINS**

Bit(s)	Name	Description
13:0	Pins_len	When pins are acquired by NAND, it will use Pins_len number of NAND bus cycles before releasing pins. Default is 8.
27:14	Pins_off	When pins are released by NAND, it will wait Pins_off number of NAND bus cycles before sending next request. Default is 2.
31	Not shared	When 1 the pins is not shared, default is 0, pins are shared.

Confidential for Version!

## 13.3 eMMC/SD

### 13.3.1 Overview

A311D has the following features of eMMC/SD

- Supports SDSC/SDHC/SDXC card
- Supports eMMC and MMC card specification version 5.0 up to HS200 with data content DES crypto
- 1 bit, 4 Bits, 8 Bits date lines supported (8 Bits only for MMC)
- Descriptor chain architecture, timing tuning and adjustment
- Supports descriptor-based internal DMA controller

This module uses eMMC/SD CONTROLLERs to connect varied SD/MMC Card, or eMMC protocol compatible memory with high throughput.

### 13.3.2 PinDescription

Table 13-2 PinDescription of eMMC/SD/SDIO Module

Name	Type	Description	Speed (MHz)
CLK	Output	SD eMMC clock, 0~200MHz	200
DS	Reserverd	-	-
DAT[7:0]	SD Card 4 Bits, eMMC 8 Bits Input/Output/Push-Pull Internal pull-up for pins not used	Data, 1,4,8 mode	200
CMD	Input/Output/Push-Pull/Open-Drain Open-drain for initialization Push-pull for fast command transfer ROD is connected when in open-drain mode.	Command Response	100
Rst_n	eMMC required	Hardware reset	Low
IRQ	SD Card or eMMC not used.	Device interrupt can be replaced by DAT[1]	Low

### 13.3.3 eMMC/SD Mode

**eMMC Mode:**

Table 13-3 eMMC Mode

Mode Name	Data Rate	IO Voltage	Bus Width	Frequency	Max Data Transfer
Legacy MMC card	Single	3/1.8V	1, 4, 8	0-26MHz	26MB/s
High Speed SDR	Single	3/1.8V	1,4, 8	0-52MHz	52MB/s
High Speed DDR	Dual	3/1.8V	4, 8	0-52MHz	104MB/s

Mode Name	Data Rate	IO Voltage	Bus Width	Frequency	Max Data Transfer
HS200	Single	1.8V	4, 8	0-200MHz	200MB/s

The HS200 mode offers the following features:

- SDR Data sampling method
- CLK frequency up to 200MHz Data rate – up to 200MB/s
- 4 or 8-bits bus width supported
- Signaling levels of 1.8V
- Tuning concept for Read Operations

#### SD Mode:

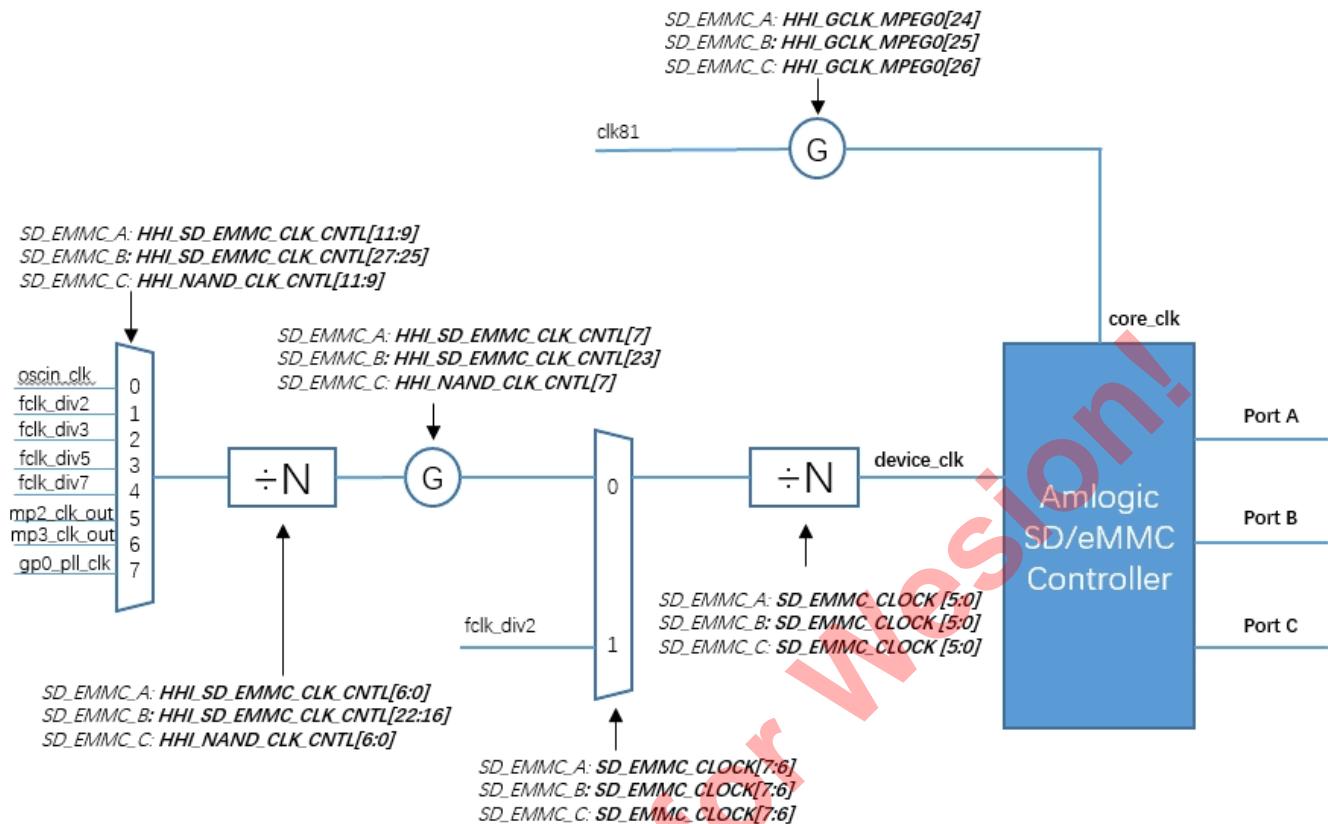

**Table 13-4 SD Mode**

Mode Name	Data Rate	IO Voltage	Bus Width	Frequency	Max Data Transfer
Default Speed	Single	3.3V	1, 4	0-25MHz	12.5MB/s
High Speed	Single	3.3V	1, 4	0-50MHz	25MB/s
SDR12	Single	1.8V	1,4	0-25MHz	12.5MB/s
SDR25	Single	1.8V	1,4	0-50MHz	25MB/s
SDR50	Single	1.8V	1,4	0-100MHz	50MB/s
SDR104 (highest)	Single	1.8V	1,4	0-208MHz	104MB/s
DDR50	Dual	1.8V	4	0-50MHz	50MB/s

#### 13.3.4 Clock

In A311D, clock source has the options to select from the figure below.

Figure 13-2 EMMC Clock Diagram

### 13.3.5 Descriptor

#### 13.3.5.1 Descriptor Structure

The descriptor has a size of 4x32 Bits.

Table 13-5 Descriptor Structure

byte	7	6	5	4	3	2	1	0						
0	length[7:0]													
1	Timeout 4 Bits				End of chain	R1b	block mode	length[8]						
2	data num	resp num	resp 128	resp nocrc	Data wr	Data io	No cmd	No resp						
3	owner	error	cmd index 6 Bits											
4	cmd argument 32 Bits													
5														
6														
7														
8	data address 32 Bits or data 0-4 bytes													
9	[1]Big Endian, [0]SRAM													

byte	7	6	5	4	3	2	1	0
10								
11								
12								
13	response address 32 Bits or response irq en							
14	[0]SRAM							
15								

### 13.3.5.2 Descriptor Definition

Table 13-6 Descriptor Definition

Name	Bits	Description
Length	Cmd_cfg[8:0]	same as spec, copy the content from command argument into this field, different byte size and 512 bytes, different number of blocks. If the command is operating on bytes, block mode = 0, this field contains the number of bytes to read or write, A value of 0 shall cause 512 bytes to be read to written, if the command is operating on blocks, block mode = 1, this field contains the number of blocks, a value of 0 is infinite number of blocks.
Block_mode	Cmd_cfg[9]	1: the read or write shall be performed on block basis. The block size is from SD/eMMC device, and saved in APB3 register in module. 0: the read or write is byte based.
R1b	Cmd_cfg[10]	1: check the DAT0 busy after received response R1 0: do not check the DAT0 busy state.
End_of_chain	Cmd_cfg[11]	1: it is the end of descriptor chain, the host stops and issues IRQ after this descriptor is done. 0: the host reads next descriptor and continues. The command chain execution is started by write an APB3 register and stopped by the "end of chain" or clear a APB3 start register, or found one descriptor with owner is set to 0.
Timeout	Cmd_cfg[15:12]	2timeout ms when timeout != 0, max timeout 32.768s, when over the timeout limit, error bit is set, IRQ is issued. When timeout is 0, no time limit.
No_resp	Cmd_cfg[16]	1: this command doesn't have response, used with command doesn't have response. 0: there is a response. The module waits for response, the response timeout setting is in APB3 register.
No_cmd	Cmd_cfg[17]	1: this descriptor doesn't have command in it, it does data DMA only, used with command to read or write SD/eMMC with data from multiple locations.
Data_io	Cmd_cfg[18]	1: there is data action in this descriptor, used with command have data process. 0: there is no data read/write action.

Name	Bits	Description
Data_wr	Cmd_cfg[19]	1: host writes data to SD/eMMC 0: host read data from SD/eMMC
Resp_nocrc	Cmd_cfg[20]	1: R3 response doesn't have CRC. 0: host does CRC check.
Resp_128	Cmd_cfg[21]	1: R3 response with 128 Bits information. 0: 32 Bits responses.
Resp_num	Cmd_cfg[22]	1: the resp_addr is the IRQ enable Bits, used to check the response error status, when there is an error, IRQ[14] is issued, the first 4 bytes of response is saved into resp_addr. 0: save response into SRAM or DDR location.
Data_num	Cmd_cfg[23]	1: save 4 bytes of data back into descriptor itself at bytes 8~11.
Cmd_index	Cmd_cfg[29:24]	The SD/eMMC command index. Desc REG wr: 4 reg44, 12 reg4c.
Error	Cmd_cfg[30]	Write back by host. The combined error from command, response, data, includes CRC error and timeout. When it is set the descriptor execution is stopped and an IRQ is issued. The CPU can read SD_EMMC_STATUS register to get detail information.
Owner	Cmd_cfg[31]	Programmed by CPU to 1, cleared by host to 0. 1: the descriptor is valid and owned by host, after it is done, even it has error, the owner bit is cleared, the descriptor is owned by CPU. In case of descriptor chain execution when host found a descriptor with "0" owner bit, it will stop.
Cmd_arg	Desc 4~7 bytes	32 Bits. The actual command argument some of the previous fields are copied from this command argument, the software need to make sure they are consistent. Desc REG wr: new value Data_addr: write mask, 1: change, 0: no change.
Data_addr	Desc 8~11 bytes	32 Bits. If the data_num is 0, the content is data address. If the data_num is 1, the content is 4 data bytes. When it is an address: Data_addr[0]: 1: SRAM address, 0: DDR address. If the data_addr[31:12] matches with SD_EMMC_BASE, it is SRAM address. Data_addr[1]: 1: 4 bytes big endian, 0: little endian(default).

Name	Bits	Description
Resp_addr	Desc 12~15 bytes	<p>32 Bits</p> <p>If the resp_num is 0, the content is resp address.</p> <p>If the resp_num is 1, before execution, it is the response IRQ enable Bits, after execution, it is the first 4 response bytes.</p> <p>When it is an address:</p> <p>Resp_addr[0]:</p> <p>1: SRAM address, 0: DDR address.</p> <p>If the resp_addr[31:12] matches with SD_EMMC_BASE, it is SRAM address.</p>

### 13.3.6 RegisterDescription

Each register final address = module base address+ address \* 4

Where module address addresses are 0xFFE07000 for portB(eMMC), 0xFFE05000 for port C (eMMC).

#### SD\_EMMC\_CLOCK 0x0

Bit(s)	R/W	Default	Description
30	R/W	0	Cfg_irq_sdio_sleep_ds : 1: select DS as IRQ source during sleep.
29	R/W	0	Cfg_irq_sdio_sleep: 1: enable IRQ sdio when in sleep mode. When DAT1 IRQ, the controller uses PCLK to detect DAT1 level and starts core clock, the core initials IRQ_period and detect DAT1 IRQ.
28	R/W	0	Cfg_always_on: 1: Keep clock always on 0: Clock on/off controlled by activities. Any APB3 access or descriptor execution will turn clock on. Recommended value: 0
27:22	R/W	0	Cfg_rx_delay: RX clock delay line, 6 bits 0: no delay, n: delay n*50ps Maximum delay 3150ps.
21:16	R/W	0	Cfg_tx_delay: TX clock delay line, 6 bits 0: no delay, n: delay n*50ps Maximum delay 63*50ps =3150ps.
15:14	R/W	0	Cfg_sram_pd: Sram power down
13:12			Cfg_rx_phase: RX clock phase 0: 0 phase, 1: 90 phase, 2: 180 phase, 3: 270 phase. Recommended value: 0

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11:10	R/W	0	Cfg_tx_phase: TX clock phase 0: 0 phase, 1: 90 phase, 2: 180 phase, 3: 270 phase. Recommended value: 2
9:8	R/W	0	Cfg_co_phase: Core clock phase 0: 0 phase, 1: 90 phase, 2: 180 phase, 3: 270 phase. Recommended value: 2
7:6	R/W	0	Cfg_src: Clock source 0: Crystal 24MHz or other frequencies selected by clock reset test control register. 1: Fix PLL, 1000MHz Recommended value: 1
5:0	R/W	0	Cfg_div: Clock divider Frequency = clock source/cfg_div Clock off: cfg_div==0, the clock is disabled Divider bypass: cfg_div==1, clock source is used as core clock without divider Maximum divider 63.

**SD\_EMMC\_DELAY1 0x4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0	Reserved.
29:24	R/W	0	Dly[4]: Data 4 delay line
23:18	R/W	0	Dly[3]: Data 3 delay line
17:12	R/W	0	Dly[2]: Data 2 delay line
11:6	R/W	0	Dly[1]: Data 1 delay line
5:0	R/W	0	Dly[0]: Data 0 delay line Total delay = 50ps * Dly When Dly == 0, no delay. When Dly ==63, 3150ps delay. NOTE: the 50ps is typical delay, actually delay may vary from chip to chip, from different temperature.

**SD\_EMMC\_DELAY2 0x8**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30			Reserved.
29:24			Dly[9]: Data 9 delay line
23:18			Dly[8]: Data 8 delay line
17:12			Dly[7]: Data 7 delay line

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11:6			Dly[6]: Data 6 delay line
5:0			<p>Dly[5]: Data 5 delay line            Total delay = 50ps * Dly            When Dly == 0, no delay.            When Dly == 63, 3150ps delay.</p> <p>NOTE: the 50ps is typical delay, actually delay may vary from chip to chip, from different temperature.</p>

**SD\_EMMC\_ADJUST      0xC**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:23			Unused
22	R/W	0	<p>Adj_auto            1: Use cali_dut's first falling edge to adjust the timing, set cali_enable to 1 to use this function, simulation shows it can tracking 2.5ns range with 800ppm.            0: disable            Working for HS200 mode, set Cali_enable to 1.            Enhanced after gxlx project.            Use RESP and DAT0 as reference, Separate RESP and DAT0, adjust the timing whenever there is a transition, insert a sample when there is no transition.</p>
21:16	R/W	0	Adj_delay: Resample the input signals when clock index==adj_delay
15	R/W	0	Reserved
14	R/W	0	<p>Cali_rise:            1: test the rising edge, recording rising edge location only.            0: test the falling edge</p>
13	R/W	0	<p>Adj_fixed:            Adjust interface timing by resampling the input signals</p>
12	R/W	0	<p>Cali_enable:            1: Enable calibration            0: shut off to save power.</p>
11:8	R/W	0	<p>Cali_sel: Select one signal to be tested            Signals are labeled from 0 to 9 the same as delay lines.            Only one signal is tested at anytime.            For example:            Cali_sel == 9, test CMD line.</p>

**SD\_EMMC\_CALOUT      0x10**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:16			Unused

15:8	R		Cali_setup
7	R		Cali_vld: The reading is valid When there is no rising edge or falling edge event, the valid is low, this reading is not valid.
5:0	R		Cali_idx: The event happens at this index, The index starts from rising edge of core clock from 0, 1, 2, ...

**SD\_EMMC\_ADJ\_IDX\_LOG 0x20**

Bit(s)	R/W	Default	Description
31:30			Current, Auto_adj mode, Current 6 bits adj_idx
29:24			Previous 1
23:18			Previous 2
17:12			Previous 3
11:6			Previous 4
5:0			Previous 5: Last two bits of previous 5

**SD\_EMMC\_CLKTEST\_LOG 0x24**

Bit(s)	R/W	Default	Description
31			Clktest_done, Test done
30:0			Clktest_times, Test clock core for $2^{\text{Clktest\_exp}}$

**SD\_EMMC\_CLKTEST\_OUT 0x28**

Bit(s)	R/W	Default	Description
31:0			Clktest_out, All $2^{\text{clktest\_exp}}$ test results add up. Note: divided by $2^{\text{clktest\_exp}}$ and get average clock core period length measured by 50ps delay cells.

**SD\_EMMC\_EYETEST\_LOG 0x2c**

Bit(s)	R/W	Default	Description
31			eyetest_done, Test done
30:0			eyetest_times, Test eye for $2^{\text{eyetest\_exp}}$

**SD\_EMMC\_EYETEST\_OUT0 0x30**

Bit(s)	R/W	Default	Description
31:0			All $2^{\text{eyetest\_exp}}$ test results "OR" together.

**SD\_EMMC\_EYETEST\_OUT1 0x34**

Bit(s)	R/W	Default	Description
31:0			

31:0			<p>eyetest_out1, All 2^eyetest_exp test results "OR" together.</p> <p>Total eyeout [62:0] = {Eyetest_out1[30:0], eyetest_out0[31:0]}</p> <p>EYetest output changed to 64 bits after TXLX and A113</p> <p>{eyetest_out1, eyetest_out0}</p>
------	--	--	---

**SD\_EMMC\_INTF3      0x38**

Bit(s)	R/W	Default	Description
26			<p>Eyetest_sel, 0 : select core clock as eyetest clock. 1 : select DS after delay line as eyetest clock. Eyetest point is DS after delay line.</p>
25:23			NAND_EDO, NAND Async interface EDO position after RE rising edge. [not for SD_eMMC]
22			Sd_intf3, Using SD interface 3
21:18			<p>Ds_sht_exp, 0: DS shift setting never expires, always using the DS_sht_m as shift length. None-zero: 2^ds_sht_exp after 2^ds_sht_exp "ms", the setting expired The internal FSM will automatically change the DS shift setting.</p>
17:12			<p>Ds_sht_m, Shift DS by number of 50ps delay cells. If using auto FSM mode, it is the initial value.</p>
11			<p>Eyetest_on, 1: Turn on eye test After eyetest_done, set this bit to 0 to reset eyetest internal registers.</p>
10:6			<p>Eyetest_exp, Repeat the eye test for 2^eyetest_exp times, Or the test results together, report the final results.</p>
5			Clktest_on_m, Manual turn on clock test
4:0			<p>Clktest_exp, Repeat the clock test for 2^clktest_exp times. Add the clock length together, report the sum.</p>

**SD\_EMMC\_START      0x40**

Bit(s)	R/W	Default	Description
31:2	R/W	0	<p>Desc_addr[31:2]: Descriptor address, the last 2 Bits are 0, SRAM: 4 bytes aligned, the valid address range is from 0x200~0x3ff DDR: 8 bytes aligned the valid address is anywhere in DDR, the length of chain is unlimited. Desc_addr = ADDR&gt;&gt;2.</p>

1	R/W	0	<p>Desc_busy: Start/Stop 1: Start command chain execution process. 0: Stop</p> <p>Write 1 to this register starts execution. Write 0 to this register stops execution.</p>
0	R/W	0	<p>Desc_int: SRAM/DDR 1: Read descriptor from internal SRAM, limited to 32 descriptors. 0: Read descriptor from external DDR</p>

**SD\_EMMC\_CFG 0x44**

Bit(s)	R/W	Default	Description
31:28	R/W	0	Cfg_ip_txd_adj: Data 1 interrupt, when in TXD mode, the data 1 irq is a input signal, the round trip delay is uncertain factor, change this cfg to compensate the delay.
27	R/W	0	Cfg_err_abort: 1: abort current read/write and issue IRQ 0: continue on current read/write blocks.
26	R/W	0	Cfg_irq_ds: 1: Use DS pin as SDIO IRQ input, 0: Use DAT1 pin as SDIO IRQ input.
25	R/W	0	Cfg_txd_retry: When TXD CRC error, host sends the block again. The total number of retries of one descriptor is limited to 15, after 15 retries, the TXD_err is set to high.
24	R/W	0	Cfg_txd_addr_err: TXD add error test. Test feature, should not be used in normal condition. It will inverted the first CRC Bits of the 3rd block. Block index starts from 0, 1, 2, ...
23	R/W	0	Cfg_auto_clk: SD/eMMC Clock Control 1: when BUS is idle and no descriptor is available, automatically turn off clock, to save power. 0: whenever core clock is on the SD/eMMC clock is ON, it is still on/off during read data from SD/eMMC.
22	R/W	0	Cfg_stop_clk: SD/eMMC Clock Control 1: no clock for external SD/eMMC, used in voltage switch. 0: normal clock, the clock is automatically on/off during reading mode to back off reading in case of DDR slow response.
21	R/W	0	Cfg_cmd_low: Hold CMD as output Low eMMC boot mode.
20	R/W	0	Cfg_chk_ds

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19	R/W	0	Cfg_ignore_owner: Use this descriptor even if its owner bit is “0”.
18	R/W	0	Cfg_sdclk_always_on: 1: SD/eMMC clock is always ON 0: SD/eMMC clock is controlled by host. WARNING: Set SD/eMMC clock to always ON, host may lose data when DDR is slow.
17	R/W	0	Cfg_blk_gap_ip: 1: Enable SDIO data block gap interrupt period 0: Disabled.
16	R/W	0	Cfg_out_fall: DDR mode only The command and TXD start from rising edge. Set 1 to start from falling edge.
15:12	R/W	0	Cfg_rc_cc: Wait response-command, command-command gap before next command, 2cfg_rc_cc core clock cycles.
11:8	R/W	0	Cfg_resp_timeout: Wait response till 2cfg_resp_timeout core clock cycles. Maximum 32768 core cycles.
7:4	R/W	0	Cfg_bl_len: Block length 2cfg_bl_len, because internal buffer size is limited to 512 bytes, the cfg_bl_len <=9.
3	R/W	0	Cfg_dc_ugt: 1: DDR access urgent 0: DDR access normal
2	R/W	0	Cfg_ddr: 1: DDR mode 0: SDR mode
1:0	R/W	0	Cfg_bus_width: 0: 1 bit 1: 4 Bits 2: 8 Bits 3: 2 Bits (not supported)

**SD\_EMMC\_STATUS 0x48**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R		Core_busy: 1: core is busy, desc_busy or sd_emmc_irq or bus_fsm is not idle. 0: core is idle.
30	R		Desc_busy: 1: Desc input process is busy, more descriptors in chain. 0: no more descriptor in chain or desc_err.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
29:26	R		Bus_fsm: BUS fsm
25	R		DS: Input data strobe
24	R		CMD_i: Input response signal
23:16	R		DAT_i: Input data signals
15	R/W		IRQ_sdio: SDIO device uses DAT[1] to request IRQ
14	R/W		Resp_status: When resp_num is set to 1, the resp_addr is the response status IRQ enable Bits, if there is an error.
13	R/W		End_of_Chain: End of Chain IRQ, Normal IRQ
12	R/W		Desc_timeout: Descriptor execution time over time limit. The timeout limit is set by descriptor itself. Consider the multiple block read/write, set the proper timeout limits.
11	R/W		Resp_timeout: No response received before time limit. The timeout limit is set by cfg_resp_timeout.
10	R/W		Resp_err: Response CRC error
9	R/W		Desc_err: SD/eMMC controller doesn't own descriptor. The owner bit is "0", set cfg_ignore_owner to ignore this error.
8	R/W		Txd_err: TX data CRC error, For multiple block write, any one of blocks CRC error.
7:0	R/W		Rxd_err: RX data CRC error per wire, for multiple block read, the CRC errors are Ored together.

**SD\_EMMC\_IRQ\_EN 0x4c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:18			unused
17			Cfg_cmd_setup, 1: improve CMD setup time by half SD_CLK cycle. 0: CMD is two cycle aligned with DATA.
16	R/W	0	Cfg_secure: Data read/write with crypto DES
15	R/W	0	en_IRQ_sdio: Enable sdio interrupt.
14	R/W	0	En_resp_status: Response status error.
13	R/W	0	en_End_of_Chain: End of Chain IRQ
12	R/W	0	en_Desc_timeout: Descriptor execution time over time limit.
11	R/W	0	en_Resp_timeout: No response received before time limit.

10	R/W	0	en_Resp_err: Response CRC error
9	R/W	0	en_Desc_err: SD/eMMC controller doesn't own descriptor.
8	R/W	0	En_txd_err: TX data CRC error
7:0	R/W	0	en_Rxd_err: RX data CRC error per wire.

**Descriptor\_REG0      0x50**

Bit(s)	R/W	Default	Description
31:0	R/W		SD_EMMC_CMD_CFG APB read wait Same as descriptor first word, resp_num = 1, response saved back into descriptor only. Read from this APB will hold APB bus

**Descriptor\_REG1      0x54**

Bit(s)	R/W	Default	Description
31:0	R/W		SD_EMMC_CMD_ARG APB write start Same as descriptor second word. Write to this APB address starts execution. If the current desc is busy, it will be executed after current descriptor is done.

**Descriptor\_REG2      0x58**

Bit(s)	R/W	Default	Description
31:0	R/W		SD_EMMC_CMD_DAT : Same as descriptor third word, 32 Bits data.

**Descriptor\_REG3      0x5C**

Bit(s)	R/W	Default	Description
31:0	R/W		SD_EMMC_CMD_RSP: Write: response status IRQ enable Bits. Read: Response Bit 31:0

**Descriptor\_REG4      0x60**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_CMD_RSP1: Response bit 63:32

**Descriptor\_REG5      0x64**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_CMD_RSP2: Response bit 95:64

**Descriptor\_REG6      0x68**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_CMD_RSP3: Response bit 127:96

**Descriptor\_REG7      0x6c**

Bit(s)	R/W	Default	Description
31:0			Reserved

**Current\_Next\_Descriptor\_REG0      0x70**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_CURR_CFG: Current descriptor under execution.

**Current\_Next\_Descriptor\_REG1      0x74**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_CURR_ARG

**Current\_Next\_Descriptor\_REG2      0x78**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_CURR_DAT

**Current\_Next\_Descriptor\_REG3      0x7c**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_CURR_RSP

**Current\_Next\_Descriptor\_REG4      0x80**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_NEXT_CFG: Next descriptor waiting for execution, already read out from SRAM or DDR, can't be changed.

**Current\_Next\_Descriptor\_REG5      0x84**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_NEXT_ARG

**Current\_Next\_Descriptor\_REG6      0x88**

Bit(s)	R/W	Default	Description
31:0	R		SD_EMMC_NEXT_DAT

**Current\_Next\_Descriptor\_REG7 0x8c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R		SD_EMMC_NEXT_RSP

**SD\_EMMC\_RXD 0x90**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:25	R		Unused
24:16	R		Data_blk: Rxd Blocks received from BUS Tx d blocks received from DDR.
15:10			unused
9:0	R		Data_cnt: Rxd words received from BUS. Tx d words received from DDR.

**SD\_EMMC\_TXD 0x94**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:25			Unused
24:16	R		Txd_blk: Txd BUS block counter
15			unused
14:0	R		Txd_cnt: Txd BUS cycle counter

## 13.4 Serial Peripheral Interface Communication Controller

### 13.4.1 Overview

SPI Communication Controller is designed for connecting general SPI protocol compatible module. This controller allows rapid data communication with less software interrupts than conventional serial communications.

### 13.4.2 Features

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four chip selects to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 64-bit wide by 16-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Both PIO(Programming In/Out interface) and DMA(Direct Memory Access interface) supported

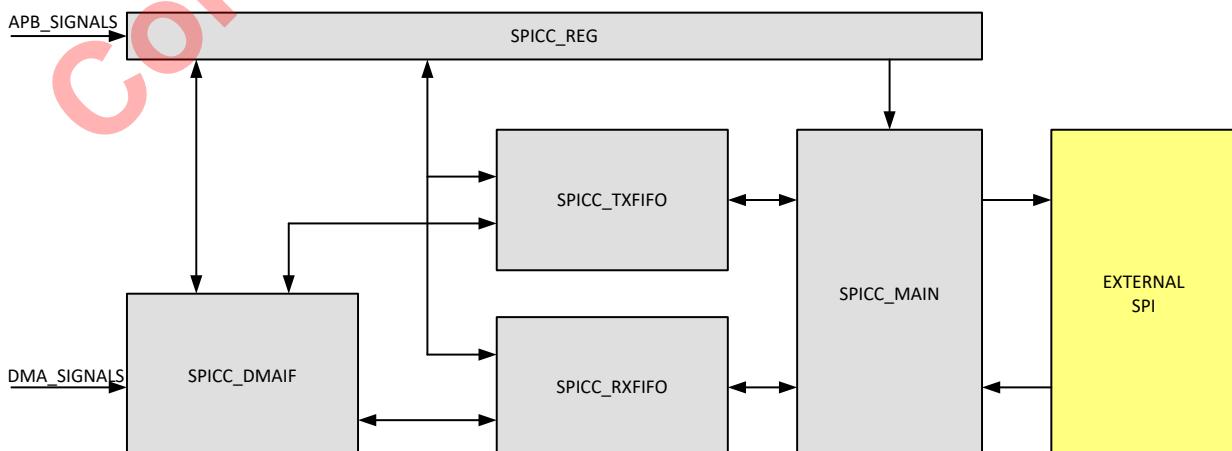

### 13.4.3 Functional Description

The following are two SPICC modes of operation:

- Master Mode—When the SPICC module is configured as a master, it uses a serial link to transfer data between the SPICC and an external device. A chip-enable signal and a clock signal are used to transfer data between these two devices. If the external device is a transmit-only device, the SPICC master's output port can be ignored and used for other purposes. To use the internal TXFIFO and RXFIFO, two auxiliary output signals, SS and SPI\_RDY, are used for data transfer rate control. The user can also program the sample period control register to a fixed data transfer rate.
- Slave Mode—When the SPICC module is configured as a slave, the user can configure the SPICC Control register to match the external SPI master's timing. In this configuration, SS becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

There are 5 sub-modules in spi communication controller, i.e. spicc\_reg, spicc\_dmaif, spicc\_txfifo, spicc\_rxfifo, and spicc\_main. Transmitting and receiving are using different channel, that means they have different buffer.

Figure 13-3 SPICC Block Diagram

- spicc\_reg is driven by host cpu, and spicc\_reg is responsible for configuring other modules.

- spicc\_dmaif is responsible for dealing with DMA operations.
- spicc\_txfifo contains a transmission FIFO.
- spicc\_rxfifo contains a receiving FIFO.
- spicc\_main is responsible for main control of basic spi operation.

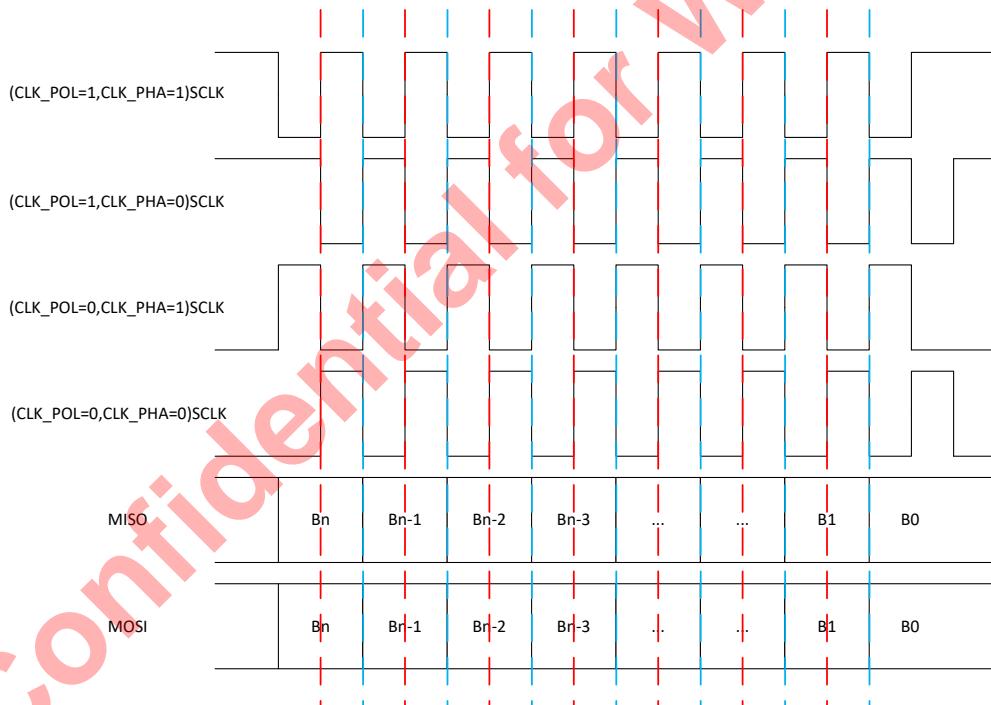

Here are SPI External Signals:

**Table 13-7 SPI External Signals**

Signal Name	I/O	Description
spicc_sclk	IO	SCLK, SPI Clock
spicc_miso	IO	MISO, Master Input Slave Output
spicc_mosi	IO	MOSI, Master Output Slave In
spicc_ss[3:0]	IO	SS, SPI chip Select, Supports up to 4 slaves.

And here is SPI Generic Timing:

**Figure 13-4 SPI Generic Timing**

#### 13.4.4 Register Description

**RXDATA**      **0xffd13000**

Bit(s)	R/W	Default	Description
31:0	R	0	Rx Data

Note1: when PIO mode, programmer can get data from this register.

**TXDATA 0xffd13004**

Bit(s)	R/W	Default	Description
31:0	W	0	Tx Data

Note1: when PIO mode, programmer need send data to this register.

**CONREG 0xffd13008**

Bit(s)	R/W	Default	Description
31:19	RW	0	[13]burst_length ([5:0]bit number of one word/package, [12:6]burst length-1)
18:16	RW	0	[ 3]data_rate (sclk will be divided by system clock with equation: $2^{(data\_rate+2)}$ , Example: if system clock = 128MHz and data_rate=2, sclk's frequency equals 8MHz)
15:14			Reserved
13:12	RW	0	[ 2]chip_select (00:select ss_0, 01:select ss_1, 10:select ss_2, 11:select ss_3,)
11:10			Reserved
9:8	RW	0	[ 2]drctl (0:ignore RDY input, 1:Data ready using pin rdyl_i's failing edge, 2:Data ready using pin rdyl_i's low level, 3:reserved)
7	RW	0	[ 1]sspol (0:SS polarity Low active,1:High active)
6	RW	0	[ 1]ssctl (see details in Note1)
5	RW	0	[ 1]pha (clock/data phase control, see section 2.2)
4	RW	0	[ 1]pol (clock polarity control, see section 2.2)
3	RW	0	[ 1]smc (start mode control, see Note2)
2	RW	0	[ 1]xch(exchange bit, ATTN:will automatically cleared when burst finished, see Note3)

Bit(s)	R/W	Default	Description
1	RW	0	[ 1]mode (0:slave,1:master)
0	RW	0	[ 1]en (0:spicc disable,1:enable)

Note1: In one burst of master mode, if ssctl ==1, ss will output 1 between each spi transition. And if ssctl ==0, ss will output 0.

Note2: smc is for start mode control. If smc ==0, burst will start when xch is set to 1'b1; if smc==1, burst will start when txfifo is not empty.

Note3: setting xch will issue a burst when smc==0, and This bit will be self-cleared after burst is finished.

#### INTREG 0xffd1300c

Bit(s)	R/W	Default	Description
31:8			Reserved
7	RW	0	[ 1]tcen(transfer completed interrupt enable)
6	RW	0	Reserved
5	RW	0	[ 1]rfen(rx fifo full interrupt enable)
4	RW	0	Reserved
3	RW	0	[ 1]rren(rx fifo ready interrupt enable)
2	RW	0	[ 1]tfen(tx fifo full interrupt enable)
1	RW	0	Reserved
0	RW	0	[ 1]teen(tx fifo empty interrupt enable)

Note1: Interrupt Status presents in STATREG.

#### DMAREG 0xffd13010

Bit(s)	R/W	Default	Description
31:26	RW	0	[ 6]DMA Burst Number
25:20	RW	0	[ 6]DMA Thread ID
19	RW	0	[ 1]DMA Urgent
18:15	RW	0x7	[ 4]Number in one Write request burst(0:1,1:2...)
14:11	RW	0x7	[ 4]Number in one Read request burst(0:1,1:2...)
10:6	RW	0x8	[ 5]Rx FIFO threshold(RxFIFO's count>=thres, will request write)
5:1	RW	0	[ 5]Tx FIFO threshold(TxFIFO's count<=thres, will request read)

0	RW	0	[ 1]DMA Enable
---	----	---	----------------

**STATREG 0xffd13014**

Bits	R/W	Defaults	Description
31:8			Reserved
7	RW	0	[ 1]tc(transfer completed, w1c, see Note1)
6	R	0	Reserved
5	R	0	[ 1]rf(rx fifo full)
4	R	0	Reserved
3	R	0	[ 1]rr(rx fifo ready)
2	R	0	[ 1]tf(tx fifo full)
1	R	0	Reserved
0	R	0	[ 1]te(tx fifo empty)

Note1: tc is the status bit which indicates a burst transfer is completed. And a burst transfer should be started by writing xch 1'b1. This bit supports w1c(Write 1 clear).

**PERIODREG 0xffd13018**

Bit(s)	R/W	Default	Description
31:15			Reserved
14:0	RW	0	[15]period(wait cycles, see Note1)

Note1: Programmer can add wait cycles through this register if transmission rate need to be controlled.

**TESTREG 0xffd1301c**

Bit(s)	R/W	Default	Description
31:23	RW	0	Reserved
23:22	RW	0	[ 2]fiforst(fifo soft reset)
21:16	RW	0x15	[ 6]dlyctl(delay control)
15	RW	0	[ 1]swap(data swap for reading rx fifo)
14	RW	0	[ 1]lbc(loop back control)
12:10	R	0	[ 3]smstatus(internal state machine status)
9:5	R	0	[ 5]rxcnt(internal Rx FIFO counter)
4:0	R	0	[ 5]txcnt(internal Tx FIFO counter)

Note1: Programmer can only use the TESTREG[9:0], rxcnt(internal Rx FIFO counter) and txcnt(internal Tx FIFO counter), and other Bits just for test.

**DRAADDR 0xffd13020**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	Read Address of DMA

**DWADDR 0xffd13024**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	RW	0	Write Address of DMA

**LD\_CNTL0 (0xffd13028)**

<b>Bits</b>	<b>R/W</b>	<b>Defaults</b>	<b>Description</b>
31:9	RW	0	Reserved
8	RW	0	dma raddr/waddr load by dma_enable signal
7	RW	0	dma waddr load by vsync irq
6	RW	0	dma raddr load by vsync irq
5	RW	0	dma write counter enable
4	RW	0	dma read counter enable
3	RW	0	xch enable set by vsync irq
2	RW	0	dma enable set by vsync irq
1	RW	0	Reserved
0	RW	0	Vsync irq source select

**LD\_CNTL1 0xffd1302c**

<b>Bits</b>	<b>R/W</b>	<b>Defaults</b>	<b>Description</b>
31:16	RW	0	dma write counter
15:0	RW	0	dma read counter

**LD\_RADDR 0xffd13030**

<b>Bits</b>	<b>R/W</b>	<b>Defaults</b>	<b>Description</b>
31:0	RW	0	shadow dma read address for load

**LD\_WADDR 0xffd13034**

<b>Bits</b>	<b>R/W</b>	<b>Defaults</b>	<b>Description</b>
31:0	RW	0	shadow dma write address for load

**ENHANCE\_CNTL 0xffd13038**

<b>Bits</b>	<b>R/W</b>	<b>Defaults</b>	<b>Description</b>
31:30	R	0	Reserved
29	R/W	0	main clock always on
28	R/W	0	clk-cs delay enable
27	R/W	0	cs_oen enhance enable
26	R/W	0	clk_oen enhance enable
25	R/W	0	mosi_oen enhance enable
			spi clk select 0: controlled by data_rate in CONREG 1: controlled by enhance_clk_div in ENHANCE_CNTL
24	R/W	0	
23:16	R/W	0	enhance_clk_div
15:0	R/W	0	clk-cs delay value

**ENHANCE\_CNTL1 (0xffd1303c)**

<b>Bits</b>	<b>R/W</b>	<b>Defaults</b>	<b>Description</b>
31:29	R/W	0	enhance_fclk_mosi_oen_dlyctl: mosi_oen delay control in fclk
28	R/W	0	enhance_fclk_mosi_oen_dlyctl_en: enable dlyctl
27:25	R/W	0	enhance_fclk_mosi_o_dlyctl: mosi_o delay control in fclk
24	R/W	0	enhance_fclk_mosi_o_dlyctl_en: enable dlyctl
23:21	R/W	0	enhance_fclk_miso_i_dlyctl: miso_i delay control in fclk
20	R/W	0	enhance_fclk_miso_i_dlyctl_en: enable dlyctl
19:17	R/W	0	enhance_fclk_mosi_i_dlyctl: mosi_i delay control in fclk
16	R/W	0	enhance_fclk_mosi_i_dlyctl_en: enable dlyctl
15	R/W	0	enhance_fclk_en: fclk gate enable
14	R/W	0	enhance_mosi_i_capture_en: enable, 1=select enhance capture function for mosi_i (slave mode)
9:1	R/W	0	enhance_clk_tcnt: adjust capturing timing for miso_i data (master mode). when clk_cnt=enhance_clk_tcnt, capture input data. the value of enhance_clk_tcnt must be less than the most value of clk_cnt. sclk will be divided by system clock with clk_cnt.
0	R/W	0	enhance_miso_i_capture_en: enable, 1=select enhance capture function for miso_i (master mode)

**ENHANCE\_CNTL2 0xffd13040**

<b>Bits</b>	<b>R/W</b>	<b>Defaults</b>	<b>Description</b>

31	R/W	0	clk_cs_tt delay enable
30:16	R/W	0	clk_cs_tt delay value
15	R/W	0	clk_cs_ti delay enable
14:0	R/W	0	clk_cs_ti delay value

**SPICC1: 0ffd15000~0ffd15038**

## 13.5 Serial Peripheral Interface Flash Controller

### 13.5.1 Overview

SPI Flash Controller is designed for connecting varied SPI Flash memory.

### 13.5.2 Features

- Support three operation modes, NOR Flash mode, Master mode, and Slave mode.
- Support read/write buffer up to 64bytes.
- Support no clock toggling during DUMMY state.
- Support hold by an external pin during a transition.
- AHB read support byte and halfword.
- Support bit-number rather than byte-number for each stage.
- Support 2/4 wire writing like fast reading
- Support both rising-edge and falling-edge for SPI slave sampling and SPI master sampling.
- Support 1 wire for SPI\_D and SPI\_Q.
- Support SPI\_CK setup and hold time by cycles
- Support 8 bit clock divider, so SPI\_CK can be low as 1/256 HCLK
- Support byte-order in a word
- Support no command state, so the command is sent/received in address state by 2/4 wires.
- Support both data input and data output in a transition. SPI\_DOUT->(SPI\_DUMMY)->SPI\_DIN

### 13.5.3 Register Description

Note that: If the bit2 “Backward Compatible” in “SPI User Register” is 1, the registers and functions of this SPI controller are as same as Apollo SPI controller.

To use SPI Flash commands, please set the bit2 “Backward Compatible” in “SPI User Register” as “1”.

**SPI FLASH Command register      0ffd14000**

Bit(s)	R/W	Default	Description
31	R/W	0	READ command. 1 = read. When it becomes 0, the read command is finished. The READ command could be (0xEB, 0x6B, 0xBB, 0x3B, 0x0B, 0x03). By default is 0x0B. One read command will read 1336erilog133613361336 32x8bits data. And saved in data cache.
30	R/W	0	WREN command. (0x06)
29	R/W	0	WRDI command. ( 0x04).
28	R/W	0	RDID command. (0x9f).
27	R/W	0	RDSR command. (0x05).
26	R/W	0	WRSR command. (0x01).
25	R/W	0	Page program command. (0xAD or 0x02).
24	R/W	0	SE command (0x20).
23	R/W	0	BE command ( 0xD8).

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
22	R/W	0	CE command.(0xC7).
21	R/W	0	Deep Power Down command(0xB9).
20	R/W	0	RES command. (0xAB).
19	R/W	0	HPM command.(0xA3). (Just For winbond SPI flash).
18	R/W	0	USER defined command.
17:0	R/W	0	Reserved for future.

If the bit2 “Backward Compatible” in “SPI User Register” is 1, the bit15:0 of this registers are defined as same as Apollo SPI controller.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
15	R/W	0	USER command address bit. 1 = user command includes address. 0 = no address.
14	R/W	0	USER command dummy bit. 1= user command includes Dummy bytes.
13	R/W	0	USER command DIN bit. 1 = use command includes data in. 0 = no data in.
12	R/W	0	USER command DO bit. 1 -- use command includes data output. 0 = no data output. Only DIN or DO support for one User command. Not both.
11:10	R/W	0	User command dummy byte number. How many dummy bytes for user command.
9:8	R/W	0	Reserved for future.
7:0	R/W	0	command value for User command bit[7:0].

#### SPI address register      0xffd14004

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	The address[31:0] of the user command

If the bit2 “Backward Compatible” in “SPI User Register” is 1, the bit15:0 of this registers are defined as same as Apollo SPI controller.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:30	R/W	0	Reserved.
29:24	R/W	0	DIN/DO data bytes number.
23:0	R/W	0	24 bits address.

#### SPI control register      0xffd14008

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:27	R/W	0	Reserved.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26	R/W	0	Write bit order. 1 = 0, 1, 2, 3, 4, 5, 6, 7. 0 = 7, 6, 5, 4, 3, 2, 1, 0.
25	R/W	0	Read bit order. . 1 = 0, 1, 2, 3, 4, 5, 6, 7. 0 = 7, 6, 5, 4, 3, 2, 1, 0.
24	R/W	0	Fast read QIO mode.
23	R/W	0	Fast read DIO mode.
22	R/W	0	Write 2 bytes status mode. For some of winbond SPI flash, the status register is 16bits.
21	R/W	1	SPI flash WP pin value if use SPI flash WP pin as write protection.
20	R/W	0	Fast read QOUT mode.
19	R/W	1	1 = SPI share pins with SDRAM. 0 = doesn't share.
18	R/W	0	SPI hold mode. 1=SPI controller would use SPI hold function. 0 = SPI controller won't use hold function. The SPI flash hold pin can be tie high on the board. Or SPI controller can use hold pin as QIO/QOUT mode.
17	R/W	1	1 = enable AHB request. 0 = disable AHB request when you reconfigure SPI controller or running APB bus commands.
16	R/W	0	1 =enable SST SPI Flash aai command. The APB bus PP command will send AAI command.
15	R/W	1	1 = release from Deep Power-Down command is with read electronic signature.
14	R/W	0	Fast read DOUT mode.
13	R/W	1	Fast read mode. AHB bus read requirement and APB bus read command use the command 0x0Bh.
12:0	R/W	0	Reserved for future.

If the bit2 "Backward Compatible" in "SPI User Register" is 1, the bit12:0 of this registers are defined as same as Apollo SPI controller.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12	R/W	1	1=SPI clock frequency is same as system clock. 0 = SPI clock frequency will use clock divider.
11:8	R/W	0	Clock counter for clock divider.
7:4	R/W	0	Clock high counter.
3:0	R/W	0	Clock low counter. If the SPI clock frequncy = sys_clock_frequency / n. Then the clock divider counter = n - 1; the clock high counter = n /2 - 1; the clock low counter = n- 1; For example, if you want to SPI clock 1338erilog13381338 is divided by 2 of the system clock. The clock divider counter = 1, clock high counter = 0, clock low counter = 1. For SPI clock frequency = system clock / 4.

Bit(s)	R/W	Default	Description
			The clock divider counter = 3, clock high counter = 1, clock low counter = 3.

**SPI control register 1****0ffd1400c**

Bit(s)	R/W	Default	Description
31:28	R/W	5	SPI Clock cycles for SPI flash timing requirement tCSH.
27:16	R/W	0fff	SPI Clock cycles for SPI flash timing requirement tRES.
15:0	R/W	0x0120	System clock cycles for SPI bus timer. In SPI share bus and SPI hold function mode. SPI bus timer used , if SPI use the bus for a limit time, SPI controller will diassert SPI hold pin to halt the SPI Flash, and give the bus control to SDRAM.

**SPI status register****0ffd14010**

Bit(s)	R/W	Default	Description
31:24	R/W	0	Reserved.
23:16	R/W	0	For winbond SPI flash, this 8 bits used for DI <sub>0</sub> mode M7~M0,
15:0	R/W	0	SPI status register value. WRSR command will write this value to SPI flash status. RDSR or RES command will save the read result to this register.

When SPI controller in the slave mode, this register are the status for the SPI master to read out.

Bit(s)	R/W	Default	Description
31:0	R/W	0	In SPI Slave mode, the read status of the user command

**SPI control register 2****0ffd14014**

Bit(s)	R/W	Default	Description
31:28	R/W	0	Delay cycle number of SPI_CS input in SPI slave mode or SPI_CS output in SPI master mode 0= not delay, 1 = delayed by 1 cycle of system clock, 2 = delayed by 2 cycles of system clock , ...
27:26	R/W	0	delay mode of SPI_CS input in SPI slave mode or SPI_CS output in SPI master mode 0= not latched by the edges of SPI_CK 1= latched by the falling edges of SPI_CK 2 = latched by the rising edges of SPI_CK
25:23	R/W	0	Delay cycle number of SPI Data from SPI Master to SPI Slave In SPI master mode, it is for data outputs; in SPI slave mode, it is for data inputs. 0= not delay, 1 = delayed by 1 cycle of system clock, 2 = delayed by 2 cycles of system clock , ...
22:21	R/W	0	Delay mode of SPI Data from SPI Master to SPI Slave In SPI master mode, it is for data outputs; in SPI slave mode, it is for data inputs. 0= not latched by the edges of SPI_CK

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
			1= latched by the falling edges of SPI_CK 2 = latched by the rising edges of SPI_CK
20:18	R/W	0	Delay cycle number of SPI Data from SPI Slave to SPI Master. In SPI master mode, it is for data inputs; in SPI slave mode, it is for data outputs. 0= not delay, 1 = delayed by 1 cycle of system clock, 2 = delayed by 2 cycles of system clock , ...
17:16	R/W	0	Delay mode of SPI Data from SPI Slave to SPI Master. In SPI master mode, it is for data inputs; in SPI slave mode, it is for data outputs. 0= not latched by the edges of SPI_CK 1= latched by the falling edges of SPI_CK 2 = latched by the rising edges of SPI_CK
15:12	R/W	0	In SPI master mode, SPI_CK rising edge mode 4'b1000 = later by 1/4 cycle of SPI_CK 4'b1001 = later by 1/8 cycle of SPI_CK 4'b1010 = later by 1/16 cycle of SPI_CK 4'b1011 = later by 1/32 cycle of SPI_CK 4'b1100 = earlier by 1/4 cycle of SPI_CK 4'b1101 = earlier by 1/8 cycle of SPI_CK 4'b1110 = earlier by 1/16 cycle of SPI_CK 4'b1111 = earlier by 1/32 cycle of SPI_CK Others = Normal
11:8	R/W	0	In SPI master mode, SPI_CK falling edge mode 4'b1000 = later by 1/4 cycle of SPI_CK 4'b1001 = later by 1/8 cycle of SPI_CK 4'b1010 = later by 1/16 cycle of SPI_CK 4'b1011 = later by 1/32 cycle of SPI_CK 4'b1100 = earlier by 1/4 cycle of SPI_CK 4'b1101 = earlier by 1/8 cycle of SPI_CK 4'b1110 = earlier by 1/16 cycle of SPI_CK 4'b1111 = earlier by 1/32 cycle of SPI_CK Others = Normal
7:4	R/W	1	In master mode, SPI clock cycles for SPI hold timing.
3:0	R/W	1	In master mode, SPI clock cycles for SPI setup timing. SPI setup time and SPI hold time is used to configure how soon the controller can enable spi_cs_n after the controller get the bus and how long the controller still keep the bus after the spi_cs_n become to be high.

**SPI Clock register****0ffd14018**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31	R/W	1	1=SPI clock frequency is same as system clock. 0 = SPI clock frequency will use clock divider.
30:18	R/W	0	Clock counter for Pre-scale divider: 0= not pre-scale divider, 1= pre-scale divided by 2, 2= pre-scale divided by 3, ....,
17:12	R/W	0	Clock counter for clock divider.
11:6	R/W	0	Clock high counter in SPI master mode. In SPI slave mode, it is for the delay counter for the rising edges of spi_ck_i
5:0	R/W	0	Clock low counter, in SPI master mode. In SPI slave mode, it is for the delay counter for the falling edges of spi_ck_i If the SPI clock frequncy = sys_clock_frequency / n. Then the clock divider counter = n – 1; the clock high counter = n /2 – 1; the clock low counter = n– 1; For example, if you want to SPI clock 1341erilog13411341 is divided by 2 of the system clock. The clock divider counter = 1, clock high counter = 0, clock low counter = 1. For SPI clock frequency = system clock / 4. The clock divider counter = 3, clock high counter = 1, clock low counter = 3.

**SPI User register****0ffd1401c**

Bit(s)	R/W	Default	Description
31	R/W	1	USER command COMMAND bit. 1 = user command includes command. 0 = no command. If some SPI slaves may support 2/4 IO at the first cycle, clear this bit.
30	R/W	0	USER command ADDRESS bit. 1 = user command includes address. 0 = no address.
29	R/W	0	USER command DUMMY bit. 1= user command includes Dummy bytes.
28	R/W	0	USER command DIN bit. 1 = user command includes data in. 0 = no data in.
27	R/W	0	USER command DO bit. 1 = user command includes data output. 0 = no data output. If both DIN and DO are valid, SPI master is firstly in data output state and then in data input state. If all of DUMMY, DO and DIN are valid, SPI master is firstly in data output state and then in dummy state, finally in data input state.
26	R/W	0	USER command dummy idle bit. 1= no SPI clock toggling in dummy state. 0= normal
25	R/W	0	USER command highpart bit for SPI_DOUT stage. It is for data-output in spi master mode and for data-input in spi slave mode. 1 = only high half part of buffer are used. 0 = low half part or the whole 64bytes are used.
24	R/W	0	USER command highpart bit for SPI_DIN stage. It is for data-input in spi master mode and for data-output in spi slave mode. 1 = only high half part of buffer are used. 0 = low half part or the whole 64bytes are used.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23	R/W	0	User command external hold bit for prep. 1 = in prep state, SPI master controller can be hold by the external pin SPI_HOLD
22	R/W	0	User command external hold bit for command. 1 = in command state, SPI master controller can be hold by the external pin SPI_HOLD
21	R/W	0	User command external hold bit for address. 1 = in address state, SPI master controller can be hold by the external pin SPI_HOLD
20	R/W	0	User command external hold bit for dummy. 1 = in dummy state, SPI master controller can be hold by the external pin SPI_HOLD
19	R/W	0	User command external hold bit for data input. 1 = in data input state, SPI master controller can be hold by the external pin SPI_HOLD
18	R/W	0	User command external hold bit for data output. 1 = in data output state, SPI master controller can be hold by the external pin SPI_HOLD
17	R/W	1	User command external hold polarity bit. 1 = high is valid for hold, 0 = low is valid for hold.
16	R/W	0	Single DIO mode: Data output and input apply only 1 wire.
15	R/W	0	Fast write QIO mode.
14	R/W	0	Fast write DIO mode.
13	R/W	0	Fast write QOUT mode.
12	R/W	0	Fast write DOUT mode.
11	R/W	0	Write byte order. 0 = d[7:0], d[15:8], d[23:16], d[31:24]. 1 = d[31:24], d[23:16], d[15:8], d[7:0]
10	R/W	0	Read byte order. . 0 = d[7:0], d[15:8], d[23:16], d[31:24]. 1 = d[31:24], d[23:16], d[15:8], d[7:0]
9:8	R/W	0	AHB endian mode: 0= little-endian; 1= big-endian; 2~3 reserved
7	R/W	0	In SPI master mode, the clock output edge bit: 0 = SPI_CK is inverted, 1 = SPI_CK is not inverted
6	R/W	1	In SPI slave mode, the clock input edge bit: 0 = SPI_CK_I is inverted, 1 = SPI_CK_I is not inverted
5	R/W	0	SPI CS setup bit: 1 = valid in prep state
4	R/W	0	SPI CS hold bit: 1 = valid in done state
3	R/W	0	AHB-read apply the configurations of user-command, such as command value, bit-length,....
2	R/W	1	Backward Compatible: 1 = compatible to Apollo SPI This bit affect the three registers: "SPI Flash Command Register", "SPI Address Register" and "SPI Control Register"

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
1	R/W	0	AHB-read support 4byte address, when AHB-read apply the configurations of user-command. 1 = 4byte address, 0 = 3byte address
0	R/W	0	In SPI master mode, Enable bit for Data input during SPI_DOUT stage. 1 = enable; 0 = disable This bit shall not be used in 2/4wire or SIO. When this bit is 1, during SPI_DOUT stage, data input are stored into cacheline/buffer from address 0, i.e., Bit24 is not controlling the start address. The data output can be specified by bit25

**SPI User register 1****0ffd14020**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:26	R/W	0	USER command bit number for address state 0 = 1 bit, 1= 2 bits, ...
25:17	R/W	0	USER command bit number for data output state 0 = 1 bit, 1= 2 bits, ...
16:8	R/W	0	USER command bit number for data input state 0 = 1 bit, 1= 2 bits, ...
7:0	R/W	0	USER command cycle number for dummy state 0 = 1 cycle, 1= 2 cycles, ...

**SPI User register 2****0ffd14024**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:28	R/W	0	USER command bit number for command state 0 = 1 bit, 1= 2 bits, ...
27:16	R/W	0	Reserved
15:0	R/W	0	The command content of the user command

**SPI User register 3****0ffd14028**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:0	R/W	0	In SPI Master mode, the address[63:32] of the user command In SPI Slave mode, the write status of the user command

**SPI PIN register****0xffffd1402c**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	Pin swap when it is in DIN stage and SPI data input are 4wire. This feature is for Ubec Zigbee chips. 1 = swap between {spi_q, spi_d_i} and {spi_hold_i, spi_wp_i} 0 = normal
30	R/W	0	In SPI Master mode, CS keep active after a transition. 1 = enable; 0 = disable
29	R/W	0	Idle edge of SPI_CK 0 = low when it is idle 1 = high when it is idle
28:24	R/W	0	Reserved
23	R/W	0	In the SPI slave mode, spi_cs_i polarity: 1= high voltage is active 0= low voltage is active
22:21	R/W	0	In the SPI slave mode, spi_ck_i and spi_cs_i source pins 0=SPI_CK and SPI_CS pins, respectively 1=SPI_CS2 and SPI_CS1 pins, respectively 2=SPI_HOLD and SPI_WP pins, respectively
20	R/W	0	SPI_CS2 and SPI_CS1 pin function MUX 0= spi_ck and spi_cs in the SPI master mode 1= input pads for spi_ck_i and spi_cs_i, respectively, in the SPI slave mode
19	R/W	0	SPI_CK and SPI_CS pin function MUX 0= spi_ck and spi_cs in the SPI master mode 1= input pads for spi_ck_i and spi_cs_i, respectively, in the SPI slave mode
18:17	R/W	0	SPI_HOLD and SPI_WP pin function MUX 0= normal 1= spi_q and spi_d, respectively 2= spi_cs3 and spi_cs2, repectively 3= input pads for spi_ck_i and spi_cs_i, respectively, in the SPI slave mode
16	R/W	0	SPI_D and SPI_Q switch 1= SPI_D and SPI_Q pin-functions are swapped 0= normal
15:11	R/W	0	In Master mode, these are spi_ck MUX bit[4:0] for spi_cs4 (SPI_HOLD pin), spi_cs3 (SPI_WP pin), spi_cs2, spi_cs1 and spi_cs, respectively 1= this pin is spi_ck, if this pin is not idle 0= this pin is spi_cs, if this pin is not idle

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10:6	R/W	0	In Master mode, these are polarity bit[4:0] for spi_cs4 (SPI_HOLD pin), spi_cs3 (SPI_WP pin), spi_cs2, spi_cs1 and spi_cs, respectively 1= high voltage is active 0= low voltage is active
5:0	R/W	0x1E	In Master mode, these are idle bit[5:0] for SPI_CK, for spi_cs4 (SPI_HOLD pin), spi_cs3 (SPI_WP pin), spi_cs2, spi_cs1 and spi_cs, respectively 1= idle, i.e., the spi_ck signal is 0 or the spi_cs is at the inactive level 0= active if SPI controller is working

**SPI Slave register****0xffd14030**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	SPI controller SW reset: 1 = reset, 0 = none
30	R/W	0	SPI slave mode: 1 = slave, 0 = master
29	R/W	0	In SPI slave mode, the enable bit for the command of write-buffer-and-read-buffer 0= disable, 1=enable
28	R/W	0	In SPI slave mode, the enable bit for the command of write-status-and-read-status 0= disable, 1=enable
27	R/W	0	SPI slave command define enable 0=Apply the last 3bits of Flash commands and two extra command. 1=Apply the user defined command in SPI Slave register 3
26:4	R/W	0	Reserved
11:10	R/W	0	spi_cs_i recovery mode: 0= and 1= or 2= normal 3= delayed
9:5	R/W	0	Interrupt enable for bit4:0 1= enable, 0=disable
4	R/W	0	A SPI transition is done. (whatever it is in SPI master mode or SPI slave mode)
3	R/W	0	In SPI slave mode, a status write is done
2	R/W	0	In SPI slave mode, a status read is done
1	R/W	0	In SPI slave mode, a buffer write is done
0	R/W	0	In SPI slave mode, a buffer read is done

**SPI Slave register 1****0xffd14034**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:27	R/W	0	In SPI slave mode, status bit number 0 = 1 bit, 1= 2 bits, ...
26	R/W	0	In SPI slave mode, status fast read/write enable bit: 1 = enable, 0 = disable
25	R/W	0	In SPI slave mode, status read back enable bit: 1 = reading status is written status in SPI User register 3, 0 = reading status is in SPI Status register.
24:16	R/W	0	In SPI slave mode, buffer bit number 0 = 1 bit, 1= 2 bits, ...
15:10	R/W	0	In SPI slave mode, address bit number for reading buffer 0 = 1 bit, 1= 2 bits, ...
9:4	R/W	0	In SPI slave mode, address bit number for writing buffer 0 = 1 bit, 1= 2 bits, ...
3	R/W	0	In SPI slave mode, dummy enable bit for writing status 1=enable, 0=disable
2	R/W	0	In SPI slave mode, Dummy enable bit for reading status 1=enable, 0=disable
1	R/W	0	In SPI slave mode, Dummy enable bit for writing buffer 1=enable, 0=disable
0	R/W	0	In SPI slave mode, Dummy enable bit for reading buffer 1=enable, 0=disable

**SPI Slave register 2****0xffd14038**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	In SPI slave mode, Dummy cycle number for writing buffer 0 = 1 cycle, 1= 2 cycles, ...
23:16	R/W	0	In SPI slave mode, Dummy cycle number for reading buffer 0 = 1 cycle, 1= 2 cycles, ...
15:8	R/W	0	In SPI slave mode, Dummy cycle number for writing status 0 = 1 cycle, 1= 2 cycles, ...
7:0	R/W	0	In SPI slave mode, Dummy cycle number for reading status 0 = 1 cycle, 1= 2 cycles, ...

**SPI Slave register 3****0xffd1403C**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31:24	R/W	0	In SPI slave mode, Command value for writing status, when bit27 "SPI slave command define enable" in SPI Slave register is 1

23:16	R/W	0	In SPI slave mode, Command value for reading status, when bit27 "SPI slave command define enable" in SPI Slave register is 1
15:8	R/W	0	In SPI slave mode, Command value for writing buffer, when bit27 "SPI slave command define enable" in SPI Slave register is 1
7:0	R/W	0	In SPI slave mode, Command value for reading buffer, when bit27 "SPI slave command define enable" in SPI Slave register is 1

**SPI controller cache 0~7                    0ffd14040~0ffd1405c**

Bit(s)	R/W	Default	Description
31:0	R/W	0	Cache line Word 0~7. Cache is used to read data both for AHB or APB read command. Cache is also used for APB page programming etc.

**SPI controller buffer 8~15                    0ffd14060~0ffd1407c**

Bit(s)	R/W	Default	Description
31:0	R/W	0	Buffer Word 8. Buffer is used to read/write data only for APB read/write user commands.

## 14. I/O Interface

---

This part describes A311D's I/O interfaces from the following aspects:

- USB
- Ethernet
- SDIO
- Transport Interface and Transport Stream Demux
- IR Remote
- SAR ADC
- I2C
- UART
- PWM

Confidential for Version!

## 14.1 Universal Serial Bus

### 14.1.1 Overview

The chip integrates one USB XHCI OTG 2.0 ports, one USB3.0 and PCIe 2.0 combo interface up to 5Gbps, supports 2 configurations:

- 1 USB2.0 OTG + 1 USB 2.0 Host + 1 PCIe
- 1 USB2.0 OTG + 1 USB3.0 (No PCIe)

### 14.1.2 Features

The USB2.0 OTG controller features:

- Support for the following speeds: High-Speed (HS, 480-Mbps), Full-Speed (FS, 12-Mbps) and Low-Speed (LS, 1.5-Mbps) modes
- Multiple DMA/non DMA mode access support on the application side
- Supports up to 16 bidirectional endpoints, including control endpoint 0.
- Supports Session Request Protocol (SRP) and Host Negotiation Protocol (HNP)
- Supports up to 16 host channels.
- Supports ACA ID detector, refer to Amlogic USB2.0 OTG ID Detector Specification.pdf for detail

The USB2.0 Host controller features:

- Support for the following speeds: High-Speed (HS, 480-Mbps), Full-Speed (FS, 12-Mbps) and Low-Speed (LS, 1.5-Mbps) modes
- Multiple DMA/non DMA mode access support on the application side
- Supports up to 16 host channels.

The USB2.0 PHY features:

- Support for the following speeds: High-Speed (HS, 480-Mbps), Full-Speed (FS, 12-Mbps) and Low-Speed (LS, 1.5-Mbps) modes
- The USB3.0 Host controller features:
- Support for the following speed: Super-Speed, High-Speed, Full-Speed and Low-Speed
- Compliant with the xHCI specification

The USB3.0 SS PHY features:

- 5-Gbps SuperSpeed data transmission rate over 3-m USB 3 cable
- Integrated PHY includes transmitter, receiver, spread spectrum clock (SSC) generation, PLL, digital core, and electrostatic discharge (ESD) protection circuits
- Supports legacy Half-rate mode for power-saving

### 14.1.3 Register Description

Base address:

PHY 20: 0xff63\_6000.

PHY 21: 0xff63\_A000.

For the following registers, each register's final address= base address + offset \*4.

**reg32\_00      0x00**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

## 14.2 PCIE

PCIE module includes PCIE controller and PCIE PHY.

Confidential for Version!

## 14.3 Ethernet

### 14.3.1 Overview

The Ethernet MAC controller provides a complete Ethernet interface from the chip to a Reduced Gigabit Media Independent Interface(RGMII) compliant Ethernet PHY.

### 14.3.2 Ethernet MAC

#### 14.3.2.1 Features

Ethernet MAC has the following features:

- 10/100/1000 MAC 3.70a
- RGMII/RMII
- AHB 32 Bits internal bus
- RX FIFO 4KB, TX FIFO 2KB
- 2 MAC addresses
- EEE
- Power Management

#### 14.3.2.2 Register Description

##### PRG\_ETH\_REG0 0xff634540

Bit(s)	R/W	Default	Description
31	R/W	0	Set AHB to DDR interface as urgent.
30	R/W	0	RGMII mode Use RX_CLK as TX_CLK.
29-27	R/W	0	RMII & RGMII mode Select one signal from {RXDV, RXD[3:0]} to calibrate.
26	R/W	0	RMII & RGMII mode 0: test falling edge 1: test rising edge
25	R/W	0	RMII & RGMII mode Start calibration logic
24-20	R/W	0	RMII & RGMII mode 5 Bits correspondent to {RXDV, RXD[3:0]}, set to 1 will delay the data capture by 1 cycle.
19-15	R/W	0	Set bit14 to 0. RMII & RGMII mode Capture input data at clock index equal to adj_delay.
14	R/W	0	Set RXDV and RXD setup time, data is aligned with index 0. When set to 1, auto delay and skew
13	R/W	0	RMII & RGMII mode Enable data delay adjustment and calibration logic.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12	R/W	0	RMII & RGMII mode Enable TX_CLK and PHY_REF_CLK generator.
11	R/W	0	RMII mode Use inverted internal clk_rmii_i to generate 25/2.5 tx_rx_clk.
10	R/W	0	Generate 25MHz clock for PHY
9-7	R/W	0	RMII & RGMII mode, 000: invalid value. 001: mp2_clk_out is 250MHz. 010: mp2_clk_out is 500MHz. ... Mp2_clk_out is "ratio" *250MHz.
6-5	R/W	0	RGMII mode, TX_CLK related to TXD 00: clock delay 0 cycle. 01: clock delay ¼ cycle. 10: clock delay ½ cycle. 11: clock delay ¾ cycle.
4	R	0	Unused
3	R/W	0	RMII mode CLK_RMII RGMII mode RX_CLK Use inverted signal when set to 1.
2	R/W	0	Sideband Descriptor Endianness Control Function: When set high, this signal configures the DMA to transfer descriptors in reverse endianness of the data format. When low (by default), the descriptors are transferred in the same endian format as the data. This signal is sampled during active reset (including soft-reset) only and ignored after reset is de-asserted.
1	R/W	0	Sideband Data Endianness Control Function: When set high, this signal configures the DMA to transfer data in big-endian format. When low (by default), the data is transferred in little-endian format. This signal is sampled during active reset (including soft-reset) only and ignored after reset is de-asserted.
0	R/W	0	PHY Interface Select Function: These pins select one of the multiple PHY interfaces of MAC. This is sampled only during reset assertion and ignored after that. 1: internal value 001: RGMII 0: internal value 100: RMII

**PRG\_ETH\_REG1 0xff634544**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-16	R	0	Unused

15	R/W	0	The result is valid
14	R/W	0	The results is rising edge test or falling edge test.
13-11	R/W	0	The signal under test.
10	R/W	0	The Calibration logic is waiting for event.
9-5	R/W	0	The RX_CLK length in 1ns.
4-0	R/W	0	Signal switch position in 1ns.

### 14.3.3 Ethernet PHY

#### 14.3.3.1 Features

Ethernet PHY has the following features:

- Integrated IEEE 802.3/802.3u compliant 10/100Mbps Ethernet PHY
- Supporting both full and half-duplex for either 10 or 100 Mb/s data rate
- Auto MDIX capable
- Supports wake-on-LAN,
- 100Base-T support
- MII/RMII/SMII interface
- Supports auto-negotiation
- Full set of power down modes
- Interface available to 100Base-FX Fiber-PMD
- Serial Management Interface (SMI)
- Fix configurations for LED status indicators
- Supporting military temperature range -20C to 80C
- Perfect mix of analog and digital lends itself to robustness, portability, and performance
- Multiple input clock options
- Stand-alone core

#### 14.3.3.2 Register Description

##### ETH\_PHY\_DBG\_CTL0 0xFF64C000

Bit(s)	R/W	Default	Description
[7:0]	R/W	0	ETH digital debug registers

##### ETH\_PHY\_DBG\_CTL1 0xFF64C004

Bit(s)	R/W	Default	Description
[23:0]	R/W	0	ETH digital debug registers

## 14.4 Inter-Integrated Circuit (I2C)

### 14.4.1 Overview

Inter-Integrated Circuit (IIC or I2C) is a multi-slave serial communication bus between ICs. A311D integrates the I2C interface and signals allowing communications with other I2C peripheral devices.

### 14.4.2 Features

The I<sup>2</sup>C Master Module has the following features:

- Support for 7-bit and 10-bit addressable devices
- Programmable bus speed including standard speed (100kBits/s) and fast speed (400kBits/sec)
- Error transfer detection
- “Transfer complete” indication by polling or interrupt (Interrupts handled by the ISA module. See the ISA module for details).
- Internal buffer holding up to 8 bytes for transfer (in either direction)
- Flexible architecture allowing the software to dictate the format of the I<sup>2</sup>C bit streams
- Manual setting of the I<sup>2</sup>C bus to accommodate a software only mode

### 14.4.3 Register Description

For I2C module in EE domain, each register final address = 0x FF805000 + offset \* 4 for master mode, final address = 0x FF806000 + offset \* 4 for slave mode.

**I2C\_M\_0\_CONTROL\_REG    0x7c00**

Bit(s)	R/W	Default	Description
31	R/W	0	CNTL_JIC: There is internal logic to dynamically enable the gated clocks. If this gated clock logic doesn't work, you can set This bit to always enable the clock. Setting This bit wastes power.
30	R	0	Unused
29-28	R/W	0	QTR_CLK_EXT: These two Bits extend the clock divider to 12 Bits: QTR_CLK = {[29:28],[21:12]}
27	R	0	unused
26	R	0	Read back level of the SDA line
25	R	0	Read back level of the SCL line
24	R/W	0	Sets the level of the SDA line if manual mode is enabled. If This bit is '0', then the SDA line is pulled low. If This bit is '1' then the SDA line is tri-stated.
23	R/W	0	Sets the level of the SCL line if manual mode is enabled. If This bit is '0', then the SCL line is pulled low. If This bit is '1' then the SCL line is tri-stated.
22	R/W	0	This bit is used to enable manual mode. Manual I2C mode is controlled by Bits 12,13,14 and 15 above.
21:12	R/W	0x142	QTR_CLK_DLY. This value corresponds to period of the SCL clock divided by 4 Quarter Clock Delay = * System Clock Frequency For example, if the system clock is 133Mhz, and the I2C clock period is 10uS (100khz), then Quarter Clock Delay = * 133 Mhz = 332

Bit(s)	R/W	Default	Description
11:8	R	-	READ_DATA_COUNT: This value corresponds to the number of bytes READ over the I2C bus. If this value is zero, then no data has been read. If this value is 1, then Bits [7:0] in TOKEN_RDATA_REG0 contains valid data. The software can read this register after an I2C transaction to get the number of bytes to read from the I2C device.
7:4	R	-	CURRENT_TOKEN: This value reflects the current token being processed. In the event of an error, the software can use this value to determine the error location.
3	R	-	ERROR: This read only Bit is set if the I2C device generates a NACK during writing. This bit is cleared at on the clock cycle after the START Bit is set to 1 indicating the start of list processing. Errors can be ignored by setting the ACK_IGNORE Bit(s) below. Errors will be generated on Writes to devices that return NACK instead of ACK. A NACK is returned by a device if it is unable to accept any more data (for example because it is processing some other real-time function). In the event of an ERROR, the I2C module will automatically generate a STOP condition on the bus.
2	R	-	STATUS: This bit reflects the status of the List processor: 0: IDLE 1: Running. The list processor will enter this state on the clock cycle after the START Bit is set. The software can poll the status register to determine when processing is complete.
1	R/W	0	ACK_IGNORE: Set to 1 to disable I2C ACK detection. The I2C bus uses an ACK signal after every byte transfer to detect problems during the transfer. Current Software implementations of the I2C bus ignore this ACK. This bit is for compatibility with the current Amlogic software. This bit should be set to 0 to allow NACK operations to abort I2C bus transactions. If a NACK occurs, the ERROR bit above will be set.
0	R/W	0	START: Set to 1 to start list processing. Setting This bit to 0 while the list processor is operating causes the list processor to abort the current I2C operation and generate an I2C STOP command on the I2C bus. Normally This bit is set to 1 and left high until processing is complete. To re-start the list processor with a new list (after a previous list has been exhausted), simply set This bit to zero then to one.

**I2C\_M\_0\_SLAVE ADDRESS 0x7c01**

Bit(s)	R/W	Default	Description
31:29	R	0	Reserved
28	R/W	0	USE_CNTL_SCL_LOW: If This bit is set to 1, then Bits[27:16] control the SCL low time.
27:16	R/W	0	SCL Low delay.
15:14	R	0	Unused
13-11	R/W	0	SCL_FILTER: A filter was added in the SCL input path to allow for filtering of slow rise times. 0 = no filtering, 7 = max filtering
10:8	R/W	0	SDA FILTER: A filter was added in the SDA input path to allow for filtering of slow rise times. 0 = no filtering, 7 = max filtering
7:0	R/W	0x00	SLAVE_ADDRESS. This is a 7-bit value for a 7-bit I2C device, or (0xF0   {A9,A8}) for a 10-bit I2C device. By convention, the slave address is typically stored in by first left shifting it so that it's MSB is D7 (The I2C bus assumes the 7-bit address is left shifted one). Additionally, since the SLAVE address is always an 7-bit value, D0 is always 0.  NOTE: The I2C always transfers 8-bits even for address. The I2C hardware will use D0 to dictate the direction of the bus. Therefore, D0 should always be '0' when this register is set.

**I2C\_M\_0\_TOKEN\_LIST\_REG0 0x7c02**

The register below describes the first 8 tokens in the token list.

Bit(s)	R/W	Default	Description
31:28	R/W	0x00	8th token in the list to process
27:24	R/W	0x00	7th token in the list to process
23:20	R/W	0x00	6th token in the list to process
19:16	R/W	0x00	5th token in the list to process
15:12	R/W	0x00	4th token in the list to process
11:8	R/W	0x00	3rd token in the list to process
7:4	R/W	0x00	2nd token in the list to process
3:0	R/W	0x00	1st token in the list to process (See the table below for token definitions)

**Table 14-1 Token Definitions**

Command Token	Value	Data	Description
END	0x0	N/A	Used to tell the I2C module that this is the end of the Token list. This token is not associated with the I2C bus, but rather with the state-machine that drives the token list processor.
START	0x1	N/A	The START Token is used to tell an I2C device that this is the beginning of an I2C transfer
SLAVE_ADDR-WRITE	0x2	7-bits	This bit-sequence is used to address a device and tell the device it is being WRITTEN
SLAVE_ADDR-READ	0x3	7-bits	This bit sequence is used to address a device and tell the device it is being READ.
DATA	0x4	8-bits	This 8-bit byte sequence is a byte transfer (READ or WRITE). The DATA token corresponds to a WRITE if it follows a SLAVE_ADDR-WRITE token. The DATA token corresponds to a READ if it follows a SLAVE_ADDR-READ token.
DATA-LAST	0x5	8-bits	Used to indicate the last 8-bit byte transfer is a byte transfer of a READ.
STOP	0x6	N/A	This tells the I2C device it is no longer being addressed

Write data associated with the DATA token should be placed into the I2C\_TOKEN\_WDATA\_REG0 or I2C\_TOKEN\_WDATA\_REG1 registers. Read data associated with the DATA or DATA-LAST token can be read from the I2C\_TOKEN\_RDATA\_REG0 or I2C\_TOKEN\_RDATA\_REG1 registers.

**I2C\_M\_0\_TOKEN\_LIST\_REG1 0x7c03**

Bit(s)	R/W	Default	Description
31:28	R/W	0x00	16th token in the list to process

27:24	R/W	0x00	15th token in the list to process
23:20	R/W	0x00	14th token in the list to process
19:16	R/W	0x00	13th token in the list to process
15:12	R/W	0x00	12th token in the list to process
11:8	R/W	0x00	11th token in the list to process
7:4	R/W	0x00	10th token in the list to process
3:0	R/W	0x00	9th token in the list to process

**I2C\_M\_0\_TOKEN\_WDATA\_REG0 0x7c04**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	4th data byte written for a DATA (write) token.
23:16	R/W	0x00	3rd data byte written for a DATA (write) token.
15:8	R/W	0x00	2nd data byte written for a DATA (write) token.
7:0	R/W	0x00	1st data byte written for a DATA (write) token.

**I2C\_M\_0\_TOKEN\_WDATA\_REG1 0x7c05**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	8th data byte written for a DATA (write) token.
23:16	R/W	0x00	7th data byte written for a DATA (write) token.
15:8	R/W	0x00	6th data byte written for a DATA (write) token.
7:0	R/W	0x00	5th data byte written for a DATA (write) token.

**I2C\_M\_0\_TOKEN\_RDATA\_REG0 0x7c06**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	4th data byte read for a DATA or DATA-LAST (READ) token.
23:16	R/W	0x00	3rd data byte read for a DATA or DATA-LAST (READ) token.
15:8	R/W	0x00	2nd data byte read for a DATA or DATA-LAST (READ) token.
7:0	R/W	0x00	1st data byte read for a DATA or DATA-LAST (READ) token.

**I2C\_M\_0\_TOKEN\_RDATA\_REG1 0x7c07**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	8th data byte read for a DATA or DATA-LAST (READ) token.
23:16	R/W	0x00	7th data byte read for a DATA or DATA-LAST (READ) token.

15:8	R/W	0x00	6th data byte read for a DATA or DATA-LAST (READ) token.
7:0	R/W	0x00	5th data byte read for a DATA or DATA-LAST (READ) token.

**I2C\_M\_1\_ 0x7800~0x7807**

See I2C\_M\_0

**I2C\_M\_2\_ 0x7400~0x7407**

See I2C\_M\_0

**I2C\_M\_3\_ 0x7000~0x7007**

See I2C\_M\_0

For I2C module in AO domain, each register final address = 0x FF805000 + offset \* 4 for master mode, final address = 0x FF806000 + offset \* 4 for slave mode.

**AO\_I2C\_M\_0\_CONTROL\_REG 0x0**

Bit(s)	R/W	Default	Description
31	R/W	0	CNTL_JIC: There is internal logic to dynamically enable the gated clocks. If this gated clock logic doesn't work, you can set this bit to always enable the clock. Setting this bit wastes power.
30	R	0	Unused
29-28	R/W	0	QTR_CLK_EXT: These two bits extend the clock divider to 12 bits: QTR_CLK = {[29:28],[21:12]}
27	R	0	unused
26	R	0	Read back level of the SDA line
25	R	0	Read back level of the SCL line
24	R/W	0	Sets the level of the SDA line if manual mode is enabled. If this bit is '0', then the SDA line is pulled low. If this bit is '1' then the SDA line is tri-stated.
23	R/W	0	Sets the level of the SCL line if manual mode is enabled. If this bit is '0', then the SCL line is pulled low. If this bit is '1' then the SCL line is tri-stated.
22	R/W	0	This bit is used to enable manual mode. Manual I2C mode is controlled by bits 12,13,14 and 15 above.
21:12	R/W	0x142	QTR_CLK_DLY. This value corresponds to period of the SCL clock divided by 4 Quarter Clock Delay = * System Clock Frequency For example, if the system clock is 133Mhz, and the I2C clock period is 10uS (100khz), then Quarter Clock Delay = * 133 Mhz = 332
11:8	R	-	READ_DATA_COUNT: This value corresponds to the number of bytes READ over the I2C bus. If this value is zero, then no data has been read. If this value is 1, then bits [7:0] in TOKEN_RDATA_REG0 contains valid data. The software can read this register after an I2C transaction to get the number of bytes to read from the I2C device.
7:4	R	-	CURRENT_TOKEN: This value reflects the current token being processed. In the event of an error, the software can use this value to determine the error location.

Bit(s)	R/W	Default	Description
3	R	-	ERROR: This read only bit is set if the I2C device generates a NACK during writing. This bit is cleared at on the clock cycle after the START bit is set to 1 indicating the start of list processing. Errors can be ignored by setting the ACK_IGNORE bit below. Errors will be generated on Writes to devices that return NACK instead of ACK. A NACK is returned by a device if it is unable to accept any more data (for example because it is processing some other real-time function). In the event of an ERROR, the I2C module will automatically generate a STOP condition on the bus.
2	R	-	STATUS: This bit reflects the status of the List processor: 0: IDLE 1: Running. The list processor will enter this state on the clock cycle after the START bit is set. The software can poll the status register to determine when processing is complete.
1	R/W	0	ACK_IGNORE: Set to 1 to disable I2C ACK detection. The I2C bus uses an ACK signal after every byte transfer to detect problems during the transfer. Current Software implementations of the I2C bus ignore this ACK. This bit is for compatibility with the current Amlogic software. This bit should be set to 0 to allow NACK operations to abort I2C bus transactions. If a NACK occurs, the ERROR bit above will be set.
0	R/W	0	START: Set to 1 to start list processing. Setting this bit to 0 while the list processor is operating causes the list processor to abort the current I2C operation and generate an I2C STOP command on the I2C bus. Normally this bit is set to 1 and left high until processing is complete. To re-start the list processor with a new list (after a previous list has been exhausted), simply set this bit to zero then to one.

**AO\_I2C\_M\_0\_SLAVE\_ADDR 0x1**

Bit(s)	R/W	Default	Description
31:29	R	0	Unused
28	R/W	0	USE_CNTL_SCL_LOW: If this bit is set to 1, then bits[27:16] control the SCL low time.
27:16	R/W	0	SCL Low delay. This is a new feature in M8baby. In the previous M8baby design, the SCL low time was controlled by bits[21:12] of the register above. In this design, the SCL delay is controlled independently by these bits.
15:14	R	0	Unused
13:11	R/W	0	SCL_FILTER: A filter was added in the SCL input path to allow for filtering of slow rise times. 0 = no filtering, 7 = max filtering
10:8	R/W	0	SDA FILTER: A filter was added in the SDA input path to allow for filtering of slow rise times. 0 = no filtering, 7 = max filtering
7:0	R/W	0x00	SLAVE_ADDRESS. This is a 7-bit value for a 7-bit I2C device, or (0xF0   {A9,A8}) for a 10-bit I2C device. By convention, the slave address is typically stored in by first left shifting it so that it's MSB is D7 (The I2C bus assumes the 7-bit address is left shifted one). Additionally, since the SLAVE address is always an 7-bit value, D0 is always 0. NOTE: The I2C always transfers 8-bits even for address. The I2C hardware will use D0 to dictate the direction of the bus. Therefore, D0 should always be '0' when this register is set.

**AO\_I2C\_M\_0\_TOKEN\_LIST0 0x2**

The register below describes the first 8 tokens in the token list.

Bit(s)	R/W	Default	Description
--------	-----	---------	-------------

31:28	R/W	0x00	8th token in the list to process
27:24	R/W	0x00	7th token in the list to process
23:20	R/W	0x00	6th token in the list to process
19:16	R/W	0x00	5th token in the list to process
15:12	R/W	0x00	4th token in the list to process
11:8	R/W	0x00	3rd token in the list to process
7:4	R/W	0x00	2nd token in the list to process
3:0	R/W	0x00	1st token in the list to process (See the table below for token definitions)

**Table 14-2 Token Definitions**

Command Token	Value	Data	Description
END	0x0	N/A	Used to tell the I2C module that this is the end of the Token list. This token is not associated with the I2C bus, but rather with the state-machine that drives the token list processor.
START	0x1	N/A	The START Token is used to tell an I2C device that this is the beginning of an I2C transfer
SLAVE_ADDR-WRITE	0x2	7-bits	This bit-sequence is used to address a device and tell the device it is being WRITTEN
SLAVE_ADDR-READ	0x3	7-bits	This bit sequence is used to address a device and tell the device it is being READ.
DATA	0x4	8-bits	This 8-bit byte sequence is a byte transfer (READ or WRITE). The DATA token corresponds to a WRITE if it follows a SLAVE_ADDR-WRITE token. The DATA token corresponds to a READ if it follows a SLAVE_ADDR-READ token.
DATA-LAST	0x5	8-bits	Used to indicate the last 8-bit byte transfer is a byte transfer of a READ.
STOP	0x6	N/A	This tells the I2C device it is no longer being addressed

Write data associated with the DATA token should be placed into the I2C\_TOKEN\_WDATA\_REG0 or I2C\_TOKEN\_WDATA\_REG1 registers. Read data associated with the DATA or DATA-LAST token can be read from the I2C\_TOKEN\_RDATA\_REG0 or I2C\_TOKEN\_RDATA\_REG1 registers.

#### **AO\_I2C\_M\_0\_TOKEN\_LIST1 0x3**

Bit(s)	R/W	Default	Description
31:28	R/W	0x00	16th token in the list to process
27:24	R/W	0x00	15th token in the list to process
23:20	R/W	0x00	14th token in the list to process
19:16	R/W	0x00	13th token in the list to process
15:12	R/W	0x00	12th token in the list to process

11:8	R/W	0x00	11th token in the list to process
7:4	R/W	0x00	10th token in the list to process
3:0	R/W	0x00	9th token in the list to process

**AO\_I2C\_M\_0\_WDATA\_REG0 0x4**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	4th data byte written for a DATA (write) token.
23:16	R/W	0x00	3rd data byte written for a DATA (write) token.
15:8	R/W	0x00	2nd data byte written for a DATA (write) token.
7:0	R/W	0x00	1st data byte written for a DATA (write) token.

**AO\_I2C\_M\_0\_WDATA\_REG1 0x5**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	8th data byte written for a DATA (write) token.
23:16	R/W	0x00	7th data byte written for a DATA (write) token.
15:8	R/W	0x00	6th data byte written for a DATA (write) token.
7:0	R/W	0x00	5th data byte written for a DATA (write) token.

**AO\_I2C\_M\_0\_RDATA\_REG0 0x6**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	4th data byte read for a DATA or DATA-LAST (READ) token.
23:16	R/W	0x00	3rd data byte read for a DATA or DATA-LAST (READ) token.
15:8	R/W	0x00	2nd data byte read for a DATA or DATA-LAST (READ) token.
7:0	R/W	0x00	1st data byte read for a DATA or DATA-LAST (READ) token.

**AO\_I2C\_M\_0\_RDATA\_REG1 0x7**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	8th data byte read for a DATA or DATA-LAST (READ) token.
23:16	R/W	0x00	7th data byte read for a DATA or DATA-LAST (READ) token.
15:8	R/W	0x00	6th data byte read for a DATA or DATA-LAST (READ) token.
7:0	R/W	0x00	5th data byte read for a DATA or DATA-LAST (READ) token.

**AO\_I2C\_M\_0\_TIMEOUT\_TH 0x8**

Bit(s)	R/W	Default	Description
31:24	R/W	0x00	8th data byte read for a DATA or DATA-LAST (READ) token.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
23:16	R/W	0x00	7th data byte read for a DATA or DATA-LAST (READ) token.
15:8	R/W	0x00	6th data byte read for a DATA or DATA-LAST (READ) token.
7:0	R/W	0x00	5th data byte read for a DATA or DATA-LAST (READ) token.

**AO\_I2C\_S\_CONTROL\_REG 0x0**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	REG POINTER: There are 5 internal registers inside the I2C slave module. The I2C Master sets this value using the byte that follows the address byte in the I2C data stream. Register 4 (numbered 0,1,...4) is the status register.
28	R/W	0	SEND READY: This bit is set to '1' by the ARC to indicate to the slave machine that the I2C slave module is ready to send data. This bit is cleared by the I2C module when it has sent 4 bytes to the I2C master. This bit is also available in the status register that can be read by the I2C master. The I2C master can read the status register to see when the I2C slave module has data to send.
27	R/W	0	RECEIVE READY: This bit is set to '1' by the ARC to indicate to the slave machine that the I2C slave module is ready to receive data. This bit is cleared by the I2C module when it has received 4 bytes from the I2C master. This bit is also available in the status register that can be read by the I2C master. The I2C master can read the status register to see when the I2C slave module is ready to receive data.
26	R	0	BUSY: Read only status bit. '1' indicates that the I2C slave module is sending or receiving data.
25	R/W	0	IRQ_EN: If this bit is set, then an interrupt will be sent to the ARC whenever 4 bytes have been read or 4 bytes have been written to the I2C slave module.
24	R/W	0	ACK Always: Typically the ACK of a slave I2C device is dependent upon the availability of data (if reading) and room to store data (when we are being written). Our I2C module has a status register that can be read continuously. This bit can be set if the I2C master wants to continually read the status register.
23-16	R/W	0	Slave Address: Bits [7:1] are used to identify the device. Bit [0] is ignored since this corresponds to the R/W bit.
15-8	R/W	0x27	HOLD TIME: Data hold time after the falling edge of SCL. This hold time is computed as Hold time = (MPEG system clock period) * (value + 1).
7	R/W	0	Enable: A '1' enables the I2C slave state machine.
6-0	R/W	0x06	Sampling rate. Defined as MPEG system clock / (value + 1). The SDA and SCL inputs into the slave module are sampled as a way of filtering the inputs. A rising or falling edge is determined by when 3 successive samples are either high or low respectively.

**AO\_I2C\_S\_SEND\_REG: Send Data 0x1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R/W	0	The I2C slave module can send up to 4 bytes of data starting with the byte located at bits [7:0]

**AO\_I2C\_S\_RECV\_REG: Received Data 0x2**

Bit(s)	R/W	Default	Description
31-0	R	0	This read only register corresponds to the 4 bytes of data written to the I2C slave module by an external I2C master. Bits [7:0] correspond to the first byte written by the I2C master.

**AO\_I2C\_S\_CNTL1\_REG 0x3**

Bit(s)	R/W	Default	Description
31-6	R	0	Unused
5-3	R/W	0	SCL_FILTER: A filter was added in the SCL input path to allow for filtering of slow rise times. 0 = no filtering, 7 = max filtering
2-0	R/W	0x00	SDA FILTER: A filter was added in the SDA input path to allow for filtering of slow rise times. 0 = no filtering, 7 = max filtering

## 14.5 Universal Asynchronous Receiver And Transmitter

### 14.5.1 Overview

There are a number of UART's in the chip that offer 2-wire (RX/TX) and 4-wire (RX/TX, CTS/RTS) connections at the digital I/O pins. Each UART contains one transmit FIFO and a receive FIFO (see depths below). The FIFO's are filled by the CPU and read by the CPU. In some cases, the receive FIFO can be configured to be pushed directly to DDR memory without CPU intervention.

Table 14-3 UART List

UART	RX/TX FIFO depths	RX FIFO DMA to DDR	Comment
UART_EE_A	128 bytes	Yes	Located in the EE domain
UART_EE_B	64 bytes	Yes	Located in the EE domain
UART_EE_C	64 bytes	Yes	Located in the EE domain
UART0-AO	64 bytes	No	Located in the Always On domain
UART2-AO	64 bytes	No	Located in the Always On domain

### 14.5.2 Features

**Input filters:** The CTS (clear to send) and RX (receive) input paths have input filters to deal with slow rise times. The filters are configurable to use a 125nS or 1uS sampling mechanism. There is an implied 3 system clock cycle delay (15nS for a typical system clock of 200Mhz) that is used to synchronize and detect the rising/falling edge of the RXD signal. The RXD signal may be passed through an optional filter to deglitch the external signal in noisy conditions. The deglitch filter has two settings which add to the "detection delay" of the RXD signal by the internal logic:

- Filter setting 1 (125nS strobe): 375nS ~ 2.6uS
- Filter setting 2 (1uS strobe): 3uS ~ 21uS

The filter is described in the register specification. If the filter is disabled, the shortest RXD low time and high time is 12 system clock cycles (60nS for a system clock of 200Mhz).

**Clear to Send:** CTS is a signal sent from the receiver UART back to the transmitting UART to tell the transmitting UART to stop sending data. The CTS signal must be received before the next START symbol is sent. The transmitting UART is allowed to send one more byte after the CTS signal is recognized. The CTS signal coming into the chip goes through some synchronization and detection which adds an additional 5 system clocks (typically 25nS for a 200Mhz system clock). This setup time for CTS detection is called CTSstop. The CTS input also has an optional filter can be used to deglitch the incoming CTS signal. If the filter is disabled, the CTS signal must be de-asserted 5 system clock cycles before the start of the next BYTE transfer. If the CTS filter is enabled, then additional time must be added to the 25nS requirement. There are two programmable filter settings that effectively delay CTS being seen by the internal logic:

- Filter setting 1 (125nS strobe): 375nS ~ 2.6uS
- Filter setting 2 (1uS strobe): 3uS ~ 21uS

**Interrupts:** The UARTs can generate interrupts if the receive FIFO exceeds a pre-programmed threshold. An interrupt can also be generated if there is a frame or parity error.

**Clock independent operation:** Because the system clock can be altered to accommodate dynamic frequency scaling, the UARTs have an option in which they use the 24Mhz crystal clock as the source for the UART.

### 14.5.3 Functional Description

The UART requires that a Baud Rate be established. The UART supports rates as slow as 1Hz up to rates as high as 8 MBits/Sec. Once the baud rate has been established, bytes are transmitted as they are written to the transmit-FIFO by the CPU. A large transmit-FIFO exists to allow the CPU to pre-load a transmit package because the CPU can often write faster than the UART can transmit the data.

Data this automatically received by the UART is placed into the receive FIFO one byte at a time. The receive-FIFO decouples the UART from the CPU allowing the CPU to read the UART byte data at a rate not dictated by the UART.

### 14.5.4 Register Description

The following register description is uniformly applied to all UART instantiations in the chip.

Base\_addr: 0xffd00000

Final\_addr = base\_addr + offset \* 4

UART\_EE\_A = 128x8 FIFOs

UART\_EE\_B = 64x8 FIFOs

UART\_EE\_C = 64x8 FIFOs

#### UART\_EE\_A\_WFIFO: Write data 0x9000

Bit(s)	R/W	Default	Description
31-8	R	0	unused
7-0	R/W	-	Write FIFO data. The Write FIFO holds 128 or 64 bytes. The Write FIFO can be written as long as it is not full.

#### UART\_EE\_A\_RFIFO: Read Data 0x9001

Bit(s)	R/W	Default	Description
31-8	R	0	unused
7-0	R/W	-	Read FIFO data. The Read FIFO holds 128 or 64 bytes. The empty flag can be used to determine if data is available

#### UART\_EE\_A\_CONTROL: UART Mode 0x9002

Bit(s)	R/W	Default	Description
31	R/W	0	Invert the RTS signal
30	R/W	0	Mask Error: Set to 1 to mask errors
29	R/W	0	Invert the CTS signal
28	R/W	0	Transmit byte Interrupt: Set to 1 to enable the generation an interrupt whenever a byte is read from the transmit FIFO
27	R/W	0	Receive byte Interrupt: Set to 1 to enable the generation an interrupt whenever a byte is written to the receive FIFO
26	R/W	0	Set to 1 to invert the TX pin
25	R/W	0	Set to 1 to invert the RX pin

24	R/W	0	Clear Error
23	R/W	0	Reset the receive state machine
22	R/W	0	Reset the transmit state machine
21-20	R/W	0	Character length: 00 = 8 Bits, 01 = 7 Bits, 10 = 6 Bits, 11 = 5 Bits
19	R/W	1	Parity Enable: Set to 1 to enable parity
18	R/W	0	Parity type: 0 = even, 1 = odd
17-16	R/W	0	Stop bit length: 00 = 1 bit, 01 = 2 Bits
15	R/W	0	Two Wire mode:
14	R/W	0	Unused
13	R/W	0	Receive Enable. Set to 1 to enable the UART receive function
12	R/W	0	Transmit Enable. Set to 1 to enable the UART transmit function
11-0	R/W	0x120	Old Baud rate

**UART\_EE\_A\_STATUS: UART Status 0x9003**

Bit(s)	R/W	Default	Description
31-27	R	0	Unused
26	R	0	UART_RECV_BUSY: This bit will be 1 if the uart receive state machine is busy
25	R	0	UART_XMIT_BUSY: This bit will be 1 if the uart transmit state machine is busy
24	R	0	RECV_FIFO_OVERFLOW:
23	R	0	CTS Level
22	R	0	Transmit FIFO Empty
21	R	0	Transmit FIFO Full
20	R	0	Receive FIFO empty
19	R	0	Receive FIFO full
18	R	0	This bit is set if the FIFO is written when it is full. To clear This bit, wriTE bit 24 of register 0x2132
17	R	0	Frame error. To clear This bit, wriTE bit 24 of register UART_EE_A_CONTROL
16	R	0	Parity error. To clear This bit, wriTE bit 24 of register UART_EE_A_CONTROL
15	R	0	Unused
14-8	R	0	Transmit FIFO count. Number of bytes in the transmit FIFO
7	R	0	Unused

6-0	R	0	Receive FIFO count. Number of bytes in the receive FIFO
-----	---	---	---

**UART\_EE\_A\_MISC: UART IRQ CONTROL      0x9004**

Bit(s)	R/W	Default	Description
31	R/W	0	Added a "just in case" bit that can be set to 1 to enable clocks always. The default is 0 meaning the auto-clock gating logic is enabled.
30	R/W	0	USE old Rx Baud: There was a bug in the RX baud rate generator. The Rx baud rate generator was re-designed to compute a baud rate correctly. If you want to use the old (stupid) logic, you can set This bit to 1.
29	R/W	0	ASYNC_FIFO_PURGE: This bit can be set to 1 after all UART bytes have been received in order to purge the data into the Async FIFO. This bit is needed because the <b>UART</b> receives 8-bit data, but the ASYNC FIFO can only be written with 16-bit data. In this case there might be a residual byte if the <b>UART</b> is not receiving an even number of bytes.
28	R/W	0	ASYNC_FIFO_EN: If This bit is set to 1, then the <b>UART</b> received data is automatically sent to the Async FIFO module which will in turn automatically send the data to DDR memory
27	R/W	0	CTS: Filter Timebase select: 1 = 1uS, 0 = 111nS timebase. A filter was added to the CTS input to allow for a little digital filtering. The amount of filtering is controlled by this timebase (longer = more filtering) and the value in Bits FILTER_SEL below.
26-24	R/W	0	CTS: FILTER_SEL: 0 = no filter, 7 = max filtering
23-20	R/W	0	old BAUD_RATE_EXT: These 4 Bits extend the baud rate divider to 16-bits: Baud Rate = {Reg4[23:20],Reg2[11:0]}
19	R/W	0	RX: Filter Timebase select: 1 = 1uS, 0 = 111nS timebase. A filter was added to the RX input to allow for a little digital filtering. The amount of filtering is controlled by this timebase (longer = more filtering) and the value in Bits FILTER_SEL below.
18-16	R/W	0	RX: FILTER_SEL: 0 = no filter, 7 = max filtering
15-8	R/W	32	XMIT_IRQ_CNT: The <b>UART</b> can be configured to generate an interrupt if the number of bytes in the transmit FIFO drops below this value.
7:0	R/W	15	RECV_IRQ_CNT: The <b>UART</b> can be configured to generate an interrupt after a certain number of bytes have been received by the <b>UART</b> .

**UART\_EE\_A\_REG5      0x9005**

Bit(s)	R/W	Default	Description
31-28	R/W	0	unused
27	R/W	0	Xtal2_clk_sel: 0: see Xtal_clk_sel 1: xtal_div2(12M)
26	R/W	0	Xtal_clk_sel: 0: xtal_div3(8M); 1: xtal(24M);(need set xtal_tick_en =1 first);
24	R/W	0	USE_XTAL_CLK: If this bit is set, then the clock for generating the <b>UART</b> Baud rate comes from the crystal pad. This allows the <b>UART</b> to operate independent of clk81.

23	R/W	0	USE New Baud rate. Over the years, the baud rate has been extended by concatenating bits from different registers. To take advantage of the full 23-bit baud rate generate (extended to 23 bits to accommodate very low baud rates), you must set this bit. If this bit is set, then the baud rate is configured using bits [22:0] below
22:0	R/W	15	NEW_BAUD_RATE: If bit[23] = 1 above, then the baud rate for the UART is computed using these bits. This was added in M6 to accommodate lower baud rates.

## 14.6 Infrared Remote

### 14.6.1 Overview

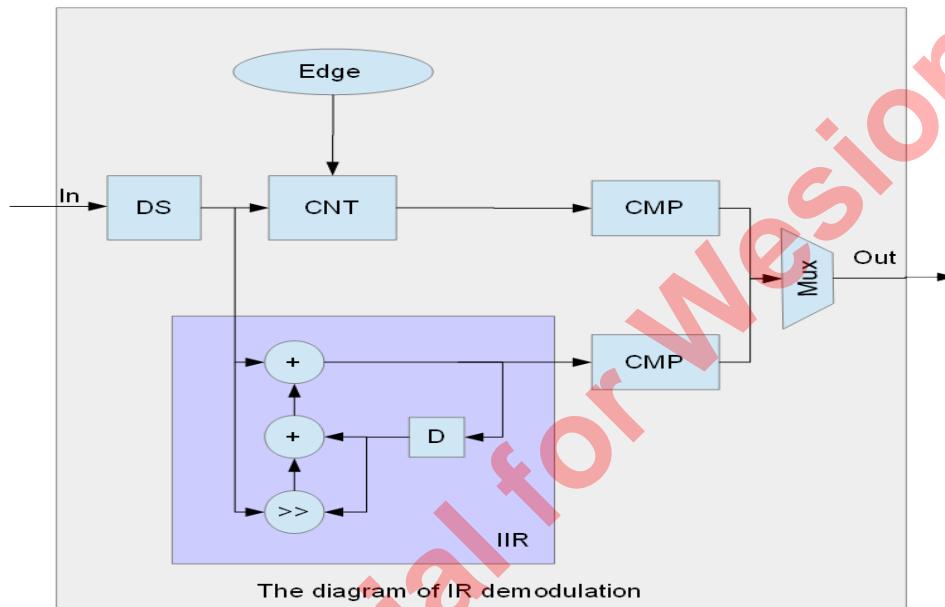

IR module includes 3 sub modules: IR demodulation, Legacy IR remote control and Multi-format IR remote control.

### 14.6.2 IR Demodulation

IR demodulation module demodulate the modulated signal to get the envelop signal.

IR demodulation diagram is shown below.

Figure 14-1 IR Demodulation Diagram

It implements two methods for demodulation. The input data is a one-bit stream.

The input data are down-sampled firstly. The rate of downsample are configured by register, ranges from 0 to 255.

One method is implemented in the upper path.

The CNT is used to count the time for '0' and '1'. It is cleared when input data changes( from 1 to 0 or from 0 to 1).

When ( $CNT > REG\_IR\_PROCT1 \&\& in == 1$ ) , it outputs '1'. REG\_IR\_PROCT1 is used to cancel the glitch. Actually, the operation of downsample also have some utility to cancel the glitch.

When ( $CNT > REG\_IR\_DECT0 \&\& in == 0$ ) , it outputs '0'. REG\_IR\_DECT0 is used to confirm the '0'. The value should be bigger than one carrier period.

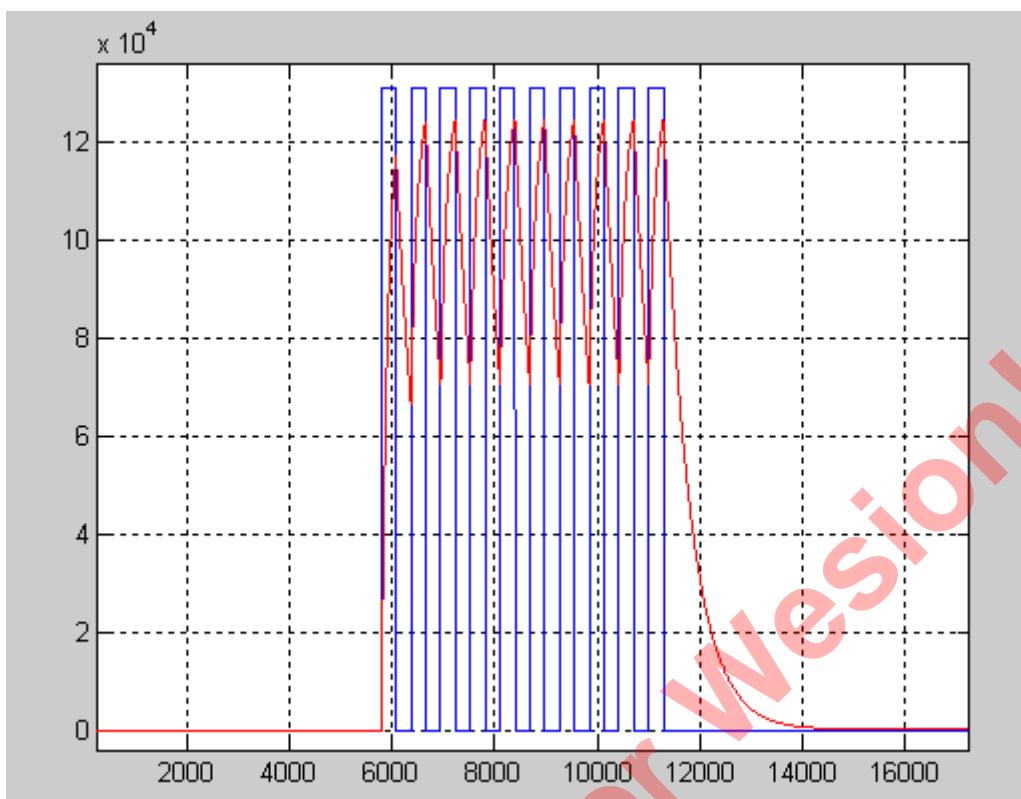

The other method is implemented in the lower path.

It is a one tap IIR filter. The input data control the integrating factor and the factor can be configured from registers. When 1 inputs, the accumulator can grow quickly. When 0 input, the accumulator decays slowly, and when the number of 0 is bigger enough, it decays soon.

When ( $accum > REG\_IR\_IIR\_THD1$ ), it outputs '1'.

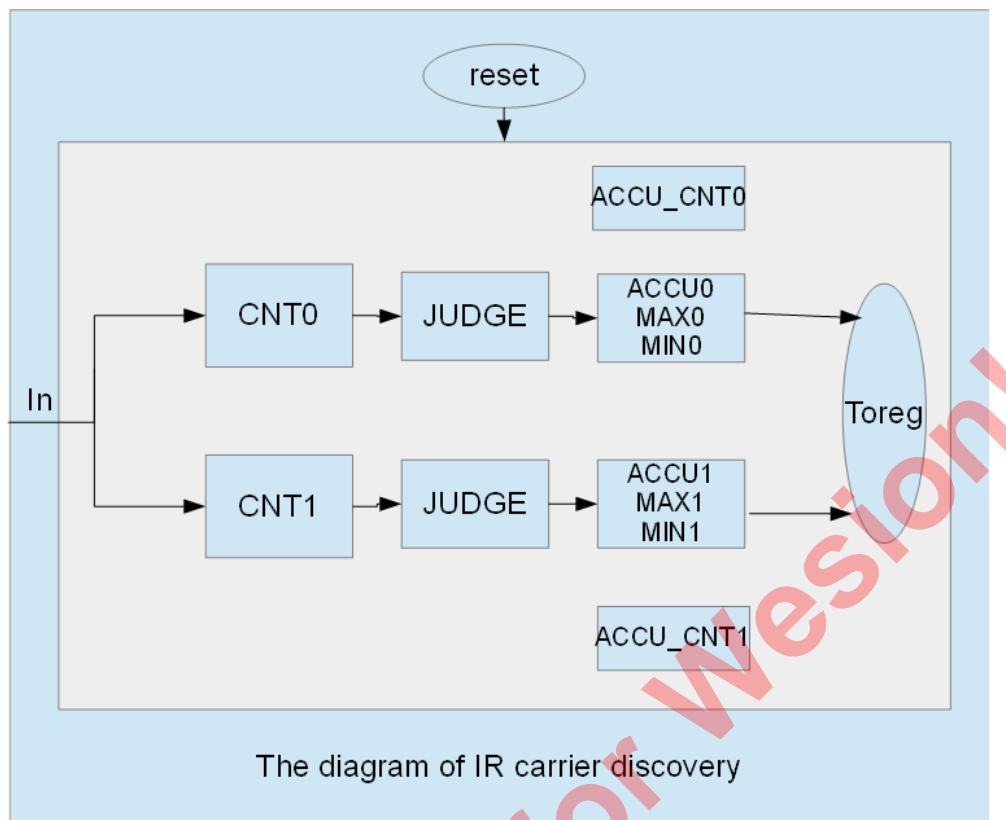

When ( $accum < REG\_IR\_IIR\_THD0$ ), it outputs '0'.

The diagram shows the simple simulation result. The blue is the input data, the red is the filter out.

**Figure 14-2 Simulation Result of IR Demulation**

Because the input carrier signal is a rectangular wave signal, the carrier can be estimated easily by count the wave period. For estimating precisely, the counter for the long “0” and start period and and glitch should be removed.

The simple diagram is shown below:

**Figure 14-3 IR Carrier Discovery**

CNT is the counter for time of “0” and “1”.

JUDGE is used to remove the long “0” and glitch.

ACCU\_CNT is the counter for number of accumulating. If ACCU\_CNT== REG\_IR\_ST\_CNT\_THD, then write the value to registers.

For example:

Set REG\_IR\_ST\_CNT\_THD to 256, then accumulates 256 times.

The carrier can be calculated:

$$Fc = F_{sys}/(RO\_IR\_SUM\_CNT0 + RO\_IR\_SUM\_CNT1)*256;$$

$$DUT = RO\_IR\_SUM\_CNT1/(RO\_IR\_SUM\_CNT0 + RO\_IR\_SUM\_CNT1);$$

Where Fc is the carrier frequency, Fsys is the system clock frequency, DUT is the carrier duty ratio.

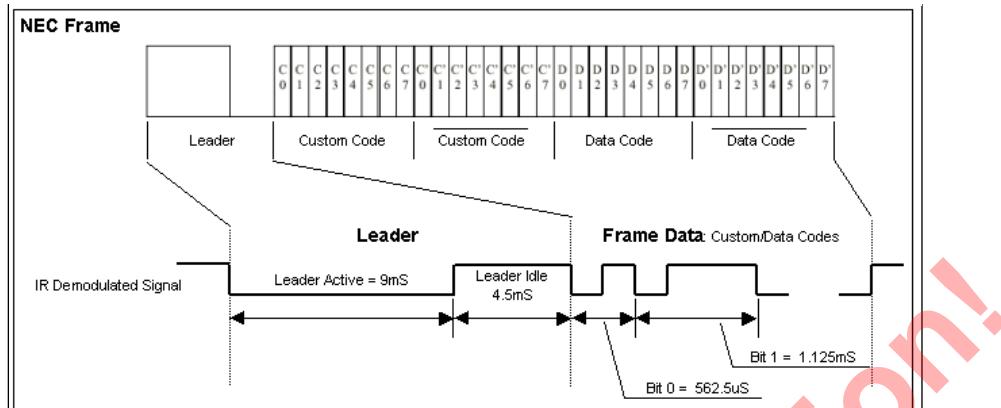

### 14.6.3 Legacy IR Control

The Legacy IR Remote control module has two modes of operation:

- NEC Frame decoder mode
- General Time Measurement mode

**NEC Frame Decoder:** The NEC Frame Decoder mode operates by analyzing the waveform of a TV

**Figure 14-4 NEC Frame Decoder**

remote.

The waveform has a number of components, each of which must fit within a time window to be considered valid. If the entire waveform meets the specifications described by the registers below, then the TV remote codes are captured and an interrupt is generated.

**General Time Measurement:** Some remotes don't follow the standard NEC format, so additional registers provide the ability to measure the time between rising and/or falling edges of the IR signal. Since the time measurement is done in hardware, the software only needs to read a "width" measurement from a register for every rising and/or falling edge event.

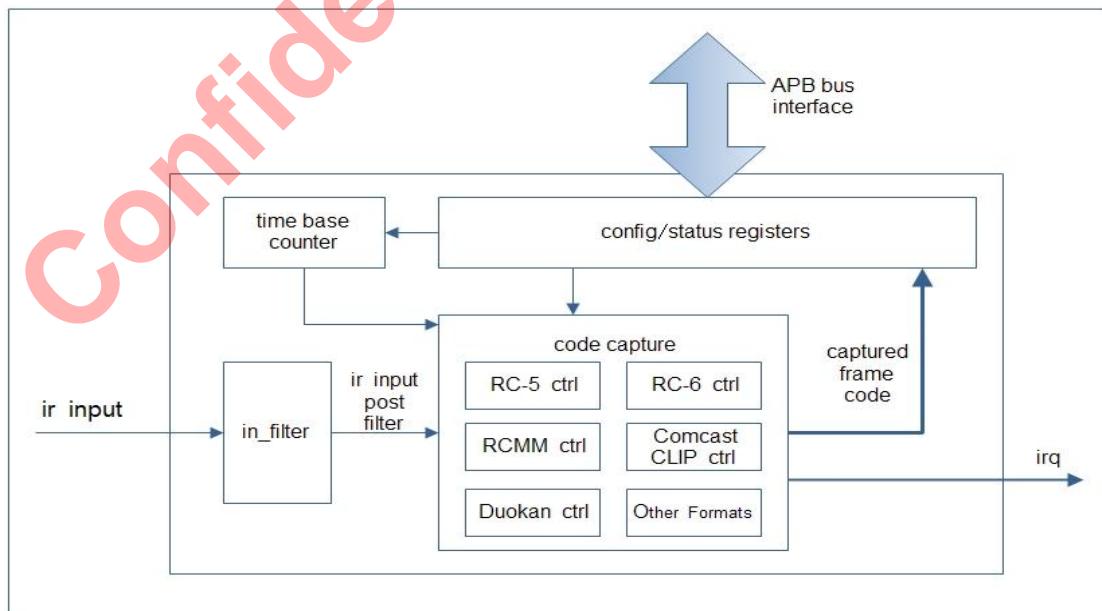

#### 14.6.4 Multi Format IR Control

The decoder mainly consisted of two blocks:

- Decoder with input filter
- A set of registers including control & clock, data and tuning

The function diagram of IR decoder is illustrated in the figure below.

**Figure 14-5 IR Decoder Function Block**

IR Decoder decodes the IR remote control input signal. 13 operation modes are supported:

- Hardware Decode IR transmission protocol compatible frame decoder mode ( NEC MITSUBISHI Thomson Toshiba Sony SIRC RC5 RC6 RCMM Duokan Comcast Sanyo Modes)
- General programmable time measurement frame decoder mode (General Mode)

In Hardware Decode Mode, the Decoder uses signal pattern search mechanism to decode data frame. It can detect logical '0' , '1' , "00","01","10" and "11", as well as data frame start and end. Whenever Decoder detects and decodes the data frame, the data are kept in data register.

In General Mode, the Decoder uses edge detection mechanism to decode data frame. It can detect each input signal edge and record the time between two edges. The time measurement result is kept in control register.

The user should set proper operation mode corresponding to the selection of remote controller.

There is a simple time-based signal Filter between the signal input and the Decoder. The Filter is programmable and helps to improve signal integrity.

#### 14.6.5 RegisterDescription

The following registerDescription is uniformly applied to all UART instantiations in the chip.

Base\_adr: 0xff808000

Final\_adr = base\_adr + offset \*4

##### **AO\_IR\_DEC\_DEMOD\_CNTL0 0x30**

Bits	R/W	Default	Description
31			Ir demodulor soft_reset:write 1 to reset ir_demodulor,will auto clr to 0
30			Reg_ir_fd_reset :It is used to reset the carrier detection module.write 1 to reset ,will auto clr to 0
29			Reg_ir_demod_mode:It is used to set the demod mode. 0 = count mode; 1 = iir mode.default is 0
28			Ir demodulor clk gate bypass:write 1 will bypass clk gate,default is 0
27:16			Reg_ir_st_cnt_thd:It is used to set the statistics number for carrier detection.default is 0x40
15:8			Reg_ir_ds_rate:It is used to set the downsample rate.default is 0x8
7:4			Reg_ir_fsft_1:It is used to set the shift value for input data "1".default is 0x7
3:0			Reg_ir_fsft_0:It is used to set the shift value for input data "0".default is 0x9

##### **AO\_IR\_DEC\_DEMOD\_CNTL1 0x31**

Bits	R/W	Default	Description
31			Reg_ir_demod_en:ir demod enable ,default is 0
30			Reg_ir_invt:ir input invert, invert input at 1.default is 0
29:16			Reg_ir_proctect1:It is used to set the protection threshold for 1. It is used to filter the glitch.default is 0xa
13:0			Reg_ir_detect0:It is used to set the detection threshold for signal "0".default is 0x3e8

**AO\_IR\_DEC\_DEMOD\_IIR\_THD 0x32**

Bits	R/W	Default	Description
31:16			Reg_ir_iir_thd1:It is used to set the detection threshold for “1” in iir mode.default is 0xdac
15:0			Reg_ir_iir_thd0:It is used to set the detection threshold for “0” in iir mode.default is 0xdac

**AO\_IR\_DEC\_DEMOD\_THD0 0x33**

Bits	R/W	Default	Description
29:16			Reg_ir_thd0_low:It is used to set the low threshold for “0” when statistics.default is 0x12c
13:0			Reg_ir_thd0_high:It is used to set the high threshold for “0” when statistics.default is 0x1770

**AO\_IR\_DEC\_DEMOD\_THD1 0x34**

Bits	R/W	Default	Description
29:16			Reg_ir_thd1_low:It is used to set the low threshold for “1” when statistics.default is 0x12c
13:0			Reg_ir_thd1_high:It is used to set the high threshold for “1” when statistics.default is 0x1770

**AO\_IR\_DEC\_DEMOD\_SUM\_CNT0 0x35**

Bits	R/W	Default	Description
25:0			Ro_ir_sum_cnt0:It is used to report the sum value for the statistics data “0”.READ ONLY

**AO\_IR\_DEC\_DEMOD\_SUM\_CNT1 0x36**

Bits	R/W	Default	Description
25:0			Ro_ir_sum_cnt1:It is used to report the sum value for the statistics data “1”.READ ONLY

**AO\_IR\_DEC\_DEMOD\_CNT0 0x37**

Bits	R/W	Default	Description
29:16			Ro_ir_max_cnt0:It is used to report the maximum value for the statistics data “0”.READ ONLY
13:0			Ro_ir_min_cnt0:It is used to report the minimum value for the statistics data “0”.READ ONLY

**AO\_IR\_DEC\_DEMOD\_CNT1 0x38**

Bits	R/W	Default	Description
29:16			Ro_ir_max_cnt1:It is used to report the maximum value for the statistics data “1”.READ ONLY
13:0			Ro_ir_min_cnt1:It is used to report the minimum value for the statistics data “1”.READ ONLY

**AO\_IR\_DEC\_LDR\_ACTIVE: Leader Active Time 0x00**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	unused
28-16	R/W	0x 1d8	Max Leader ACTIVE time: 9.44mS assuming base rate = 20uS
15-13	R	0	unused
12-0	R/W	0x1ac	Min Leader ACTIVE time: 8.56mS assuming base rate = 20uS

This register controls the min/max leader active time window. For most TV remote controls, the leader active time is about 9mS. The values in this register correspond to counts of the base rate programmed by register 0x2124

**AO\_IR\_DEC\_LDR\_IDLE: Leader Idle Time 0x01**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-26	R	0	unused
28-16	R/W	0xf8	Max Leader IDLE time: 4.96mS assuming base rate = 20uS
15-13	R	0	unused
12-0	R/W	0xca	Min Leader IDLE time: 4.04mS assuming base rate = 20uS

This register controls the min/max leader IDLE time window. For most TV remote controls, the leader idle time is about 4.5mS. The values in this register correspond to counts of the base rate programmed by register: 0x2124

**AO\_IR\_DEC\_LDR\_REPEAT: Repeat Leader Idle Time 0x02**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-26	R	0	Unused
25-16	R/W	0x7a	Max REPEAT Leader IDLE time: 2.44mS assuming base rate = 20uS
15-10	R	0	unused
9-0	R/W	0x66	Min REPEAT Leader IDLE time: 2.04mS assuming base rate = 20uS

This register controls the repeat leader IDLE time window. The repeat key uses the standard leader active time (9ms) but a shorter leader idle time.

**AO\_IR\_DEC\_BIT\_0: BIT 0 Identification Time 0x03**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-26	R	0	Unused
25-16	R/W	0x42	Max BIT 0 time: 1.32mS assuming base rate = 20uS
15-10	R	0	Unused
9-0	R/W	0x2e	Min BIT 0 time: 0.92mS assuming base rate = 20uS

This register controls the min/max BIT 0 time window. For most TV remote controls, the bit 0 time is about 1.125mS. The values in this register correspond to counts of the base rate programmed by register: 0x2124

#### **AO\_IR\_DEC\_REG0: Base Rate Generator 0x04**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R	0	Just in case bit. Normally this bit is set to 0 so that the auto-clock gating is enabled. If there is a problem related to the auto-clock gating, then this bit can be set to one to disable the auto-clock gating.
30-28	R/W	0	FILTER_COUNT: This is a new feature to Nike. The IR remote input now has a simple filter that accommodates slow rise times by providing a little hysteresis. The logic works as follows. If the input is low, then an input signal will only be considered HIGH if it remains high for (FILTER_COUNT * 111nS). Similarly, if the input is currently high, it will only be considered LOW if the input signal remains low for (FILTER_COUNT * 111nS).
27-25	R	0	Unused
24-12	R/w	0xFA0	Max Frame Time. 80mS assuming base rate = 20uS This value is used to determine if a code is a repeat code (e.g. leader followed by no data for this amount of time). This value can also be used to catch slow remote codes (i.e. code sequences that are longer than expected).
11-0	R/W	0x13	This value dictates the base rate time for all measurements associated with the IR decoder. In the past, the base rate was divided from the system clock. In the current design, the base rate is divided from a fixed 1uS timer. This 1uS timer is constant and doesn't change (even when the system clock does) $\text{Base rate} = (\text{count} + 1) * 1\mu\text{s}$

This register controls the master rate generator for all width measurements made by the IR decoder module.

#### **AO\_IR\_DEC\_FRAME: Frame Data 0x05**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-0	R	0	Frame Data. Format: {custom code, ~custom code, data, ~data}

Note: New keys will be ignored until this register is read if the *hold first* key bit is set in the decode control register. Reading this register resets an internal hold first flag.

#### **AO\_IR\_DEC\_STATUS: Frame Status 0x06**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	Sim faster: Reserved
30	R/W	0	BIT_1_MATCH_EN: Set this bit to 1 to enable qualification of bit 1 times. In the previous IR decoder module, frame detection only looked at the BIT 0 time to identify a zero bit. If a zero bit time wasn't found, then it was assumed that the bit was a 1. In the updated IR decoder module, the module will look at the BIT 0 time to find zero bits, and the BIT 1 time to find 1 bits. If the width of a pulse doesn't match the zero or the one bit width time, then the frame is considered invalid.
29-20	R/W	0x89	Max BIT 1 time: 2.74mS assuming base rate = 20uS
19-10	R/W	0x57	Min BIT 1 time: 1.74mS assuming base rate = 20uS

9	R	-	IRQ Status. 1 if there is an interrupt
8	R	-	IR Decoder input. This is the level of the digital signal coming into the IR module for decoding. This is the same as reading the I/O pad level.
7	R	-	BUSY. 1 if the decoder is busy
6-4	R	0	Decoder Status: For debug only 000: OK 001: last frame timed out 010: leader time error (invalid IR signal) 011: repeat error (repeat leader, but other IR transitions found). 100: Invalid bit
3-0	R	0	Frame Status Bit 3: Frame data valid Bit 2: data code error (data != ~data in IR bit stream) Bit 1: custom code error (custom_code != ~custom_code in IR bit stream) Bit 0: 1 = repeat key, 0 = standard key

**AO\_IR\_DEC\_REG1: Decode / Interrupt Control 0x07**

Bit(s)	R/W	Default	Description
31	R	0	Unused
30	R/W	0	CNTL_1uS_EQ_CLK: This bit should be set to 1 if the clk81 (system clock) is less than 50 Mhz.
29	R/W	0	CNTL_111nS_EQ_CLK: This bit should be set to 1 if the clk81 (system clock) is less than 50 Mhz.
28-16	R	0	Time measurement since the last time the internal time counter was reset by the rising and/or falling edge of the IR signal. The selection of reset on rising and/or falling edge is determined by the selection of the IRQ (Bits 3-2 below)
15	R/W	1	ENABLE: If this bit is 1, then the state-machines are enabled. If this bit is zero, then the state-machines cleanup and immediately return to idle.
14	R/W	0	USE SYSTEM CLOCK: This is a new feature. 1 = use the system clock, 0 = use the 1uS timebase tick. During normal operation, the module is setup to create a 20uS tick from the 1uS internal timebase of the chip. If the chip is configured to operate using the 32khz RTC oscillator, the 1uS timebase is invalid and therefore the 20uS timebase is invalid. In order to measure time correctly, the IR remote circuit can use the system clock (which in this case is the 32khz oscillator clock) as the master timebase.
13-9	R/W	1f	Number of bits in the IR frame (N-1)

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
8-7	R/W	1f	<p>Decoder mode</p> <p>00: NEC Frames: Decode Leader and 32 bits</p> <p>01: Only accumulate bits (skip the leader)</p> <p>10: Measure Mode: The internal width measuring counter is reset on the rising and/or falling edge of the IR remote signal based on the settings of IRQ Selection below. Just before being reset, the measured width is captured and stored so that it can be read in bits [28:16] of this register.</p> <p>11: NEC Frames: Decode Leader and 32 bits</p>
6	R/W	1	<p>Hold First Key. If this bit is set true, then the frame data register (0x2125) will only be updated if hasn't already been updated. Once updated, the frame data register will not be updated again until it has been read. This bit can be used to guarantee the first TV remote code captured will not be overwritten by subsequent transmissions from a TV remote.</p> <p>NOTE: You must read the frame data register to clear an internal hold first flag if this bit is set.</p>
5-4	R/W	11	<p>Frame mask. These bits are used to qualify frames for capture.</p> <p>00: Capture all frames good or bad</p> <p>01: Capture only frames where data==data. Ignore custom codes</p> <p>10: Capture only frames where custom_code = ~custom_code. Ignore data codes</p> <p>11: Capture only frames where (data==~data) and (custom_code = ~custom_code)</p>
3-2	R/W	0	<p>IRQ Selection and width measurement reset:</p> <p>00: IR Decoder done</p> <p>01: IR input rising or falling edge detected</p> <p>10: IR input falling edge detected</p> <p>11: IR rising edge detected</p>
1	R/W	0	IR Polarity. Polarity of the input signal (VD[0])
0	R/W	0	Set to 1 to reset the IR decoder. This is useful because the IR remote state machine thinks in terms of milliseconds and may take tens of milliseconds to return to idle by itself.

### **AO\_MF\_IR\_DEC\_LDR\_ACTIVE: Leader Active control    0x10**

This register controls the min/max Leader Active time window. For example, for NEC format, the Leader Active time is about 9mS. To identify a Leader Active time between 8.60 mS and 9.40 mS (assuming base resolution = 20uS), user can set Max duration = 0x1d6 ('d470) to represent 9.40 mS, and set Min duration = 0x1ae ('d430) to represent 8.60 mS.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	Unused
28-16	R/W	0	Max duration of Leader's active part
15-13	R	0	Unused
12-0	R/W	0	Min duration of Leader's active part

### **AO\_MF\_IR\_DEC\_LDR\_IDLE: Leader Idle control   0x11**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31-29	R	0	Unused
28-16	R/W	0	Max duration of Leader's idle part
15-13	R	0	Unused
12-0	R/W	0	Min duration of Leader's idle part

**AO\_MF\_IR\_DEC\_LDR\_REPEAT: Repeat Leader Idle Time 0x12**

Bit(s)	R/W	Default	Description
31-26	R	0	Unused
25-16	R/W	0	Max duration of Repeat Code's Leader. In NECformat, it defines for the repeat leader's idle part. In Toshiba format, it defines for the repeat leader's second idle part (In Toshiba format, the repeat leader's first idle part has the same duration time as the normal leader idle part.)
15-10	R	0	Unused
9-0	R/W	0	Min duration of Repeat Code's Leader

**AO\_MF\_IR\_DEC\_BIT\_0 0x13**

Bit(s)	R/W	Default	Description
31-26	R	0	Unused
25-16	R/W	0	Max duration of Duration Setting Register 0. It defines max timing duration for: Logic "0" for NEC/Toshiba/Sony/Thomas format or Half trailer bit for RC6 format (RC6's half trailer bit typically 888.89us) or time of Duokan/RCMM/4ppm format's Logic "00"
15-10	R	0	Unused
9-0	R/W	0	Min duration of Duration Setting Register 0.

**AO\_MF\_IR\_DEC\_REG0 0x14**

Bit(s)	R/W	Default	Description
31	R/W	0	Clock gating control just in case. Set 1 can force clock gating disabled.
30-28	R/W	0	Filter ctrl. Set the monitor timing for input filter, bigger value means longer monitor time. Value 0 = no filtering.
27-25	R	0	Unused

24-12	R/W	0	Max frame time. Max duration of one whole frame.
11-0	R/W	0	<p>Base time parameter. Used to generate the timing resolution. Resolution = (base_time_parameter + 1) * (1/ Freq_sys_clk). For example, if Frequency of sys_clk is 1Mhz, and base_time_parameter=19, Then resolution = (19+1)*(1uS) = 20uS.</p>

**AO\_MF\_IR\_DEC\_STATUS 0x16**

Bit(s)	R/W	Default	Description
31	R/W	0	<p>Frame data valid 1. (This bit is set to 1 when a captured frame is updated/stored into "FrameBody_1" register. A read of "FrameBody_1" register will clear This bit. "FrameBody_1" register is used to store the over 32bit MSBs of the formats whose length is more than 32 bit )</p>
30	R/W	0	bit_1_match_en. Set to 1 to enable the check of whether logic"1" bit matches timing configure during the frame input process.
29-20	R/W	0	<p>Max Duration 1. Max duration of Duration Setting Register 1. It defines max duration for: Logic"1" for NEC/Toshiba/Sony format or Whole trailer bit for RC6 format (RC6's whole trailer bit typically 1777.78us) or time of Duokan/RCMM/4ppm format's Logic "01"</p>
19-10	R/W	0	Min Duration 1. Min duration of Duration Setting Register 1.
9	R	0	irq_status. Appear as 1 if there is an interrupt.
8	R	0	<p>ir_i_sync. IR remote serial input after synchronization. This is the level of the digital signal coming into the IR module for decoding. This is the same as reading the I/O pad level.</p>
7	R	0	Busy. When =1, means state machine is active.
6-4	R	0	<p>Decoder_status ( for debug only ). 000: OK 001: last frame timed out 010: leader time error (invalid IR signal) 011: repeat error (repeat leader, but other IR transitions found). 100: Invalid bit</p>
3-0	R	0	<p>Frame status. bit 3: Frame data valid (This bit is set to 1 when a captured frame is updated/stored into "FrameBody" register. A read of "FrameBody" register will clear This bit.)</p>

Bit(s)	R/W	Default	Description
			If store and read occurs at the same time, This bit is set to 1 in common, But if "Hold first" is set to true and this valid Bit is already 1, a read clear takes precedence and This bit is clear to 0. ) bit 2: data code error (data != ~data in IR bit stream) bit 1: custom code error (custom_code != ~custom_code in IR bit stream) bit 0: 1 = received frame is repeat key, 0 = received frame is normal key

**AO\_MF\_IR\_DEC\_REG1 0x17**

Bit(s)	R/W	Default	Description
31	R/W	0	Set to 1 to use faster timebase.. .
30	R/W	0	cntl_1us_eq_clk. Just use sys_clk to relace 1uS tick.
29	R/W	0	cntl_xtal3_eq_clk. Just use sys_clk to relace 111ns tick.
28-16	R	0	Pulse Width Counter. It stores the internal counter of pulse width duration. Commonly used as time measurement when decode_mode is set to measure width mode (software decode). Time measurement starts at the last time the internal time counter was reset by the rising and/or falling edge of the IR signal. The selection of reset on rising and/or falling edge is determined by the IRQ Selection field (Bits 3-2 below)
15	R/W	0	Enable. 1 = enable the state machine of IR decoder. 0 = disable the state machine of IR decoder.
14	R/W	0	cntl_use_sys_clk. Use sys_clk for the timebase. It's useful when sys_clk at low frequency ( such as 32Khz ) and cannot create 1uS timebase tick. 1 = use the system clock as timebase. 0 = use the 1uS timebase tick as timebase.
13-8	R/W	0	bit_length minus 1. (N-1). Used to set the value of frame body's bit length (frame body commonly includes address and data code part). If a format has 24 bit frame body, this value shall be set to 23.
7	R/W	0	Record_at_error. 1= record the frame body and status forcibly, even if data/custom code error check enabled by frame_mask and relative error occurs. 0 = if data/custom code error check enabled by frame_mask and relative error occurs, not record the frame body and status forcibly
6	R/W	0	Hold_first Used to hold the first captured frame data. If This bit is set to 1, then the "FrameBody/FrameBody_1" register will only be updated if hasn't already been updated. Once updated, the "FrameBody/FrameBody_1" register will not be updated again until it has been read. This bit can be used to guarantee the first TV remote code captured will not be overwritten by subsequent transmissions from a TV remote. NOTE: Read the "FrameBody" register can clear the internal "Frame data valid" flag, and read the "FrameBody_1" register can clear the "Frame data valid 1" flag.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
5-4	R/W	0	<p>Frame_mask.</p> <p>Some formats' body include bit-inversed data or custom/address code for error check.</p> <p>00 = ignore error check from either data or custom/address code</p> <p>01= check if data code matches its inverse values, ignore error check from custom/address code</p> <p>10= check if custom/address code matches its inverse values, ignore error check from data code</p> <p>11= check if data and custom codes match their inverse values</p>
3-2	R/W	0	<p>Irq_sel. IRQ Selection and width measurement reset:</p> <p>00: IR Decoder done</p> <p>01: IR input rising or falling edge detected</p> <p>10: IR input falling edge detected</p> <p>11: IR rising edge detected</p>
1	R/W	0	IR input polarity selection. Used to adjust/invert the polarity of IR input waveform.
0	R/W	0	Decoder Reset. Set to 1 to reset the IR decoder. This is useful because the IR remote state machine thinks in terms of milliseconds and may take tens of milliseconds to return to idle by itself.

**AO\_MF\_IR\_DEC\_REG2      0x18**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-27	R	0	Unused
26	R/W	0	<p>Width_low_enable. Enable counter record of low pulse width duration.</p> <p>0 = do not force enable of width low counter record</p> <p>1 = force enable of width low counter record</p> <p>Some IR formats<sup>3</sup> decoding need to use internal width low counter record. By default, the width low counter record is enabled automatically for related formats. This bit is used for enable forcibly just in case.</p> <p>Besides, if “leader plus stop bit” method is enabled for repeat detection, This bit is also need to be enabled.</p>
25	R/W	0	<p>Width_high_enable. Enable counter record of high pulse width duration.</p> <p>0 = do not force enable of width high counter record</p> <p>1 = force enable of width high counter record</p> <p>Some IR formats' decoding need to use internal width high counter record. By default, the width high counter record is enabled automatically for related formats. This bit is used for enable forcibly just in case.</p>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
24	R/W	0	<p>Enable “leader plus stop bit” method for repeat detection.            0 = “leader plus stop bit” method disabled            1 = “leader plus stop bit” method enabled</p> <p>Some IR formats use one normal frame’s leader followed by a stop bit to represent repeat. There is no frame data in this kind repeat frame.</p> <p>To use this method,  <code>width_low_enable</code> ( Bit 26 of 0x20 offset register) shall be set to 1,            and <code>max_duration_3</code> and <code>min_duration_3</code> in 0x28 offset register shall be set to appropriate value for stop bit’s timing duration.</p>
23-22	R	0	Unused
21-16	R/W	0	<p>Repeat_Bit_index.</p> <p>These Bits are used for compare bit method to set the index of the bit that is used as repeat flag. The index value can be 0 to 63.</p> <p>Compare bit method is one of the methods for repeat detection. Some IR formats use one bit in frame to represent whether the frame is repeat.</p>
15	R/W	0	<p>Running_count_tick_mode.</p> <p>This bit is only valid when <code>use_clock_to_counter</code> Bit is 0.</p> <p>0 = use 100uS as increasing time unit of frame-to-frame counter            1 = use 10uS as increasing time unit of frame-to-frame counter</p>
14	R/W	0	<p>Use_clock_to_counter.</p> <p>If This bit is set to 1, the running_count_tick_mode Bit is ignored.</p> <p>0 = do not use system clock as increasing time unit of frame-to-frame counter            1 = use system clock as increasing time unit of frame-to-frame counter</p>
13	R/W	0	<p>Enable frame-to-frame time counter (running-counter).</p> <p>0 = frame-to-frame time counter disabled            1 = frame-to-frame time counter enabled</p> <p>If enabled, the frame-to-frame counter increases every 100uS or 10uS until it reaches its max value(all Bits are 1) or it is reset. When it reaches its max value, it keeps the value until it is reset. When it is reset, it becomes zero and then begin increasing again. The counter can be reset even when it has not reached its max value. The increasing time unit can be 100uS or 10uS or system clock frequency which is set by running_count_tick_mode and use_clock_to_counter settings.</p> <p>When a frame’s data are captured and stored into FrameBody/FrameBody_1 register, frame-to-frame counter is reset to zero. After reset to zero, the frame-to-frame counter will begin increasing again, until it reaches its max value or it is reset.</p> <p>For repeat frame detection, users can use hardware detection by enabling compare frame or compare bit method, or users can read frame-to-frame counter to let software to make the decision.</p>

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
12	R/W	0	<p>Enable repeat time check for repeat detection. This bit is valid only when compare frame method or compare Bit method is enabled.</p> <p>0 = repeat time check disabled 1 = repeat time check enabled</p> <p>When repeat frame detection is enabled by enabling compare frame or compare Bit method, the frame time interval may need to be checked in order to decide whether the frames are repeat (key pressed without release) or not.</p> <p>You can configure the repeat_time_max value by setting 0x38 offset register.</p> <p>If frame interval is smaller than the “repeat time max”, it may be considered as repeat. If frame interval is bigger than the “repeat time max”, it is considered as not repeat.</p>
11	R/W	0	<p>Enable compare frame method for repeat detection.</p> <p>0 = compare frame method disabled 1 = compare frame method enabled</p> <p>Some IR formats transfer the same data frame as repeat frame when the key is kept pressed without release. For repeat detection, compare frame method can be used.</p> <p>If a new frame and the old received frame are the same and the repeat time is under the limit( frame-to-frame time counter value is smaller than the repeat_time_max ), the status register's frame_status0 is set to 1 automatically as repeat detected flag.</p> <p>You can configure the repeat_time_max value by setting 0x38 offset register.</p>
10	R/W	0	<p>Enable compare Bit method for repeat detection.</p> <p>0 = compare Bit method disabled 1 = compare Bit method enabled</p> <p>Some IR formats use only one bit to represent whether the frame is repeat. You can compare only one bit instead of comparing the whole frame for repeat detection. If compare frame method is enabled, then this bit is ignored.</p>
9	R/W	0	<p>Disable read-clear of FrameBody/FrameBody_1.</p> <p>0 = read-clear enabled 1 = read-clear disabled</p> <p>FrameBody/FrameBody_1 registers are read-cleared in default. When these registers are read, they are cleared to zero. This bit is used to disable this read-clear feature.</p> <p>( FrameBody/FrameBody_1 registers are used to store captured frame data ).</p>
8	R/W	0	<p>input stream bit order.</p> <p>0 = LSB first mode (first bit in input stream is considered as LSB) 1 = MSB first mode (first bit in input stream is considered as MSB)</p> <p>Note:</p> <p>Commonly the following formats shall set 1 to enable MSB first mode ( unless you insist on LSBfirst mode for your specified use):</p> <p>RC5, RC5 extend, RC6, RCMM, Duokan, Comcast</p>
7:4	R	0	Unused

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
3:0	R/W	0	Decode_mode.(format selection) 0x0 =NEC 0x1= skip leader (just Bits, without leader) 0x2=General time measurement (measure width, software decode) 0x3=MITSUBISHI 0x4=Thomson 0x5=Toshiba 0x6=Sony SIRC 0x7=RC5 0x8=Reserved 0x9=RC6 0xA=RCMM 0xB=Duokan 0xC=Reserved 0xD=Reserved 0xE=Comcast 0xF=Sanyo

**AO\_MF\_IR\_DEC\_DURATN2 0x19**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-26	R	0	Unused
25-16	R/W	0	Max duration of Duration Setting Register 2. It defines max duration for: Half bit for RC5/6 format (RC5 typically 888.89us for half bit, RC6 typically 444.44us) or time of Duokan/RCMM/4ppm format's Logic "10" or time of Comcast/16ppm's base duration
15-10	R	0	Unused
9-0	R/W	0	Min duration of Duration Setting Register 2.

**AO\_MF\_IR\_DEC\_DURATN3 0x1a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-26	R	0	Unused

25-16	R/W	0	Max duration of Duration Setting Register 3. It defines max duration for: Whole bit for RC5/6 format (RC5 typically 1777.78us for whole bit, RC6 typically 888.89us) or time of Duokan/RCMM/4ppm format's Logic "11" or time of Comcast/16ppm's offset duration
15-10	R	0	Unused
9-0	R/W	0	Min duration of Duration Setting Register 3.

**AO\_MF\_IR\_DEC\_FRAME: Frame Body ( Frame Data, LSB 32Bit ) 0x1b**

Note: New keys will be ignored until **FrameBody** register is read if the *hold first* key Bit is set in the decode control register. Reading this register resets an internal frame data valid flag.

Bit(s)	R/W	Default	Description
31-0	R	0	32 bit Read-Only register stores frame body (LSB 32 bit) captured from IR remote data flow, commonly includes custom/address code and data code.

**AO\_MF\_IR\_DEC\_FRAME: Frame Body 1 ( Frame Data, MSB 32Bit ) 0x1b**

Note: New keys will be ignored until **FrameBody** register is read if the *hold first* key Bit is set in the decode control register. Reading this register resets an internal frame data valid flag.

Bit(s)	R/W	Default	Description
31-0	R	0	Stores frame body excess 32 bit range. (MSB 32 bit)

**AO\_MF\_IR\_DEC\_STATUS\_1 0x1c**

Bit(s)	R/W	Default	Description
31-20	R	0	Unused
19-0	R	0	Stores the last frame-to-frame counter value before the last counter reset caused by the last frame data record/update.

**AO\_MF\_IR\_DEC\_STATUS\_2 0x1d**

Bit(s)	R/W	Default	Description
31-20	R	0	Unused
19-0	R	0	Stores the value of the frame-to-frame counter which is running currently.

## 14.7 Pulse-Width Modulation

### 14.7.1 Overview

The chip has 5 PWM modules that can be connected to various digital I/O pins, among which 3 are in EE domain and 2 is in AO domain. Each PWM is driven by a programmable divider driven by a 4:1 clock selector. The PWM signal is generated using two 16-bit counters. One is the High and Low counter, which is individually programmable with values between 1 and 65535. Using a combination of the divided clock (divide by N) and the HIGH and LOW counters, a wide number of PWM configurations are possible. The other is delta-sigma counter, generate 18-bit sigma, the PWM-out is the highest sigma. The PWM outputs vs counters are also illustrate below.

Figure 14-6 PWM Block Diagram

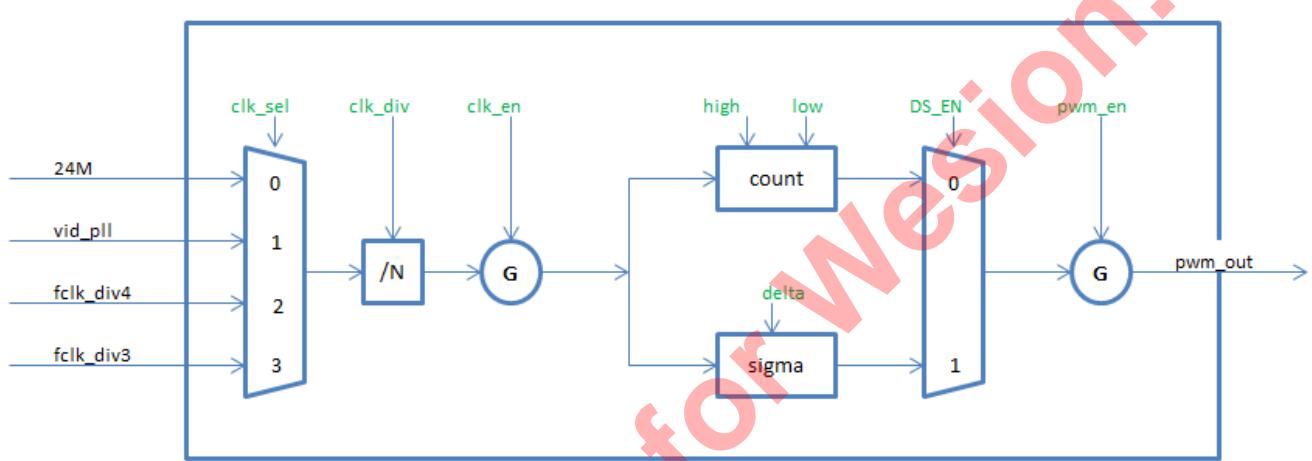

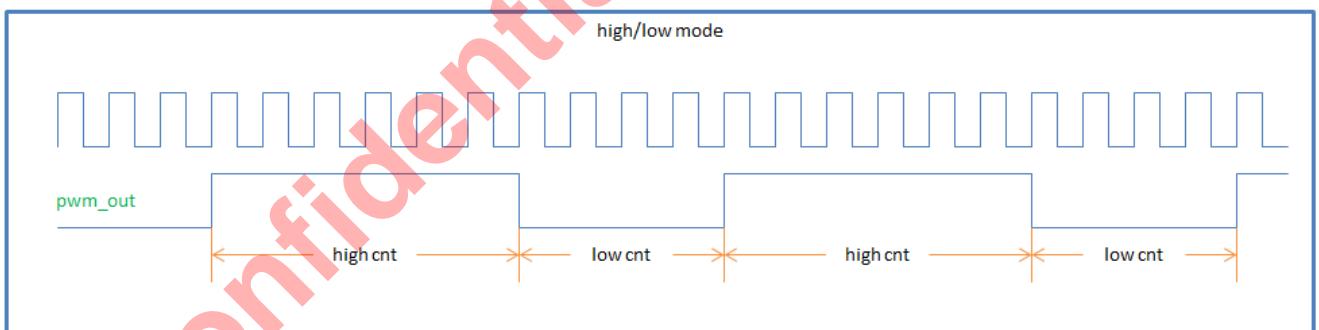

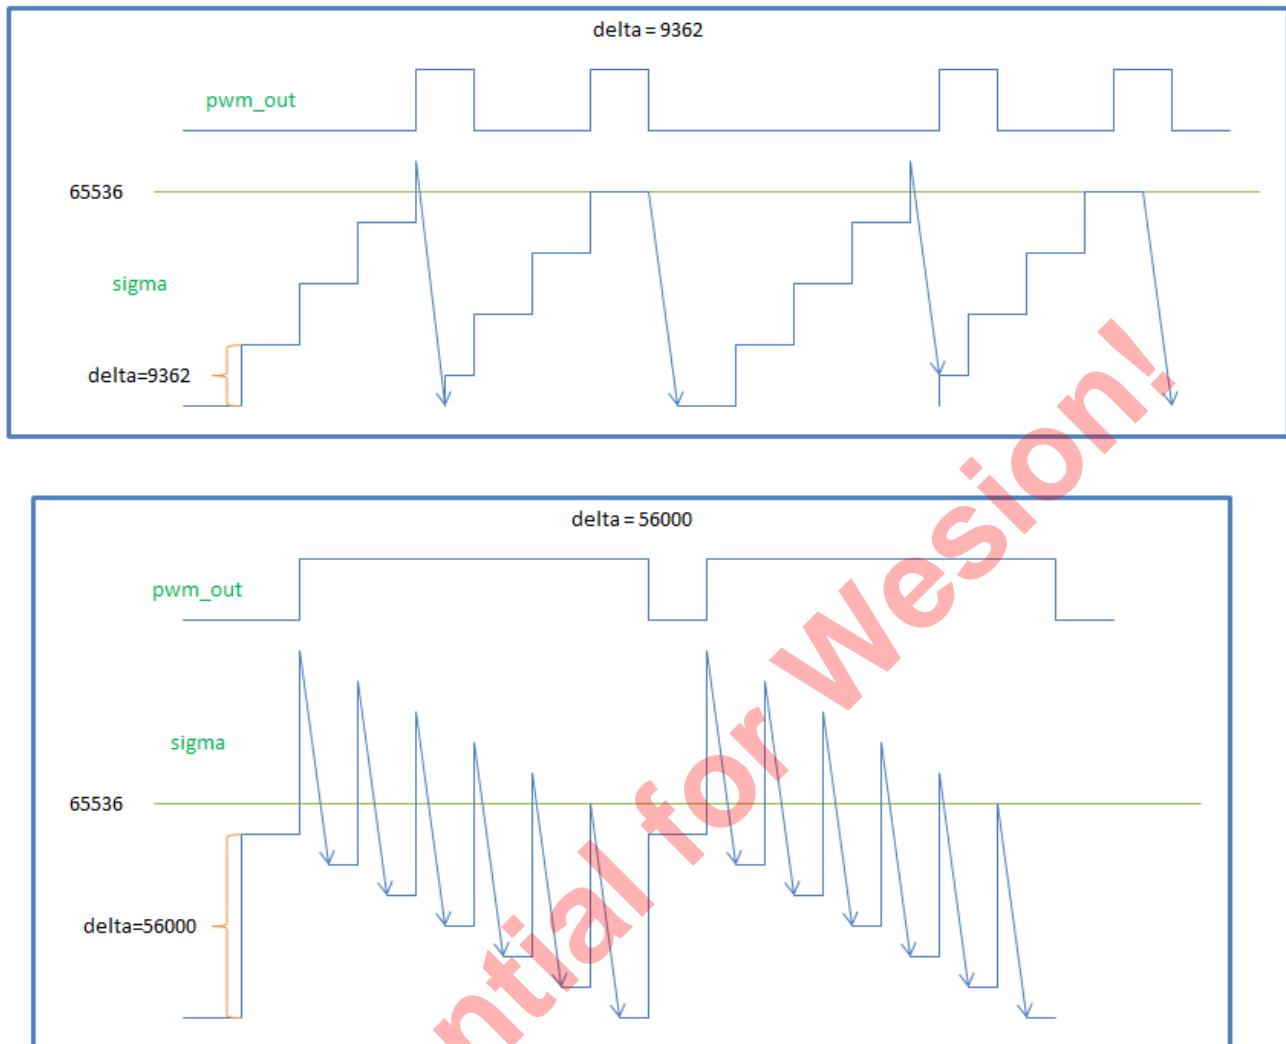

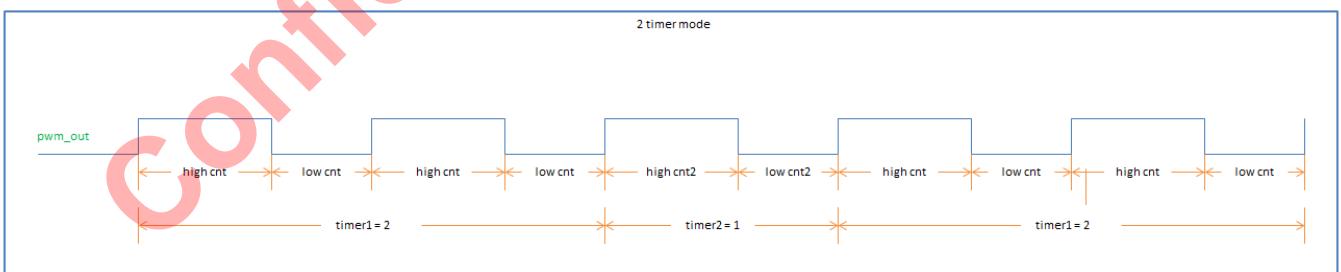

Figure 14-7 High/Low counter

**Figure 14-8 Delta-sigma conter, delta = 9362 & delta = 56000**

PWM 2 timer mode is illustrated as following:

**Figure 14-9 2 timer mode**

## 14.7.2 RegisterDescription

Each PWM module contains two PWM generators call A and B and controlled by the following registers.

For PWM modules in EE domain, the each register's final address = $0\x{ffd00000} + \text{offset} * 4$

### PWM\_PWM\_A 0x6c00

Bit(s)	R/W	Default	Description
--------	-----	---------	-------------

31-15	R/W	0	PWM_A_HIGH: This sets the high time (in clock counts) for the PWM_A generator output
15-0	R/W	0	PWM_A_LOW: This sets the high time (in clock counts) for the PWM_A generator output

**PWM\_PWM\_B 0x6c01**

Bit(s)	R/W	Default	Description
31-15	R/W	0	PWM_B_HIGH: This sets the high time (in clock counts) for the PWM_B generator output
15-0	R/W	0	PWM_B_LOW: This sets the high time (in clock counts) for the PWM_B generator output

**PWM\_MISC\_REG\_AB 0x6c02**

Bit(s)	R/W	Default	Description
31	R/W	0	pwm_B_hiz when hiz mode, pwm_o will connect to pad_oe, then pad_o will equal this bit
30	R/W	0	pwm_A_hiz when hiz mode, pwm_o will connect to pad_oe, then pad_o will equal this bit
29	R/W	0	pwm_B_constant_en
28	R/W	0	pwm_A_constant_en
27	R/W	0	pwm_B_inv_en
26	R/W	0	pwm_A_inv_en
25	R/W	0	cntl_pwm_a2_en
24	R/W	0	cntl_pwm_b2_en
23	R/W	0	PWM_B_CLK_EN: Set this bit to 1 to enable PWM B clock
22-16	R/W	0	PWM_B_CLK_DIV: Selects the divider (N+1) for the PWM B clock. See the clock tress document
15	R/W	0	PWM_A_CLK_EN: Set this bit to 1 to enable PWM A clock
14-8	R/W	0	PWM_A_CLK_DIV: Selects the divider (N+1) for the PWM A clock. See the clock tress document
7-6	R/W	0	PWM_B_CLK_SEL: Select the clock for the PWM B. See the clock tress document
5-4	R/W	0	PWM_A_CLK_SEL: Select the clock for the PWM A. See the clock tress document
3	R/W	0	DS_B_EN: This bit is only valid if PWM_B_EN is 0: if this bit is set to 1, then the PWM_B output is configured to generate a delta sigma output based on the settings in the register below. If this bit is set to 0, then the PWM_B output is set low.
2	R/W	0	DS_A_EN: This bit is only valid if PWM_A_EN is 0: if this bit is set to 1, then the PWM_A output is configured to generate a delta sigma output based on the settings in the register below. If this bit is set to 0, then the PWM_A output is set low.
1	R/W	0	PWM_B_EN: If this bit is set to 1, then the PWM_B output is configured to generate a PWM output based on the register above. If this bit is 0, then the PWM_B output is controlled by DS_B_EN above.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
0	R/W	0	PWM_A_EN: If this bit is set to 1, then the PWM_A output is configured to generate a PWM output based on the register above. If this bit is 0, then the PWM_A output is controlled by DS_A_EN above.

**DS\_A\_B 0x6c03**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	DS_B_VAL: This value represents the delta sigma setting for channel B (PWM_B)
15-0	R/W	0	DS_A_VAL: This value represents the delta sigma setting for channel A (PWM_A)

**PWM\_TIME\_AB 0x6c04**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	A_timer1
23:16	R/W	0	A_timer2
15:8	R/W	0	B_timer1
7:0	R/W	0	B_timer2

**PWM\_A2 0x6c05**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	PWM_A2_HIGH: This sets the high time (in clock counts) for the PWM_A2 generator output
15-0	R/W	0	PWM_A2_LOW: This sets the high time (in clock counts) for the PWM_A2 generator output

**PWM\_B2 0x6c06**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	PWM_B2_HIGH: This sets the high time (in clock counts) for the PWM_B2 generator output
15-0	R/W	0	PWM_B2_LOW: This sets the high time (in clock counts) for the PWM_B2 generator output

**PWM\_BLINK\_AB 0x6c07**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-10	R	0	Reserved
9	R/W	0	blink enable for pwm B
8	R/W	0	blink enable for pwm A
7-4	R/W	0	blink times for pwm B
3-0	R/W	0	blink times for pwm A

**PWM\_PWM\_C\_D: 0x6800~0x6807**

See the registers for PWM A/B

**PWM\_PWM\_E\_F: 0x6400~0x6407**

See the registers for PWM A/B

AO PWM' clock sources are xtal, clk81, fclk\_div3, fclk\_div4.

For the following register, each register's final address =0xFF807000 + offset\*4

**AO\_PWM\_PWM\_A: PWM\_A\_DUTY\_CYCLE 0x0**

Bit(s)	R/W	Default	Description
31-15	R/W	0	PWM_A_HIGH: This sets the high time (in clock counts) for the PWM_A generator output
15-0	R/W	0	PWM_A_LOW: This sets the high time (in clock counts) for the PWM_A generator output

**AO\_PWM\_PWM\_B: PWM\_B\_DUTY\_CYCLE 0x1**

Bit(s)	R/W	Default	Description
31-15	R/W	0	PWM_B_HIGH: This sets the high time (in clock counts) for the PWM_B generator output
15-0	R/W	0	PWM_B_LOW: This sets the high time (in clock counts) for the PWM_B generator output

**AO\_PWM\_MISC\_REG\_AB: 0x2**

Bit(s)	R/W	Default	Description
31	R/W	0	pwm_B_hiz when hiz mode, pwm_o will connect to pad_oe, then pad_o will equal this bit
30	R/W	0	pwm_A_hiz when hiz mode, pwm_o will connect to pad_oe, then pad_o will equal this bit
29	R/W	0	pwm_B_constant_en set this bit to 1, then pwm can support 0%(100%) duty output
28	R/W	0	pwm_A_constant_en set this bit to 1, then pwm can support 0%(100%) duty output
27	R/W	0	pwm_B_inv_en set this bit to 1, pwm output is inverted
26	R/W	0	pwm_A_inv_en set this bit to 1, pwm output is inverted
25	R/W	0	Pwm_a2_en
24	R/W	0	Pwm_b2_en
23	R/W	0	PWM_B_CLK_EN: Set this bit to 1 to enable PWM B clock
22-16	R/W	0	PWM_B_CLK_DIV: Selects the divider (N+1) for the PWM B clock. See the clock tress document
15	R/W	0	PWM_A_CLK_EN: Set this bit to 1 to enable PWM A clock
14-8	R/W	0	PWM_A_CLK_DIV: Selects the divider (N+1) for the PWM A clock. See the clock tress document

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
7-6	R/W	0	PWM_B_CLK_SEL: Select the clock for the PWM B. See the clock tree document
5-4	R/W	0	PWM_A_CLK_SEL: Select the clock for the PWM A. See the clock tree document
3	R/W	0	DS_B_EN: This bit is only valid if PWM_B_EN is 0: if this bit is set to 1, then the PWM_B output is configured to generate a delta sigma output based on the settings in the register below. If this bit is set to 0, then the PWM_B output is set low.
2	R/W	0	DS_A_EN: This bit is only valid if PWM_A_EN is 0: if this bit is set to 1, then the PWM_A output is configured to generate a delta sigma output based on the settings in the register below. If this bit is set to 0, then the PWM_A output is set low.
1	R/W	0	PWM_B_EN: If this bit is set to 1, then the PWM_B output is configured to generate a PWM output based on the register above. If this bit is 0, then the PWM_B output is controlled by DS_B_EN above.
0	R/W	0	PWM_A_EN: If this bit is set to 1, then the PWM_A output is configured to generate a PWM output based on the register above. If this bit is 0, then the PWM_A output is controlled by DS_A_EN above.

**AO\_PWM\_DELTA\_SIGMA\_AB 0x3**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	DS_B_VAL: This value represents the delta sigma setting for channel B (PWM_B)
15-0	R/W	0	DS_A_VAL: This value represents the delta sigma setting for channel A (PWM_A)

**AO\_PWM\_TIME\_AB 0x4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	A1_timer
23:16	R/W	0	A2_timer
15:8	R/W	0	B1_timer
7:0	R/W	0	B2_timer

**AO\_PWM\_A2 0x5**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	PWM_A2_HIGH: This sets the high time (in clock counts) for the PWM_A2 generator output
15-0	R/W	0	PWM_A2_LOW: This sets the high time (in clock counts) for the PWM_A2 generator output

**AO\_PWM\_B2 0x6**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	PWM_B2_HIGH: This sets the high time (in clock counts) for the PWM_B2 generator output
15-0	R/W	0	PWM_B2_LOW: This sets the high time (in clock counts) for the PWM_B2 generator output

**AO\_PWM\_BLINK\_AB 0x7**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-10	R	0	Reserved
9	R/W	0	blink enable for pwm B
8	R/W	0	blink enable for pwm A
7-4	R/W	0	blink times for pwm B
3-0	R/W	0	blink times for pwm A

For the following register, each register's final address= 0xFF802000 + offset \* 4

**AO\_PWM\_PWM\_C: PWM\_C\_DUTY\_CYCLE 0x0**

This is a new module to Nike. It replaces the older delta sigma (PWM like) generator in the HIU. This module allows the software to select either a PWM or delta-sigma output using the same module. There are two outputs: PWM\_C and PWM\_D. Either of these can be programmed to be PWM outputs or delta sigma outputs.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	PWM_C_HIGH: This sets the high time (in clock counts) for the PWM_C generator output
15-0	R/W	0	PWM_C_LOW: This sets the high time (in clock counts) for the PWM_C generator output

**AO\_PWM\_PWM\_D: PWM\_D\_DUTY\_CYCLE 0x1**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	PWM_D_HIGH: This sets the high time (in clock counts) for the PWM_D generator output
15-0	R/W	0	PWM_D_LOW: This sets the high time (in clock counts) for the PWM_D generator output

**AO\_PWM\_MISC\_REG\_CD: 0x2**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	pwm_D_hiz when hiz mode, pwm_o will connect to pad_oe, then pad_o will equal this bit
30	R/W	0	pwm_C_hiz when hiz mode, pwm_o will connect to pad_oe, then pad_o will equal this bit
29	R/W	0	pwm_D_constant_en set this bit to 1, then pwm can support 0%(100%) duty output
28	R/W	0	pwm_C_constant_en set this bit to 1, then pwm can support 0%(100%) duty output
27	R/W	0	pwm_D_inv_en set this bit to 1, pwm output is inverted

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
26	R/W	0	pwm_C_inv_en set this bit to 1, pwm output is inverted
25	R/W	0	Pwm_C2_en
24	R/W	0	Pwm_D2_en
23	R/W	0	PWM_D_CLK_EN: Set this bit to 1 to enable PWM Dclock
22-16	R/W	0	PWM_D_CLK_DIV: Selects the divider (N+1) for the PWM Dclock. See the clock tress document
15	R/W	0	PWM_C_CLK_EN: Set this bit to 1 to enable PWM C clock
14-8	R/W	0	PWM_C_CLK_DIV: Selects the divider (N+1) for the PWM C clock. See the clock tress document
7-6	R/W	0	PWM_D_CLK_SEL: Select the clock for the PWM D. See the clock tress document
5-4	R/W	0	PWM_C_CLK_SEL: Select the clock for the PWM C. See the clock tress document
3	R/W	0	DS_D_EN: This bit is only valid if PWM_D_EN is 0: if this bit is set to 1, then the PWM_D output is configured to generate a delta sigma output based on the settings in the register below. If this bit is set to 0, then the PWM_D output is set low.
2	R/W	0	DS_C_EN: This bit is only valid if PWM_C_EN is 0: if this bit is set to 1, then the PWM_C output is configured to generate a delta sigma output based on the settings in the register below. If this bit is set to 0, then the PWM_C output is set low.
1	R/W	0	PWM_D_EN: If this bit is set to 1, then the PWM_D output is configured to generate a PWM output based on the register above. If this bit is 0, then the PWM_D output is controlled by DS_D_EN above.
0	R/W	0	PWM_C_EN: If this bit is set to 1, then the PWM_C output is configured to generate a PWM output based on the register above. If this bit is 0, then the PWM_C output is controlled by DS_C_EN above.

**AO\_PWM\_DELTA\_SIGMA\_CD 0x3**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-15	R/W	0	DS_D_VAL: This value represents the delta sigma setting for channel D (PWM_D)
15-0	R/W	0	DS_C_VAL: This value represents the delta sigma setting for channel C (PWM_C)

**AO\_PWM\_TIME\_CD 0x4**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-24	R/W	0	C1_timer
23:16	R/W	0	C2_timer
15:8	R/W	0	D1_timer
7:0	R/W	0	D2_timer

**AO\_PWM\_C2 0x5**

Bit(s)	R/W	Default	Description
31-15	R/W	0	PWM_C2_HIGH: This sets the high time (in clock counts) for the PWM_C generator output
15-0	R/W	0	PWM_C2_LOW: This sets the high time (in clock counts) for the PWM_C generator output

**AO\_PWM\_D2 0x6**

Bit(s)	R/W	Default	Description
31-15	R/W	0	PWM_D2_HIGH: This sets the high time (in clock counts) for the PWM_D generator output
15-0	R/W	0	PWM_D2_LOW: This sets the high time (in clock counts) for the PWM_D generator output

**AO\_PWM\_BLINK\_CD 0x7**

Bit(s)	R/W	Default	Description
31-10	R	0	Reserved
9	R/W	0	blink enable for pwm D
8	R/W	0	blink enable for pwm C
7-4	R/W	0	blink times for pwm D
3-0	R/W	0	blink times for pwm C

## 14.8 SAR ADC

### 14.8.1 Overview

This SAR ADC is a general purpose ADC for measuring analog signals. The module can make RAW ADC measurements or average a number of measurements to introduce filtering. The SAR ADC is a single block so an analog mux is placed in front to allow multiple different measurements to be made sequentially. Timing of the samples, and delays between muxing are all programmable as is the averaging to be applied to the SAR ADC.

### 14.8.2 Register Description

Each register final address = 0xff809000 + offset \* 4

**SAR\_ADC\_REG0: Control Register #0 0x80**

Bit(s)	R/W	Default	Description
31	R	0	PANEL DETECT level.
30	R/W	0	DELTA_BUSY: If This bit is 1, then it indicates the delta processing engine is busy
29	R/W	0	AVG_BUSY: If This bit is 1, then it indicates the averaging engine is busy
28	R/W	0	SAMPLE_BUSY: If This bit is 1, then it indicates the sampling engine is busy
27	R/W	0	FIFO_FULL:
26	R/W	0	FIFO_EMPTY:
25-21	R/W	4	FIFO_COUNT: Current count of samples in the acquisition FIFO
20-19	R/W	0	ADC_BIAS_CTRL
18-16	R/W	0	CURR_CHAN_ID: These Bits represent the current channel (0..7) that is being sampled.
15	R/W	0	ADC_TEMP_SEN_SEL
14	R/W	0	SAMPLING_STOP: This bit can be used to cleanly stop the sampling process in the event that continuous sampling is enabled. To stop sampling, simply set This bit and wait for all processing modules to no longer indicate that they are busy.
13-12	R/W	0	CHAN_DELTA_EN: There are two Bits corresponding to Channels 0 and 1. Channel 0 and channel 1 can be individually enabled to take advantage of the delta processing module.
11	R/W	0	Unused
10	R/W	0	DETECT_IRQ_POL: This bit sets the polarity of the detect signal. The detect signal is used during X/Y panel applications to detect if the panel is touched
9	R/W	0	DETECT_IRQ_EN: If This bit is set to 1, then an interrupt will be generated if the DETECT signal is low/high. The polarity is set in the bit above.
8-4	R/W	0	FIFO_CNT_IRQ: When the FIFO contains N samples, then generate an interrupt (if bit 3 is set below).
3	R/W	0	FIFO_IRQ_EN: Set This bit to 1 to enable an IRQ when the acquisition FIFO reaches a certain level.
2	W	0	SAMPLE_START: This bit should be written to 1 to start sampling.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
1	R/W	0	CONTINUOUS_EN: If This bit is set to 1, then the channel list will be continually processed
0	R/W	0	SAMPLING_ENABLE: Setting This bit to '1' enables the touch panel controller sampling engine, averaging module, XY processing engine and the FIFO.

**SAR\_ADC\_CHAN\_LIST:Channel List 0x81**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-27	R/W	0	unused
26-24	R/W	2	Length of the list of channels to process. If this value is 2, then only channels in Bits [8:0] below are processed.
23-21	R/W	7	8th channel
20-18	R/W	6	7th channel
17-15	R/W	5	6th channel
14-12	R/W	4	5th channel
11-9	R/W	3	4th channel
8-6	R/W	2	3rd channel
5-3	R/W	1	2nd channel
2-0	R/W	0	First channel in the list of channels to process

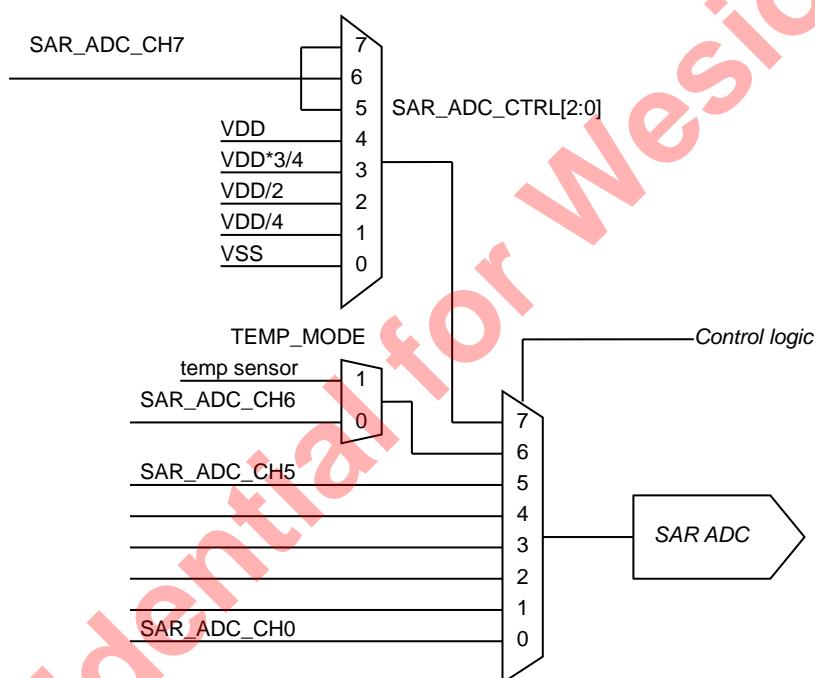

**SAR\_ADC\_AVG\_CNTL:Sampling/Averaging Modes 0x82**

Each channel listed in the CHANNEL\_LIST is given independent control of the number of samples to acquire and averaging mode

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-30	R/W	0	Channel 7: Averaging mode: 0 = no averaging, 1 = simple averaging, 2 = median averaging.
29-28	R/W	0	Channel 6: Averaging mode: 0 = no averaging, 1 = simple averaging, 2 = median averaging.
27-26	R/W	0	Channel 5: Averaging mode: 0 = no averaging, 1 = simple averaging, 2 = median averaging.
25-24	R/W	0	Channel 4: Averaging mode: 0 = no averaging, 1 = simple averaging, 2 = median averaging.
23-22	R/W	0	Channel 3: Averaging mode: 0 = no averaging, 1 = simple averaging, 2 = median averaging.
21-20	R/W	0	Channel 2: Averaging mode: 0 = no averaging, 1 = simple averaging, 2 = median averaging.
19-18	R/W	0	Channel 1: Averaging mode: 0 = no averaging, 1 = simple averaging, 2 = median averaging.
17-16	R/W	0	Channel 0: Averaging mode: 0 = no averaging. 1 = simple averaging of the number of samples acquired (1,2,4 or 8). 2 = median averaging. NOTE: If these Bits are set to 2, then you must set the number of samples to acquire below to 8.
15-13	R/W	0	Channel 7: Number of samples to acquire 2N:
13-12	R/W	0	Channel 6: Number of samples to acquire 2N:

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
11-10	R/W	0	Channel 5: Number of samples to acquire 2N:
9-8	R/W	0	Channel 4: Number of samples to acquire 2N:
7-6	R/W	0	Channel 3: Number of samples to acquire 2N:
5-4	R/W	0	Channel 2: Number of samples to acquire 2N:
3-2	R/W	0	Channel 1: Number of samples to acquire 2N:
1-0	R/W	0	Channel 0: Number of samples to acquire 2N: 0 = 1, 1 = 2, 2 = 4, 4 = 8.

### SAR\_ADC\_REG3: Control Register #3    0x83

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0	CNTL_USE_SC_DLY: hold time delay was added to the start conversion clock. Unfortunately, it appears that the analog ADC design requires that we use the inverted clock so This bit is meaningless.
30	R/W	0	SAR ADC_CLK_EN: 1 = enable the SAR ADC clock
29	R/W	0	reserved
28	R/W	0	reserved
27	R/W	0	SARADC_CTRL[4]: is used to control the internal ring counter. 1 = enable the continuous ring counter. 0 = disable
26	R/W	0	SARADC_CTRL[3]: used to select the internal sampling clock phase

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
25~23	R/W	0	SARADC_CTRL[2:0]: 000 ssa 001 vdda/4 010 vdda/2 011 vdda*3/4 100 vdda 101, 110, 111 unused
22	R/W	0	DETECT_EN: This bit controls the analog switch that connects a 50k resistor to the X+ signal. Setting This bit to 1 closes the analog switch
21	R/W	0	ADC_EN: Set This bit to 1 to enable the ADC
20-18	R/W	2	PANEL_DETECT_COUNT: Increasing this value increases the filtering on the panel detect signal using the timebase settings in Bits [17:16] below.
17-16	R/W	0	PANEL_DETECT_FILTER_TB: 0 = count 1uS ticks, 1 = count 10uS ticks, 2 = count 100uS ticks. 3 = count 1mS ticks
15-10	R/W	20	ADC_CLK_DIV: The ADC clock is derived by dividing the 27Mhz crystal by N+1. This value divides the 27Mhz clock to generate an ADC clock. A value of 20 for example divides the 27Mhz clock by 21 to generate an equivalent 1.28Mhz clock.
9-8	R/W	1	BLOCK_DLY_SEL: 0 = count 1uS ticks, 1 = count 10uS ticks, 2 = count 100uS ticks. 3 = count 1mS ticks
7-0	R/W	10	BLOCK_DLY: After all channels in the CHANNEL_LIST have been processed, the sampling engine will delay for an amount of time before re-processing the CHANNEL_LIST again. Combined with Bits [9:8] above, this value is used to generate a delay between processing blocks of channels.

### **SAR\_ADC\_DELAY:INPUT / SAMPLING DELAY    0x84**

As the CHANNEL\_LIST is process, the input switches are set according to the requirements of the channel. After setting the switches there is a programmable delay before sampling begins. Additionally, each channel specifies the number of samples for that particular channel. The sampling rate is programmed below.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-29	R	0	unused
28	R/W	0	CNTL_EOC_BY_CNT: ADC dout valid controlled by counter
27	R/W	0	CNTL_USE_LATCHED_DATA: ADC dout be latched first, then be sampled
26	R	0	unused
25-24	R/W	0	INPUT_DLY_SEL: 0 = 111nS ticks, 1 = count 1uS ticks, 2 = count 10uS ticks, 3 = count 100uS ticks
23-16	R/W	3	INPUT_DLY_CNY: For channels that acquire 2,4 or 8 samples, the delay between two samples is controlled by this count (N+1) combined with the delay selection in the two bits above.
15-10	R/W	14	CNTL_EOC_DLY_CNT: the delay between SC and ADC output data ready for latch/sample

Bit(s)	R/W	Default	Description
9-8	R/W	0	SAMPLE_DLY_SEL: 0 = count 1uS ticks, 1 = count 10uS ticks, 2 = count 100uS ticks. 3 = count 1mS ticks
7-0	R/W	9	SAMPLE_DLY_CNY: For channels that acquire 2,4 or 8 samples, the delay between two samples is controlled by this count (N+1) combined with the delay selection in the two bits above.

### SAR\_ADC\_LAST\_RD: Last Sample 0x85

For channel 0 and channel 1, (the special X/Y channels) the last sample pushed into the FIFO for each channel is saved in a register. This allows the software to see the last sample for channel 0 and channel 1 even when the FIFO overflows. For example, if we are sampling quickly and there is a gesture on the screen, we can use the contents of the FIFO to see the direction of the gesture and use the last sample values to see where the pen finally came to rest.

Bit(s)	R/W	Default	Description
31-24	R	0	unused
23-16	R	0	LAST_CHANNEL1
15-10	R	0	unused
9-0	R	0	LAST_CHANNEL0

### SAR\_ADC\_FIFO\_RD: Control Register #6 (FIFO RD) 0x86

Bit(s)	R/W	Default	Description
31-16	R	0	Unused
15	R	0	Unused
14-12	R	0	Channel ID. This value identifies the channel associated with the data in Bits [9:0] below
11-10	R	0	Unused
9-0	R	0	Sample value: 9-bit raw or averaged ADC sample written to the FIFO.

### SAR\_ADC\_AUX\_SW: Channel 2~7 ADC MUX, Switch Controls 0x87

Channels 2 ~ 7 can program the ADC input mux to any selection between 0 and 7. This register allows the software to associate a mux selection with a particular channel. In addition to the ADC mux, there are a number of switches that can be set in any particular state. Channels 2 ~ 7 share a common switch setting. Channels 0 and 1 on the other hand have programmable switch settings (see other registers below).

Bit(s)	R/W	Default	Description
31-26	R	0	unused
25-23	R/W	7	Channel 7 ADC_MUX setting when channel 7 is being measured.
22-20	R/W	7	Channel 6 ADC_MUX setting when channel 6 is being measured.
19-17	R/W	7	Channel 5 ADC_MUX setting when channel 5 is being measured.
16-14	R/W	6	Channel 4 ADC_MUX setting when channel 4 is being measured.

13-11	R/W	0	Channel 3 ADC_MUX setting when channel 3 is being measured.
10-8	R/W	1	Channel 2 ADC_MUX setting when channel 2 is being measured.
7	R	0	unused
6	R/W	0	VREF_P_MUX setting when channel 2,3..7 is being measured
5	R/W	0	VREF_N_MUX setting when channel 2,3..7 is being measured
4	R/W	0	MODE_SEL setting when channel 2,3..7 is being measured
3	R/W	1	YP_DRIVE_SW setting when channel 2,3..7 is being measured
2	R/W	1	XP_DRIVE_SW setting when channel 2,3..7 is being measured
1	R/W	0	YM_DRIVE_SW setting when channel 2,3..7 is being measured
0	R/W	0	YM_DRIVE_SW setting when channel 2,3..7 is being measured

### SAR\_ADC\_CHAN\_10\_SW:Channel 0, 1 ADC MUX, Switch Controls 0x88

Channels 0 and 1 have independent programmable switch settings when either/both of these channels are being measured.

Bit(s)	R/W	Default	Description
31-26	R	0	unused
25-23	R/W	2	Channel 1 ADC MUX setting
22	R/W	0	Channel 1 VREF_P_MUX
21	R/W	0	Channel 1 VREF_N_MUX
20	R/W	0	Channel 1 MODE_SEL
19	R/W	1	Channel 1 YP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
18	R/W	1	Channel 1 XP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
17	R/W	0	Channel 1 YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND
16	R/W	0	Channel 1 YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND
15-10	R		unused
9-7	R/W	3	Channel 0 ADC MUX setting

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
6	R/W	0	Channel 0 VREF_P_MUX
5	R/W	0	Channel 0 VREF_N_MUX
4	R/W	0	Channel 0 MODE_SEL
3	R/W	1	Channel 0 YP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
2	R/W	1	Channel 0 XP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
1	R/W	0	Channel 0 YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND
0	R/W	0	Channel 0 YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND

### SAR\_ADC\_DETECT\_IDLE\_SW:DETECT / IDLE Mode switches 0x89

#### IDLE MODE:

When nothing is being measured, the switches should be put into a safe state. This safe state is accomplished using Bits [9:0] below.

#### DETECT MODE:

When bit [26] is set, the input muxes / switches are configured according to the Bits below. Typically the software configures the switches below to correspond to the detect touch mode. That is, Y- internal MOSFET is closed so that the Y plane of the touch screen is connected to Ground. Additionally, the DETECT\_EN bit(different register) set to 1 so that the 50k resistor to VDD is connected to X+. In this configuration, the detect comparator connected to the 50k resistor will be weakly pulled up to VDD through the 50k resistor. If the user touches the screen, the X and Y planes of the touch screen will contact causing the X+ signal to be pulled to ground.

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-27	R	0	unused
26	R/W	0	DETECT_SW_EN: If This bit is set, then Bits [25:16] below are applied to the analog muxes/switches of the touch panel controller.
25-23	R/W	5	DETECT MODE ADC MUX setting
22	R/W	0	DETECT MODE VREF_P_MUX setting
21	R/W	0	DETECT MODE VREF_N_MUX setting
20	R/W	0	DETECT MODE MODE_SEL setting

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
19	R/W	1	DETECT MODE YP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
18	R/W	1	DETECT MODE XP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
17	R/W	0	DETECT MODE YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND
16	R/W	0	DETECT MODE YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND
15-10	R		Unused
9-7	R/W	5	IDLE MODE ADC MUX setting
6	R/W	0	IDLE MODE VREF_P_MUX setting
5	R/W	0	IDLE MODE VREF_N_MUX setting
4	R/W	0	IDLE MODE MODE_SEL setting
3	R/W	1	IDLE MODE YP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
2	R/W	1	IDLE MODE XP_DRIVE_SW setting: 0: TADC_CH6N = 3.3v 1: TADC_CH6N = floating
1	R/W	0	IDLE MODE YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND
0	R/W	0	IDLE MODE YM_DRIVE_SW setting: 0: TADC_CH4N = floating 1: TADC_CH4N = GND

**SAR\_ADC\_DELTA\_10:Delta Mode Deltas 0x8a**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31-28	R	0	unused
27	R/W		TEMP_SEL

26	R/W		TS_REVE[1]
25-16	R/W	0	Channel 1 delta value when delta processing for channel 1 is enabled.
15	R/W		TS_REVE[0]
14-11	R/W		TS_C[3:0]
10	R/W	0	TS_VBG_EN
9-0	R/W	0	Channel 0 delta value when delta processing for channel 0 is enabled.

**SAR\_ADC\_REG11: 0x8b**

Bit(s)	R/W	Default	Description
31-30	R/W	0	unused
29-13	R/W	0	ts_cntl_int
12-0	R/W	0	sar_bg_cntl

**SAR\_ADC\_REG12: 0x8c**

Bit(s)	R/W	Default	Description
31-0	R/W	0	reserved

**SAR\_ADC\_REG13: 0x8d**

Bit(s)	R/W	Default	Description
15-8	R/W	0	SARADC_RSV2
7-0	R/W	0	reserved

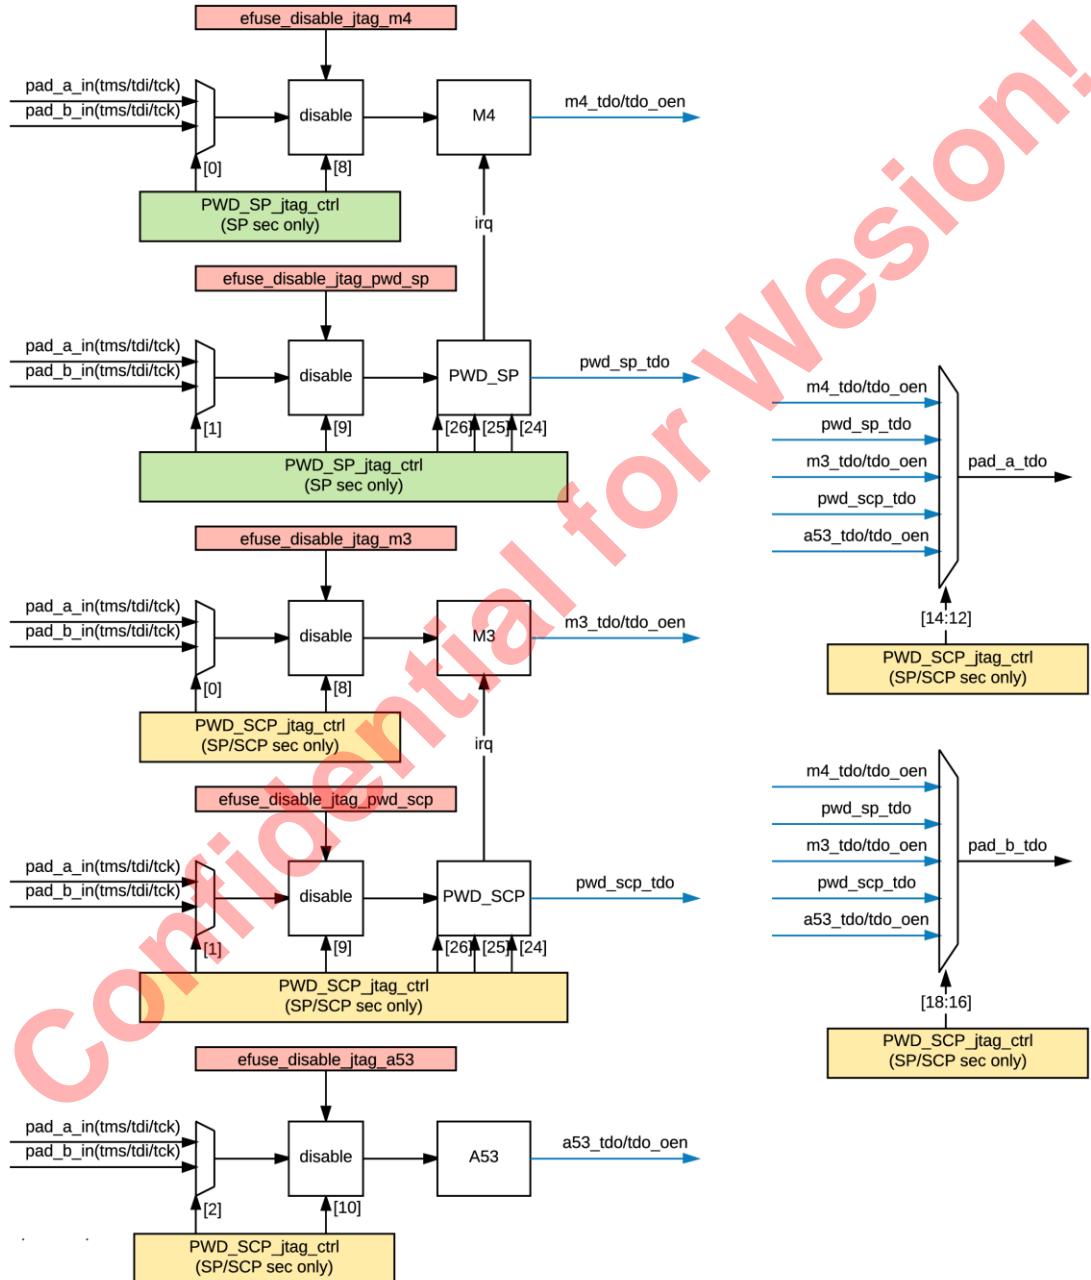

# 15. System Interface

## 15.1 JTAG

### 15.1.1 Overview

JTAG is an interface for internal test. The structure of A311D JTAG module is shown in the following diagram:

Figure 15-1 Diagram of JTAG

### 15.1.2 Register Description

Base address: 0xFF800000

Register address: 0xFF800000 + offset \* 4

**AO\_SEC\_JTAG\_SP\_CTRL 0xac**

<b>Bit(s)</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

## 15.2 Temp Sensor

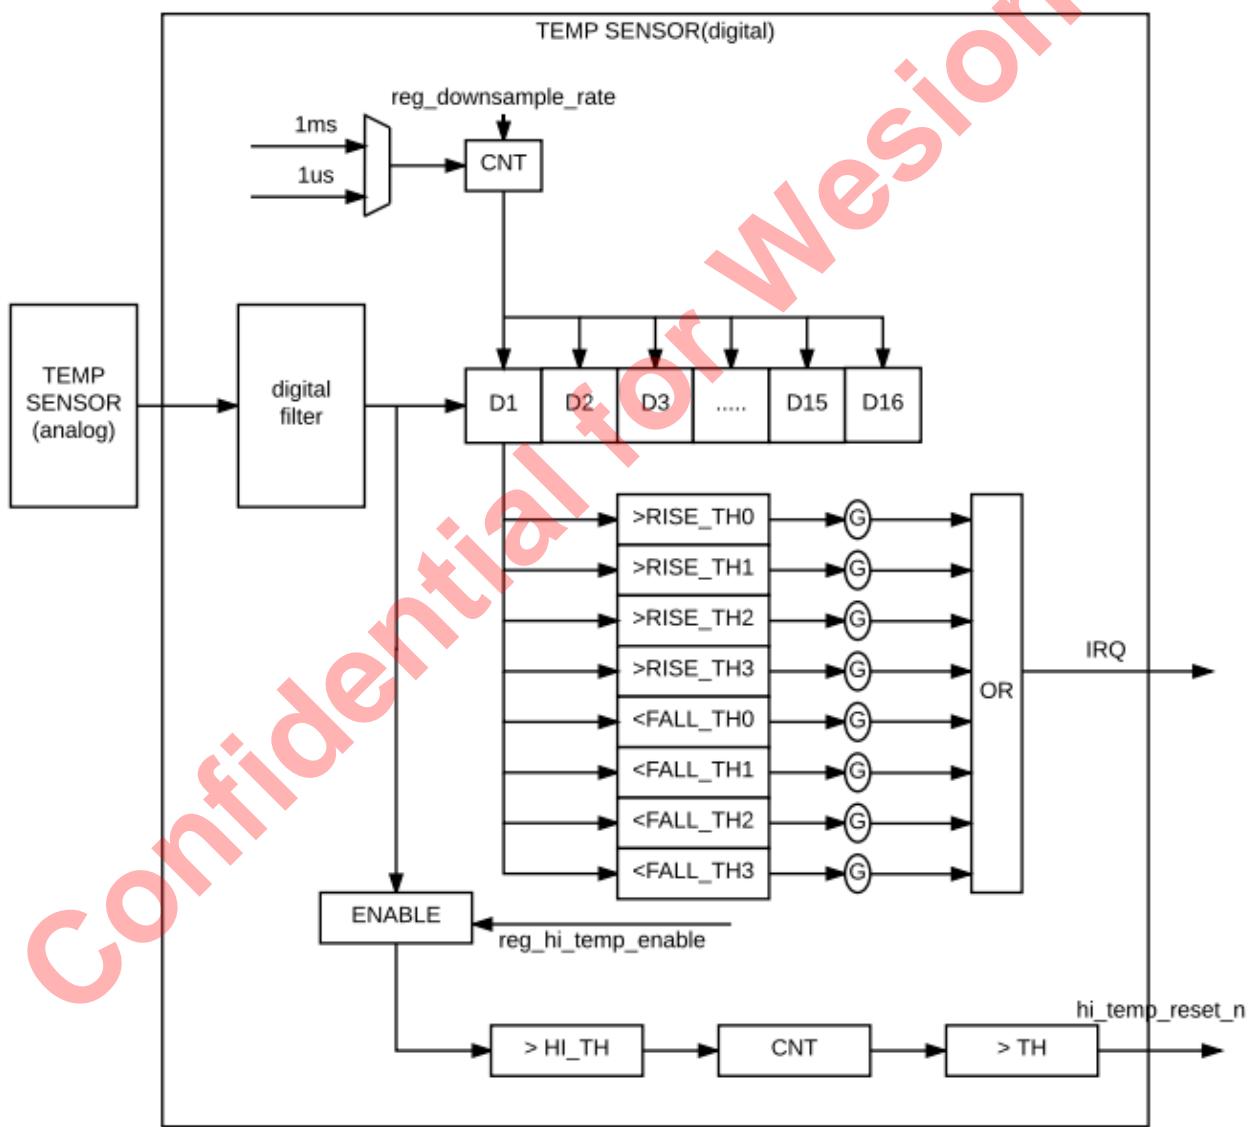

### 15.2.1 Overview

A311D integrates 2 Temp Sensor, one is close to DDR, one is close to PLL (between CPU and GPU).

Each Temp Sensor are the same design.

1. Capture temperature by programable tick;
2. Store 16 temperature value;
3. Can reset all chip if detect high temperature;
4. Can generate IRQ by 8 threshold;

**Figure 15-2 Temperature Sensor Diagram**

### 15.2.2 Register Description

#### 15.2.2.1 Temp Sensor PLL Registers

Base Address: 0xFF634800

Each register final address = module base address+ address \* 4

### 15.2.2.2 Temp Sensor DDR Registers

Base Address: 0xFF634C00

Each register final address = module base address+ address \* 4

#### TS\_CFG\_REG1 0x001

Bits	R/W	Default	Description
31	R/W	0x00000000	fall_th3_irq_en
30	R/W		fall_th2_irq_en
29	R/W		fall_th1_irq_en
28	R/W		fall_th0_irq_en
27	R/W		rise_th3_irq_en
26	R/W		rise_th2_irq_en
25	R/W		rise_th1_irq_en
24	R/W		rise_th0_irq_en
23	R/W		fall_th3_irq_stat_clr
22	R/W		fall_th2_irq_stat_clr
21	R/W		fall_th1_irq_stat_clr
20	R/W		fall_th0_irq_stat_clr
19	R/W		rise_th3_irq_stat_clr
18	R/W		rise_th2_irq_stat_clr
17	R/W		rise_th1_irq_stat_clr
16	R/W		rise_th0_irq_stat_clr
15	R/W		1: enable IRQ related function.
14	R/W		fast_mode: 0 : downsample unit = 1ms; 1: downsample unit = 1us;
13	R/W		clr_hi_temp_stat
12	R/W		ts_ana_rset_vbg reset vbg(set 0, if have error place set it plus 01000..)
11	R/W		ts_ana_RST_SD reset adc(set 0, if have error place set it plus 01000..)

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
10	R/W		ts_ana_en_vcm enable vcm (disable:0; enable:1)
9	R/W		ts_ana_en_vbg enable vbg (disable:0; enable: 1)
8:7	R/W		filter hcic mode 0: downsample rate = 128; 1: downsample rate = 256; 2/3: downsample rate = 512;
6	R/W		filter ts_out_ctrl; 1: add more delay for filter lock;
5	R/W		filter en(disable:0; enable:1)
4	R/W		ts_ana_en_iptat, useless.
3	R/W		Temp Sensor DEM enable. (disable:0; enable:1)
2:0	R/W		Bipolar bias current input control. recommend value : 3. ts_ana_ch_sel; 0: 8'b00000001; 1: 8'b00000011; 2: 8'b00000111; 3: 8'b00001111; 4: 8'b00011111; 5: 8'b00111111; 6: 8'b01111111; 7: 8'b11111111;

**TS\_CFG\_REG2 0x002**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>
31	R/W	0x00000000	hi_temp_enable
30	R/W		reset_en, if = 0, will not reset all chip;
27:16	R/W		high temperature times, if continuous detect high temperature, then will reset all chip.
15:0	R/W		high temperature threshold, if temperature value > this th , mean detected once high temperature

**TS\_CFG\_REG3 0x03**

<b>Bits</b>	<b>R/W</b>	<b>Default</b>	<b>Description</b>

31:16	R/W	0x00000000	
15:0	R/W		down_sample rate

**TS\_CFG\_REG4 0x04**

Bits	R/W	Default	Description
23:12	R/W	0x00000000	rise_th0
11:0	R/W		rise_th1

**TS\_CFG\_REG5 0x05**

Bits	R/W	Default	Description
23:12	R/W	0x00000000	rise_th2
11:0	R/W		rise_th3

**TS\_CFG\_REG6 0x06**

Bits	R/W	Default	Description
23:12	R/W	0x00000000	fall_th0
11:0	R/W		fall_th1

**TS\_CFG\_REG7 0x07**

Bits	R/W	Default	Description
23:12	R/W	0x00000000	fall_th2
11:0	R/W		fall_th3

**TS\_STAT0 0x10**

Bits	R/W	Default	Description
31:18	R	0x00000000	detect_hi_temp_cnt
17	R		detected_hi_temp_stat
16	R		filter lock
15:0	R		filter out

**TS\_STAT1 0x11**

Bits	R/W	Default	Description
31:9	R	0x00000000	
8	R		hi_temp_stat
7	R		fall_th3_irq

6	R		fall_th2_irq
5	R		fall_th1_irq
4	R		fall_th0_irq
3	R		rise_th3_irq
2	R		rise_th2_irq
1	R		rise_th1_irq
0	R		rise_th0_irq

**TS\_STAT2 0x12**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D2
15:0	R		temperature value D1

**TS\_STAT3 0x13**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D4
15:0	R		temperature value D3

**TS\_STAT4 0x14**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D6
15:0	R		temperature value D5

**TS\_STAT5 0x15**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D8
15:0	R		temperature value D7

**TS\_STAT6 0x16**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D10
15:0	R		temperature value D9

**TS\_STAT7 0x17**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D12

31:16	R	0x00000000	temperature value D12
15:0	R		temperature value D11

**TS\_STAT8 0x18**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D14
15:0	R		temperature value D13

**TS\_STAT9 0x19**

Bits	R/W	Default	Description
31:16	R	0x00000000	temperature value D16
15:0	R		temperature value D15
